APPLETONS' JOURNAL

OF LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 93.—Vol. V.]

SATURDAY, JANUARY 7, 1871.

PRICE TEN CENTS.
WITH SUPPLEMENT.

YOUNG AMERICA AT HIS WINTER SPORTS.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER I.

"MY own child; yes, nurse, that's true; but no truer than that it's his child. His son! And I tell you, nurse, there are times when it wouldn't be safe for me to be alone with it; if a look of him should come into its eyes, I might kill it, for hate, and for fear!"

She was only answered by a sigh.

They were sitting in the farm-house kitchen—the kitchen of Moor-Edge, or, as it is more commonly called, Murrigge Farm-house. A gray, substantially-built, many-gabled house, with heavy stone-mouldings above, mullioned and diamond-paned lattices, and an ample stone porch. One end of the house is covered by a century-old pear-tree. In front it has a patch of smooth, fine turf, traversed by flagged paths, walled in by a low and broad-topped wall. In the afternoon, the shadows of the wind-blown orchard-trees stretch half across this green: in a corner, to which those shadows never reach, stand a group of ash-trees. When the sun shines, the aspect of the place is cheery, its grays are warm, and its greens full of a suppressed glow; but in winter, and in dead, dull weather, it looks austere and gloomy. A vast common stretches northward, behind the farm. From the little-used front gate a steep and rough footway, that in winter-time is often nothing but an impetuous water-course, precipitates itself toward the far-below lying plain.

They were sitting close to the lattice, and the July moon was just lifting itself slowly to shine on them through the ash-trees. The casement stood wide open, and let in an evening air, that was full of perfumes: from the sun-burnt woodbine that was hanging round the porch, from a group of sunburnt lilies beneath the window, which would now bleach again in the moonlight, and from late-lying sunburnt hay on a sloping meadow out of sight.

The woman who had spoken had a face which, in that mysterious mingling of twilight and of moonlight, looked softly girlish. She was dressed in lustreless black. The other, whom she had called "nurse," who had answered her only with a sigh, was middle-aged, and comely, and sad-eyed. She, too, wore black; she sat in an old-fashioned, cushioned chair, and rocked in her arms a scarcely three-months'-old child.

There was a long silence, broken only by occasional noises from the farm-yard, by the rustling of leaves, and the tranquil breathing of the sleeping child.

The moon had climbed a good way above the ash-trees, tinting the clear sky a rose-tinged lilac, before either of them spoke. Then it was the older woman, with tender deference, and, at the same time, with the sort of caution one unconsciously uses toward the mentally sick: feeling the way, to find how much can be ventured, how much can be borne.

"All this day you've been thinking, and it's not much else, indeed, that I've done; thinking about the letter. May I tell you my mind, my dearie, before you tell me yours?"

As if aware that the silence had been broken without being aware what had been said, the other answered, not what was now said, but something she had let pass unanswered long before.

"But for it," with a gesture toward the child, "I never should wish to leave you. There would be no reason why I should ever leave you. I would stay here always, till I die. If it hadn't lived, as I hoped it mightn't, or if you'd sent it away, as I thought you would, somewhere where I need never have seen it, nor heard of it again, then, oh so thankfully, I'd have stayed here always. But it did live, and you say you can't send it away; you say it comforts you for the loss of your own, so, as it must stay, I must go."

"Comforts me! Ay, indeed does it! And it would comfort you, as nothing else in this world ever can, if only you'd not harden your heart against it."

With no notice of this interruption, beyond a slight shiver of disgust, the girl went on:

"So, as I must go, as I can't stay here always, as I can't hide myself here, out of the world, till I die, I'll try and lose myself in the world. I'll separate myself from you, though you're the only creature I love, and that loves me; I'll go to some strange place with this strange woman; I'll try and forget you, with all else that belongs to the past. I'll strip off my wedding-ring and my widow's mourning, and try to

strip off the memory of what they stand for; I'll deny, even to myself, that I've worn either. Widow's mourning! as if I could mourn for him! No, but I mourn for myself, for my life that he soiled and spoiled, so that for me there's neither memory nor hope; the very air I breathe is poisoned. It seems to smell sweet to-night," she said, lifting her face, and looking out. "To you it does smell sweet, nurse; doesn't it? But to me there's still the smell of blood in it, the sickening smell of blood!"

The other sorrowfully noticing the growing excitement of voice and the wandering wildness of eye, only sighed out:

"It's terrible to hate the dead."

"Let me forget, then, and I shall leave off hating."

"It may be God's will that you should remember and forgive."

"Forgive!" she echoed.

Another pause, and then the girl spoke again:

"If I put all my heart, and soul, and strength into one prayer—to be able to forget—I can't think but God will hear me. It isn't much to ask, to forget, only to forget, yet it's all I ask. Though I'm young still, I don't ask joy or hope, but only to forget."

"There's one thing you can't forget. One thing you can't strip off you, or tear out of you, or bury away from you. There's no stone heavy enough to keep it down. It's the mother's heart that's in you, and that, one day, will stir and wake. If, one day, you marry again, and bear other children—"

"Marry again! Bear other children! Never! I will never own that child, or my hateful marriage. These unowned things will stand always between me and love. Love! What do I want with love? What have I to do with love? I want only peace—peace, and to forget."

"You feel like that now; but, as you say, dearie, you're young; you may have long to live, it's dreary to live always alone. If only you'd not take a lie upon you. Ah, Miss Daisy"—the once familiar name in her earnestness slipped out unawares—"don't do it, don't do it. There was one, as once loved you, I always believe will never rest till he finds you!"

"You're mad, nurse! you're mad! Do you think I'd feel myself fit for him, ever, on this side the grave? As for my being young—I am not young. I can never be young any more. When I see myself in the glass, I wonder that my hair isn't white, that my flesh isn't shrivelled, that my eyes are not dim, that my face doesn't tell of the horrible things it has looked upon."

"But it's not so. Men will see it's not so. In time you'll come to feel it's not so; some spring the blood will dance in your veins, and the world will seem beautiful, and you'll feel that, cost what it may, you must love and be happy before you die. And what's to hinder? If only you'll be patient till this madness of misery is past, and not take a lie upon you. What, but pity, could any good man feel for—"

"It's what I feel about myself that would hinder," the girl broke in; "but it's no use talking. My mind is made up. I shall go to her."

"I wish no better than that you should go to her, dearie; but as what you are, not with a lie upon you. Leave the child with me yet a while, as is needful for it, and best for you; but go to her as a widow and a mother."

"I will not. She knows nothing of me but my maiden name, the only name I will ever own. She is alone, and she is dying; because she loved my mother she sends for me, begging me to be with her till she dies. I shall go to her. She promises to leave me all she has. I shall be rich again. It shall all be for you, nurse. I shall ask nothing of you but to keep that child always, letting it grow up as your own."

"You call evil days upon yourself when you take a lie upon you. If any thing I could say could turn your heart from doing it, God put it in my heart to say that thing!"

"Evil days!" she echoed, with a wild little laugh. "What evil can seem to me evil any more; what bitterness bitter?"

"And it's all vain trying," the older woman went on. "You can't forget your child. The mother's heart is in you. Sooner or later it will waken. It will trouble you when you think you've found peace. My dearie, my dearie, better than you know yourself I know you."

"The Scripture says a woman can forget her child. If any woman, surely I, to whom the father of that child was hateful."

"It won't be so. Better than you know yourself, indeed, I know

you. The tender heart that was like a mother's to the baby-brother won't remain dead and cold to its own flesh and blood."

"Oh, my brother! Oh, Wattie, Wattie, Wattie! All the rest I could, perhaps, have forgiven him, but not your death." She broke now into passionate wailing.

When she looked up and spoke again her face was harder, her tone harsher than it had been before, and her eyes had a fierce expression in them.

"You couldn't better quicken my hate for him, and so my loathing for his child, than by speaking to me of my young brother," she said. "When I knelt on the wet, river-side grass by Wattie—my dead, drowned, murdered Wattie—didn't I curse that child's father? Didn't I vow—"

"You were mad, you were mad! God, in His mercy, would take no heed of you. You were mad then; you are mad now. If only you'd wait and do nothing till the fever-fire has burned out of your poor brain! My dear, my dear, turn your back upon the devil; shut your eyes and your ears to the things he shows you and tells you; put all these horrible thoughts from you; turn to good things and to God."

"Well," she answered, with a daft sort of smile, "the devil is dead, certainly—didn't I see him die? But, nurse, not the devil only, but God also is cruel, if He won't let me forget."

"If only you'd take this little one He sent you into your arms, and let it lie against your heart, gentler thoughts would come. It turns my blood to hear you talk, and see you look with loathing upon this soft, sweet, tender, helpless thing, and it your own, too."

The child, awake now, was lying on the woman's lap. It turned its head upon her knee, and fixed its eyes upon its mother's face. The little dark-eyed baby-face looked elfish and wan in the moonlight.

"His eyes, his eyes!" the girl cried out, as if in some intolerable torture. And she sprang up, and went away out-of-doors.

"They're no eyes but your own, your very own. It's its mother's child all over, the darling, the darling!" the woman crooned over it.

It was not long before the girl came back. Seeing, by the clear moonlight, that the woman's tears were falling thick and fast, she went behind her, twined an arm round her neck, laid her cheek against the tear-stained cheek, and whispered:

"Poor, poor nurse, poor, dear nurse, you're thinking of your own poor little baby, nurse."

"Thinking of my own lost pretty one that I loved so, that John loved so, and that's lying now in the church-yard. Thinking of it, I'm sorry for myself, and I'm sorry for John, and I could cry my heart out for the pity of it; but, as for this poor outcast from its mother's love, tears aren't sad enough, nor bitter enough, to shed for it."

"It will have you, nurse. You'll be a better mother to it than I could ever be."

"And if I die? And I'm not strong as I used to be, my dear. Sometimes I think I'll never be well any more."

"If you die," the girl repeated, slowly. "Why then it will very likely die, too; perhaps it may die first, even." Then she suddenly asked, pointing to the child's white dress, "Is there blood there, nurse? Or is it only in my brain?"

"Your head's getting bad, my dear. Can't you leave it all now, and let us settle it to-morrow?"

"It's all settled, nurse. I go away, and you keep the child. He's to grow up loving you as his mother, and in time you'll forget he's not your own son."

"And then, when I love him as my own, you'll come to your right mind. And then you'll so yearn for your little child, that you'll feel forced to claim him, if from the other side the world you had to make your way to him on your knees!"

"Nurse," the girl spoke, at once imperiously and coaxingly, "leave off talking of this. It tires me; it does me harm. And, nurse, put it away now, the child; lay it in its cradle. I want to be close to you, I want you to pet me this last night. Who knows when we shall be together again?"

"Hold the child a moment, then, while I go and put its things ready."

"I will not!" was the first answer, followed by, "you can put it here."

She sat down in the chair from which the other had risen, and let the child be laid upon her lap.

She did not mean to look at it; but, in her own despite, her eyes soon fixed themselves upon the sleeping face. She touched one of the tiny hands, and it closed upon her finger, and that instinctive, trustful clasp thrilled her.

"Ah, but he, too, must once have been helpless and harmless," she thought. "Even he must once have lain upon his mother's knees and looked soft and sweet, and this is his son! As well as another I could have loved a child. How I loved baby Wattie!"

Dreaming back upon her tender, girlish days, when that little brother had been to her as her very own, and her all, she lifted the sleeping child, her own little son, to her shoulder, pressed her cheek against its cheek, and so, gently swaying to and fro, dreamed on, till she came, in her retrospective dreaming, to the very last memory of Wattie, lying by the river-bank, dead, drowned.

Recalled to herself, to the present, she hastily snatched the child from her shoulder, got up from her chair, and laid the frightened, awakened creature on the cushions.

"His son. The son of Wattie's murderer! And I was holding it as if I loved it.—Nurse!" she called, aloud, "come and take it. Put it out of my sight."

Nurse, who had been on the watch, came quickly and took the child away.

When she returned: "It's not to-morrow you go, for sure, dearie!" she said. "What did you mean about this being the last night?"

"Sit in the great chair again, nurse, I want to sit by you and lay my head in your lap. That is it. Yes, nurse, I go to-morrow. If you look into my room you'll see my dress laid ready. I leave all this," looking down at her heavy, black gown, "and every thing else almost, behind me. The dress I've put ready is Daisy Morrison's; it was hers before she was dragged into the pit. It was never worn by his wife."

"And your ring, your wedding-ring. It should be taken care of if you don't mean to wear it. The day may come when—"

"Good nurse, no prophesying; a little peace. As to the ring. Take it off."

"Nay, my dear, not I!"

"You superstitious woman."

She wrenched it off herself, and threw it into the woman's lap.

"To think," she said, "that only a few weeks before he put that on me, I almost fancied I loved him! Almost fancied! It was never more than that, and I had wholly unfancied that fancy before I was plunged into it all—and oh, after that, how I loathed him! Life will be hell if I can't forget, if there's always to be the taint of those months all about me."

Her head on the woman's knees, her hand clasping her hand, Daisy presently said:

"Nurse, you've never asked me to tell you all about it."

"Dearie, I know enough," was soothingly answered.

"You don't know enough if you don't know all. Some one should know all. There is no one but you, and there is no time but to-night."

"Indeed, in one way or another I know enough, my dear. Don't speak of it, don't think of it, to-night."

But the woman's reluctance to hear strengthened the girl's determination to tell.

"You remember," she began, "he used sometimes to row up the river to our garden and try to tempt Wattie into his boat. One evening—it was very soon after that other you spoke of went away—that other—other, indeed!" Here she seemed to fall into a dream, but soon rousing herself went on. "One evening he was there, and Wattie was in his boat before I knew. 'Come, Sister Daisy, we're waiting for you,' my darling called to me. I wouldn't trust him alone. I couldn't bear to make him get out. Graham promised to bring us back in half an hour. I got in. We never came back. He murdered Wattie, and did worse by me. That devil's cunning—you start to hear me say that bad word! You goose of a nurse, if you only knew what sort of words and things I've heard and seen since then. That devil's cunning had planned it all. If he hadn't had Wattie he'd have failed. I'd have jumped into the river sooner than I'd have gone. Because there was something in his face that made me more afraid of him than of the river."

"He said the tide didn't serve to take us back; that we must go on to the first village, and drive home from there. It got dusk; we

were past the safe part of the river. I sat clutching Wattie. There was a shock. I know I kept hold of Wattie till he was wrenched from me. His death was murder. Nothing was accident. It was murder! There came the cool swirl of water, and then I knew nothing more till the morning of the next day. I was in a strange room, a strange woman sitting beside me. As soon as I could understand any thing, I asked for Wattie.

"The creature didn't know any thing; she said she would call the gentleman; but I wouldn't let her. I said I would go to him. My clothes had been dried, she helped me to put them on, and helped me to go down-stairs. I loathed her touch, even the touch of her eyes; but I couldn't have done without help, I was so deadly ill. Graham was at breakfast. He pretended to be shocked to see me looking so ill. He tried to be fond and tender. I would say nothing, and answer nothing, only asked, 'Where's Wattie?' He swore to me that Wattie had been sent safely home. Then, when I said I wished to go home to him directly, he— You know, nurse, I was such an ignorant fool, and he always so clever; and just then what little sense I ever had seemed benumbed. I felt, I remember, as if my mind were in a small prison, and knew nothing of any thing outside, of any before or after. He pretended passionate remorse, and love, and pity. And he confused me with shame and perplexity, by representing what had happened in the most disastrous light.

"Now, I can't believe in my own stupidity then. But he managed then to make me believe that I had no alternative but to be his wife, or to be pointed out by the finger of scorn, to lead a shamed life. He told me that nobody would ever credit that my having been away from home all night with him was an innocent accident.

"Nurse, don't you think it strange that God should let such a weak creature be left so helpless from no fault of her own? It was love for Wattie, care for Wattie, nothing else, Heaven is my witness, that led me into that villain's power.

"Well, when he'd done talking, I was even so stupid a fool as to feel something like gratitude to him for being willing to marry a girl so disgraced.

"We were married that very morning—as he had intended we should be. He wanted to hurry me abroad immediately. When I insisted that first I would go to Wattie, or Wattie must come to me, he left me in anger, and he locked me in. He turned the key very softly, but I heard the sound. My brain was, by this time, growing clearer. What had passed seemed to me an incredibly bad dream. The thought that I was his wife, irrevocably his property, half maddened me.

"I determined I would escape; that, whatever might come after, I would go to Wattie. I hadn't much trouble in getting out of the window. I passed unnoticed through the garden, which ran down to the river's edge. I thought I could make my way home by the river-side path.

"Pushing through some bushes, I suddenly came upon a group of people—my husband one of them—standing round something that lay on the grass. I broke into their midst, and there lay Wattie, my dead, drowned, murdered Wattie. I knelt by him, I lifted my hands and my eyes to heaven. Words of cursing came to my lips. I cursed his murderer, my husband, to whom I had been married that morning."

She stopped and laughed.

"I don't know what happened just after. I remember I found myself his close-kept prisoner. Our hatred of each other grew finely. He was disappointed in finding he could not get hold of all my money at once, mine and Wattie's, which came to me. He took a sort of fiend's pleasure in making himself as evil a monster as possible in my eyes. To half kill me with fear was his favorite pastime; but after a while I got too stupid to feel afraid. At times he drank frightfully—drank till he was mad. His worst way of torturing me was to talk to me of the foul horrors of the life he had led and was leading; if I tried to stop my ears, he would pull my hands down and hold them. Sometimes he struck me—not often—he could do so much worse. It's a nice story, isn't it, nurse?"

The poor woman to whom she told it moaned faintly.

"I'll make it short, nurse; I won't tell you half—only the end. That came at Ilomburg. I'm not quite sure if he meant to do it. But I think he did. A woman he cared something for had used him ill; besides that, he was in all manner of debt, and difficulty, and disgrace. It was in my room, before my eyes, close to me. He was playing with his pistol. He said he was going to shoot himself, but couldn't make up his mind if he would shoot me first or not. I had

heard him talk so before; I tried not to seem afraid. I saw him put the pistol to his mouth. When he did that I turned my eyes away. There was a noise. I felt something on my face and hands. I looked then, and didn't know what it was I saw. What, nurse, you turn faint to hear of it?

"I don't know much what happened after; or of how I got here. I had just written to you, I know. I suppose the address upon the letter—any way, I got here, and his child was born. And you want me to love it! To love his child!" She laughed wildly.

It was now just midnight, and the sound of a horse's footfall ("John" coming home from a distant market-town) was very welcome to John's poor wife. The girl rose quickly on hearing it to hurry to her own room.

"John will go with you to-morrow," were "nurse's" last words.

"Will he? There's no need he should take the trouble; but it's very kind. Thank him for me. Be sure you thank him for this kindness, and for all his other kindness."

Then, as the farmer entered the kitchen, Daisy fled up the stairs to her room. She had never met him face to face; she never would meet any one. Having put out the candle and drawn up the blind, she sat still until the old-fashioned clock outside her door had ten times chimed the quarters. As it finished its tenth chime she got up, and, moving about noiselessly, put off her widow's weeds, and put on the dress laid ready on the bed.

By the time this was done the dawn had overgrown the moonlight, and she looked at herself in the glass. There she stood—Daisy Morrison, Wattie's "Sister Daisy."

Stealing noiselessly down the stair, letting herself out of the house cautiously—it was easy to make no noise, the doors at Moor-Edge were neither locked nor barred, and the old dog sleeping by the kitchen hearth knew her too well to notice her, except by a sleepy movement of his tail—Daisy passed, before sunrise, into the world of summer-dawn. She did not take the track leading to the white road that crossed the common; she would have been, by-and-by, liable to meet people there, and could be seen from so great a distance. She took the footway that descended precipitously to the plain, between the high hedges. It was as yet too early to meet even laborers going to their work. As yet no smoke from early-lighted fires curled from the cottage chimneys. The world of dawn was stainless and speckless.

The ambrosial morning freshness, and the feeling that she was leaving behind her the widow's dress, the wedding-ring, the child, which were the signs of what had been so loathsome in her life, had a strong effect upon Daisy. It was with an elastic, almost dancing, step that she went her way; she felt as if, bathing in the purity of the dawn, she were being cleansed.

"I shall be able, in time, to forget. In so beautiful a world I shall be able, in time, to be happy! No need to hate this beautiful world, for I shall be able to forget—and—he is no longer in it."

By-and-by, she paused, turned, and looked back at Moor-Edge, just before finally passing out of sight of it.

"But if what she says is true—about a mother's heart—then I carry my trouble with me, within me. A mother's heart! How can I have a mother's heart for his child?"

The new glory had faded when she went on again. Whether she looked up to the clear morning blue, or looked before her through the clear air down upon the plain, her child's face, with eyes pleading and reproachful, floated before her; but she went on.

[TO BE CONTINUED.]

MADAME DE LISLE; OR, HOW I LEFT PARIS IN JULY, 1870.

AT the beginning of July, 1870, I was residing in Paris in the second story of No. 51 Avenue Montaigne. My back-windows looked out upon a queer little villa of the Louis XIII. style, with a gravelled court in front, and a garden full of trees behind, the only access to which from the avenue was by a narrow passage, which you entered by a small gate, over which was inscribed, in modest characters, "No. 49."

I discovered, soon after I took my lodgings in No. 51, that No. 49 was occupied by Madame de Lisle, the widow of a French officer who had been killed in the Crimea, or at Solferino, or somewhere or other,

I saw that she was handsome and distinguished in her personal appearance, and I soon learned that she moved in the best society, and was generally regarded as a brilliant woman of fair reputation and a comfortable income. Her origin seemed to be uncertain. Some said she was English, others that she was an American from South Carolina, and others still that she was a German. I had become tolerably familiar with her face from my back-windows, and at length had the honor to be introduced to her at a party at the British embassy. She seemed to recognize me as a neighbor, and smiled graciously, but made no observation beyond a few formal remarks.

Those early July days were stirring ones in Paris. Something was in the air—the mutterings before the storm. Ollivier was important, and the Chambers restless. The Quartier Latin was in a suppressed tumult all the time, the emperor was ill, and all sorts of reports were afloat. Then came the Spanish complication, the Hohenzollern business, and the Benedetti affair, and, behold! we were plunged into war with Prussia.

The effect was fine. All the turbulent elements rushed to arms. Serious people saw through the emperor's attempt to make a diversion, but were rather disposed to encourage it. The troops were summoned, and Le Boeuf marched to the frontier. Those who remained at home prepared triumphal arches, and shouted, "On to Berlin!"

My most intimate acquaintance among the French was a student named Bourgogne. Poor Jules! he was always bursting into my rooms with some exciting narration, and it was he that brought me the news of the enthusiasm of the students' quarter, and the rallying of all classes at the prospect of glory to be easily won from the slow and stupid Teuton.

"Our boundaries are to be rectified at last!" he shouted. "The eagles of France shall build their nests in the Siebengeberge."

"Fair and softly, my good friend," I would say, for I had not forgotten my winter in Berlin, and the drillings of the *landwehr*, and the needle-gun experiments. "Your German is an ugly fellow to rouse; he is like General Scott's description of the Yankee: 'The hardest fellow in the world to get into a fight, and the hardest to get out of it when his blood is up.'"

"He lacks *élan*," dogmatized Bourgogne, after the manner of Young France. "It is all very well to talk of Prussian against Austrian, but wait till they measure swords with France. Our first victory will rally to our standard all the nations of South Germany, trampled under the iron heel of Bismarck. Cochon!" hissed Jules, getting excited, "à bas la Prusse!"

I warded off a discussion by alluding to my neighbor Madame de Lisle, knowing that a spice of romance will divert a Frenchman from his most glorious theories, and for a while Bourgogne consented to drop the subject of chassepots and needle-guns, to look out of my window upon the villa, and take a comprehensive survey of the premises; but his ardent soul soon returned to the charge, and he ended by dragging me out to witness a grand review of the Army of the Rhine on the Champ de Mars.

We found the Pont de Jena blocked with blouses. The Faubourg St-Antoine was taking a holiday like ourselves, and the few police-officers on the spot had their hands full.

A carriage that was traversing the bridge seemed to give umbrage to the mob, and one or two were shying sticks at the driver, and a rude *ouvrier* was trying to put his head into the window.

"Mon Dieu! there is a lady within," shouted Bourgogne, indignant, as he sprang forward to avenge the insult. I followed closely. There were a few hard knocks, a thunder of *sacres*, the police came up, and the throng divided, leaving a clear space through which the carriage passed rapidly.

I caught a glimpse, as the horses sprang on, of a tranquil face smiling serene recognition, and then Bourgogne and I had as much as we could manage in evading the wrath of the blouses, and eluding the vigilance of the *sergents de ville*, which we finally accomplished by slipping through the crowd, and escaping pursuit by dexterous celerity. We found ourselves at last, very hot and tired, upon the Champ de Mars.

"Mais, quelle course de chien!" panted Bourgogne, wiping his brow, "but what a face! I am sure I have seen it somewhere. Beautiful as a thousand devils! She must be discovered."

"That will not be difficult," I said, smiling at his enthusiasm. "It was my fair neighbor."

"En effet," said Bourgogne, stopping short, and looking at me

curiously. "She recognized you, and smiled; and it was not my fine eyes, after all, that she appreciated. Ah, you are a *fine mouche*, my boy, and here I break my head and my shins to procure an adventure for you. Bien; but, mark me, I shall go with you to the first reception of madame that you attend, by this lance, broken in the service of yon distressed dame." And he ruefully raised his splintered rat-tan, and brandished it before my eyes.

Laughing at his absurdity, I promised to present him at my first appearance.

The review over, I left Bourgogne to find his way homeward by the left bank of the Seine, while I returned slowly to my lodgings.

Upon my table lay a dainty, perfumed missive, sealed with a crest. I opened it in haste, and found it was written in my own language:

"Madame de Lisle begs Mr. — to allow her the privilege of thanking him in person for his timely assistance this afternoon."

Enclosed was a French card of invitation, signifying that madame was to be found *chez elle* on Tuesday evenings.

That day was Monday.

The next morning when Bourgogne appeared as usual with the latest bulletin from the Place de Carrousel, I showed him the card.

"Of course, I am included in the invitation," he said, "and the only difficulty in my way is the want of a dress-coat."

"But how can I present you?" I demurred. "I am a stranger to this lady. I cannot ask permission to bring a friend."

"Nothing is more simple," demonstrated Bourgogne, unabashed, "if I can only procure a coat. You take me with you. Good. Madame pushes forward with enthusiasm, with *empressement*. You bow gracefully to the first burst. When the applause has somewhat modified, you draw back with becoming modesty and present me as the true hero, dragged there against my will. I shall enact my *rôle* to perfection. You, naturally embarrassed, will do the same. It will be superb. I see it all, *mon ami*, there is nothing in the world like the genius of initiative, that sympathy with events, that complicity with Fate which made Napoleon sublime. Adieu, I go to negotiate a loan of twenty-five francs, which will hire my costume. Curtain to rise at nine precisely. First appearance of Messieurs Bourgogne and —. *Au revoir*."

Before I could remonstrate, the wild fellow was gone.

The worst of it was, that I knew he would fulfil his threat, and that he would compel me to accede to his desires lest he should revenge himself by some more absurd freak of his mischievous genius; but I looked forward with dread to the evening, and determined, if possible, to slip off before his arrival.

But Jules was too clever for me, and arrived while I was tying my cravat, arrayed in a faultless evening-costume, which he had got of a *fournisseur*, with immaculate kids and wonderful linen; and, before I could settle my mind, we were walking arm-in-arm up the narrow passage of No. 49.

The door was standing open, and a few people were chatting informally on the steps. The group opened to make way for us, and we were admitted directly to a small, square saloon, in which about a dozen people were assembled, in the centre of whom was Madame de Lisle, who instantly recognized me, and thanked me, in a few well-chosen words, for my opportune assistance.

Then it all fell out as Bourgogne had planned, except that, as I drew back to present my friend, to my amazement, Madame de Lisle extended both hands to him, and then presented her forehead, French fashion, for a salute, which Bourgogne, quite unmoved, deposited there.

"What, is it thou, Jules?" she cried, with the familiarity of an old acquaintance. "And what possessed thee to have thyself presented to me?"

"My fair cousin," said Bourgogne, "though I was too busy with the blouses yesterday to remark more than that the equipage was well appointed and the lady beautiful, something in the face haunted me, and, putting the name with the features, I had a shrewd fancy that I might find a friend; but, not being sure of any thing but my own audacity, I did not tell Mr. —, who brought me here most unwillingly to-night."

"I have not seen this madcap cousin for seven years," said our hostess, turning to me; "but I see he can remember a face as well as I. To-morrow you must come to me again, when I shall be at liberty. Now, let me present you both to my friends."

The circle to which we were introduced numbered certain names of note curiously mingled; members of the "Left" were conversing amicably with dowagers of the Faubourg St.-Germain, while one or two titles of the empire were making themselves comfortable with the coffee-and-cakes of the hostess.

There was no political conversation, but the tone of discourse was that of the gracious *causerie* which Madame Récamier declared to be among the lost arts of the Parisians, but which lingers still in certain circles, where the wit and grace of the women, and the subtlety and address of the men, would not have disgraced the saloons of the Hôtel Rambouillet.

"It is strange," I said, thinking I was addressing Bourgogne, "to see that the nobles of *la vieille roche* should look so much like other people. One imagines a Rohan or a De Coucy with a certain presence and dignity to distinguish him from the herd."

"Monsieur," said a playful voice, startling me from my half-reverie, "have you yet to learn that a Rohan or a Montmorenci is but another name for an imbecile."

"M. de Freslincourt can afford to say such things better than a younger noble," said Madame de Lisle, who had approached, "since his own blood is of the purest.—Mr. —, come away; I wish to present you to a charming old lady who will confound you by speaking of the Place de la Concorde as the Place Louis Quinze, and who knows no empire, and believes in his sacred majesty Henri V."

The old dowager was delightful, a perfect fossil of the best type; and then I found a senator, who detailed some of the exciting scenes at the late *séances* of that august body; and so, alternating, I passed a very agreeable evening, until at length I found myself beside Bourgogne taking leave of Madame de Lisle.

"Who, then, is she?" I demanded, as we walked down the alley, "this cousin, whom you embrace after seven years' absence—what invention is this?"

"My dear fellow," answered my friend, "'truth is stranger than fiction.' She is a cousin by marriage. Her father is a Berliner of note; her mother was a countrywoman of yours. De Lisle, poor fellow, was shot in Mexico. He was of good blood, had connections with the Faubourg St.-Germain; his wife, you see, has cemented them. She has a taste for politics, and dabbles in literature, is rich, and a widow. What more can she desire? I saw her at my father's, seven years ago. I was but a lad then, and faith I had forgotten her existence in the excitements of living. It is quite worth while to discover a cousin who has such Lafitte and Château Margot as this lovely being. I shall devote myself to her henceforth."

"But what has she to do with all these politicians?" I asked.

"That passes me," replied my friend. "Perhaps it was for the Lafitte that Jean de Roux and Garnier Pages were there to-night. There is some scheme afoot, you may depend. I am to go to her to-morrow informally, and take you with me. Keep your eyes open, my boy! we are needed for something, be sure."

But the friendly and cordial character of the morrow's visit was calculated to disarm the strongest suspicion, and very soon the villa became my favorite lounging-place, madame being always affable, and treating Jules and myself very like two young school-boys, whom she liked to have about. After a while, she began to make me useful.

"Jules had gone, and she had forgotten something; would Mr. — think it too much trouble to do a little commission for her, take a note, which she was afraid to trust to the mail or to a servant?" Of course, I was too glad to do any thing, and, in return, had a corner of the carriage for a drive to the Bois, and an *entrée* to madame's opera-box.

The streets were a good deal disturbed with soldiery and artillery, and the general commotions of the war, and it was not very pleasant for a lady to venture abroad. So, as Jules was training and drilling with the Garde Mobile, it became quite my habit to execute madame's commissions for her. I can't tell, now, of all the queer places I went to, nor the strange people I met on these errands; but there was so much to think of, and every thing was so full of interest, and we were all so occupied with the war, that nothing made much impression of itself; life, from day to day, being a shifting kaleidoscope of dramatic scenes; and madame always explained her affairs as resulting from an unpleasant complication about property with her husband's relations, in which I could serve her better than Jules, who

might get into a family difficulty if he had the handling of so delicate a matter. Then she would call me sagacious and secret, and, of course, I held my tongue.

Things were at this point, when Bourgogne appeared one morning in the uniform of a captain of the Garde Mobile.

"I am ordered on duty," he said, gravely, "in the Department of the Seine-et-Marne. I saw an old comrade of mine this morning, who was wounded at Weissenburg. I begin to fear that matters are going wrong yonder. The emperor manages too much, and has a lot of addle-heads about him. If we are in for a long war, and you think you had better go home, you will do what you can for my cousin, I am sure; but, of course, Paris will be in no danger. Adieu, good friend—" and, sobered for once, Jules marched off, whistling "*La Marseillaise*," and under my window I heard him singing, as he marched along:

"En avant, marchons!
Contre leurs canons;
Courons au feu,
Au feu des bataillons."

In the afternoon I went, as usual, to pay my respects to Madame de Lisle. I found her rather pale and dejected, reading the edict of banishment of Germans from the soil of France.

"It will bring much trouble upon the poor people," she lamented; and on this subject her thoughts remained fixed, till at length, apologizing to me for her abstraction, she seated herself at her writing-table, and scratched a few lines, which she begged me to carry to No. 7, Rue de l'Oratoire, where I could deliver them to M. Hassler, her German professor.

I promptly hastened on this errand, but, on the staircase of No. 7, I encountered a gendarme, who arrested my course and demanded my business.

I told him whom I sought, and his brow contracted.

"Hassler is under arrest."

"On what charge?" I asked.

"As an agent of the Prussian Government—a spy."

I was in consternation, and saw the necessity of caution, so I turned to leave the house without further parley, when my passage was barred by the bayonet of the guard.

"You wished to see Hassler?"

"Yes."

"What do you want of him?"

I hesitated. I saw that a bold tone would only lead me into difficulties, so I smiled gayly, though in much inward trepidation, and said:

"Don't be curious, mon brave; only a message from a lady."

The suspicious face did not relax.

"You are no Frenchman, I can tell by your tongue; possibly you, too, are a spy."

"My friend," I said, in most conciliatory tones, "you mistake me altogether; I have no sympathy with the Germans; I am the friend of France, though not a native. I am an American."

The stern features softened a little; then contracted again.

"Prove it," he said, severely.

Opportunistly I remembered that in my wallet was a tiny flag, placed there by loving hands before I left home, and, plunging into the depths of my pocket, I fished up the treasure, and displayed the silken stars and stripes.

"That is my best proof," I said.

The soldier smiled grimly, and raised his bayonet.

"We do not fight that flag," he said. "Pass on! but beware to whom you carry ladies' messages in these times."

I sped back to No. 49, and burst in upon Madame de Lisle with my intelligence.

"My note," she said, anxiously; "where is it?"

I searched my pockets—it was gone! In vain I poured out their contents upon the floor, and turned those unfortunate receptacles inside out; it was nowhere to be found. In pulling out my pocket-book, I had probably drawn it out unawares, and it had by this time fallen into hostile hands.

"I trust there was nothing of a political nature in your note to your professor, madame," I said, carelessly, little thinking of the signification of my words; but I was thunderstruck at the effect they produced.

Madame de Lisle looked at me with a face blanched to the color

of her handkerchief, but with the same steady, unflinching gaze with which she had studied me at our first interview.

"Mr. —," she said, "I have never been deceived in my judgment of a man. I know that you are trustworthy and resolute. Will you help me in this emergency, which demands promptitude and courage? I am obliged to leave this house instantly, without a moment's delay. I must go to England to-morrow; in the mean time, I must go to an hotel as a newly-arrived traveller, and under an assumed name. My safety depends upon your readiness and discretion. Will you help me? Do not fear that my heart will fail. I will sustain you in any invention that you may find necessary."

I could well believe her. Her paleness had given place to a brilliant flush, unusual to her white cheek; her eyes glowed with a calm and steadfast lustre. Inscrutable and unflinching she looked. She volunteered no information, and I asked no questions. The adventure pleased me. I consented to any course she chose to indicate.

She paused a moment for reflection, conceived a plan, matured it, and then announced her intention.

"I shall add a wrinkle or two to my face," she said, "and adopt a more antique costume. You will be a nephew escorting a beloved aunt to England. I shall speak no French, so that my accent will not betray me. You will do all the talking, and retain your personality and passport. Wait for me ten minutes."

She left the room, and I was musing upon the strangeness of my situation, when I heard a step upon the gravel, and a slow foot ascending the front stairs, and directly without announcement, the door was pushed open, and a shrill voice demanded of me in English whether "Mrs. de Lisle lived here."

The voice issued from beneath one of those ugly washbowl-hats, peculiar to the British female of middle age, upon the Continent; her dress was plain black; but a shawl, of gorgeous pattern, hung upon rather than draped the figure; and the costume was completed by a gigantic handbag and an umbrella. The eyes were shaded by a pair of blue spectacles, and, from the lines of the face, and the odd, cracked voice, I judged the speaker to be about fifty years old.

"Madame is not visible, I fear," I said, rising civilly. "I am her man of business, and have just been informed that she is very much indisposed."

"Young man," said the terrible being, solemnly, "you are imposing upon me. Mrs. de Lisle is my near connection, and see her I must. Your trifling excuse will not weigh with me."

I passed out into the hall with the intention of intercepting the *femme de chambre*, in order that she might warn her mistress; but a merry laugh behind me made me turn my head, and there I found Madame de Lisle smiling at me under the washbowl-hat, with the blue spectacles in her hand.

"Congratulate me on my disguise," she said, "since it deceived you so thoroughly. Thank you for your ingenious defence of my privacy."

"But the voice," I stammered in amazement; "where does it come from?"

"I have played comedy before," she replied, smiling. "I draw in my cheeks—so—and have an old woman's exit at command. But come, we must be off. We will make our exit through the garden, which will lead us into the Rue Marbœuf, where you can call a *fiacre*."

We passed under the trees, and down a long avenue which I had never discovered, behind some sheltering vines, and came out upon a narrow street, where I soon found a cab into which I put "my aunt" with proper attention—carpet-bag and all—and drove to the Hôtel du Louvre.

Having engaged rooms for my charge for the night, I returned to my own lodgings, to collect my thoughts, and a few traps.

I was very sure that my handsome friend had been dabbling in matters too deep for her; but, whether her difficulties were financial or political, I felt a desire to help her through with them, and determined to see her safely out of France, before I relinquished my right of protection. The novelty of the adventure interested me, and I emulated the pluck and energy of my companion, and her undaunted bearing in the presence of danger.

In the morning we took the first train for Boulogne, delaying our arrival at the Embarcadère du Nord till the very latest moment. We were just in time to enter the waiting-room, before the door closed with the order of the guard—"On n'entre plus. The train arrives;

Messieurs et dames, take your places, if you please." There was a great crowd, for everybody was hurrying away from Paris even then, and there was some little delay in getting out of the station, when, looking back through the window into the court, I saw a *fiacre* driving furiously in at the gate, with a cocked hat and epaulets half out the window, whose owner was urging the coachman to a furious speed. It was my acquaintance of the Rue de l'Oratoire!

A cold chill ran over me at the sight. The *gendarme* sprang from the cab and tried the door; it was barred. The guard was on the platform trying to settle the crowd in the various carriages, and the officer of police rattled in vain. A moment more and we were in our places, and the train moved off.

I leaned out of the window and heard a *gamin* singing, mockingly:

"Dans une gendarmerie.
Quand un gendarme rit,
Tous les gendarmes rient,
Dane la gendarmerie—"

and I drew a long breath of relief.

"Touch and go!" I remarked in a low tone to my companion, who had seen the whole thing.

"We must get out at Creil," she said, after a moment's thought. "They will telegraph to arrest me at Boulogne; but we will change our course, and evade them by taking the afternoon train. They will not know we are aware of pursuit, and so will not look for us near home, as they will learn that we have taken through-tickets to England, at the bureau."

We descended, accordingly, at Creil, and were wending our way from the station as much like ordinary travellers as possible, when a hand was laid upon my arm.

"In the name of the law," said a voice, in French, "monsieur et madame will do me the favor to come with me."

"Why, and whither?" I demanded, with proper astonishment and indignation. "You are probably unaware, sir, that I am an American citizen, and not subject to your laws."

"The excuse will not serve you again," said the very civil but peremptory myrmidon of imperial power. "A telegram has just been received at our bureau of police, stating that Madame de Lisle and a companion, calling himself an American, were in the train, with a description of the gentleman, which corresponds with your appearance, monsieur, though the lady seems disguised. You have through-tickets for London *via* Boulogne, and you leave the train at Creil. Suspicious circumstance, clumsy device."

"And on what charge, sir, do you arrest peaceable citizens of a foreign power on their travels, may I ask? and what proof do you possess?"

"The companion of Madame de Lisle in her flight cannot be other than an accomplice in her designs. The eye of the police has been upon you, monsieur; you have been frequently seen entering the house No. 84 Rue Jacob, a notorious haunt of the friends of Germany. You have deposited letters at the Prussian legation. You are known to be a constant visitor at No. 49, Avenue Montaigne, the home of a lady whom you are now aiding to escape, in disguise, from the penalties she merits. Pardon, monsieur, you are my prisoner."

"And what charge do you bring against this lady?" I demanded. "Why is she not at liberty to leave the country when and in what manner she pleases?"

"The charge, monsieur, is that of complicity with the enemies of France in procuring information for military purposes. You are not ignorant that Madame de Lisle is a *Prussian spy*!"

Again, I felt a chill creeping over me. Madame put a brave face upon it; but it was of no use. We were marched off to the bureau of police, and deposited in a narrow room, with a sanded floor, and no furniture but two rush-bottomed chairs and a deal table, the only ornament of the walls being an *affiche* containing the rules of the office.

"It is a mistake, of course," said Madame de Lisle, as soon as we were alone; "but we are in great danger. The temper of the people is such that any suspicion is as bad as reality for us. When the officer returns, I will talk to him."

That functionary appeared very quickly, and my companion discoursed to him with such presence of mind, and lied so adroitly, and maintained so strongly that she was the elderly Englishwoman she purported to be, that the officer was a little staggered; and I am not

sure but we should have got off, had it not been for the untimely arrival of a baggage-train, from which leaped my gendarme, who rushed to the station where we were.

"En voilà un!" he cried; "we have earthed them at last. Ah, mon garçon! you will bring no more *billets-doux* from fine ladies—eh?"

The case was hopeless. The indefatigable police had been on our track from the moment I had left the Rue de l'Oratoire. We had evaded them by the skilfully-planned move from the Avenue Montaigne; but they had recovered the scent just too late to arrest us before we quitted the city.

The accusation was clearly defined. Madame de Lisle was shown to have been in constant correspondence with Prussian officers of high rank. It was known that her connections in Paris gave her the *entrée* to circles of distinction, where all sorts of political knowledge was to be obtained, and that she had disposed of the same to the best advantage. Suspicions had been entertained for some time concerning her correspondence, and the note to M. Hassler contained proofs of her complicity in his own well-recognized movements for the spying out of the hostile city.

All this fell upon me with the force and certainty of truth, accompanied by the consciousness that I had made an egregious ass of myself in allowing madame to make a cat's-paw of me where an American would necessarily be above suspicion. I was justly indignant.

But any asseveration of innocence on my part would be useless, of course, and I did not feel like backing out, angry as I was, and I even still entertained a hope of being able to render some service to my fascinating and adroit friend; but, if the worst came to the worst—well, a man could but die once, and what did it matter? But, of course, I expected to get out of it somehow.

I had no chance of communicating these sentiments to madame, but she seemed to read them in my face, and, removing her blue spectacles, now that their concealment was useless, she shot upon me a glance at once so deprecating and so confiding that I forgave her all the mischief she had done, with that weakness that we all suffer from where a pretty woman is concerned.

After some hours' detention under strict surveillance, it was decided to send us back to Paris in the charge of a squad of the Garde Mobile that were just on their way from the provinces to Paris, and directly we heard the tramp of the soldiers outside, and the clear voice of an officer calling, "Halt!"

Something sounded familiar in the ringing tone; the door opened, and who should enter but Bourgogne!

I was very near bursting forth with an exclamation that would have ruined every thing, but was deterred in time by a quick motion of Madame de Lisle, which telegraphed to me and to Bourgogne a hint of silence that my friend of the Quartier Latin was far too practised a hand not to recognize, and which helped him to receive the instructions of the police with an unflinching steadiness of demeanor.

"You will conduct this lady and gentleman," said the *chef*, always civil, "to the bureau of the second *arrondissement*, and signify to the officer in charge that M. Jouffroy will report upon the case."

"Bien, monsieur."

"You will see that they are carefully guarded, and that no communication is allowed between them."

"Bien, monsieur."

"And you will use every precaution to prevent their escape."

"Assuredly, monsieur."

With this final caution, we were delivered over in form, and marched in the centre of the company to the railway-station, which was only a few rods off.

There Bourgogne drew me aside, and demanded of me, sternly, what the devil I was doing in that *galère*?

I gave him a succinct account of my endeavors to do my duty by his cousin, and detailed our adventures.

He mused solemnly. It was astonishing to see Jules solemn. The result of his meditation was a savage outburst against women in general, and a declaration that he was at his wits' end.

"Go and see madame," I said, "and she will help you."

She was safely locked in the ladies'-room all the time. Jules hesitated, then followed my advice. He returned in a few moments with a time-table, which he studied intently, addressing no remarks to me, except a few orders which he gave in his tone of military command, for effect upon the men.

At last the train arrived. There seemed to be a hopeless confusion about getting the troop into their places in the carriages. Bourgogne ordered them hither and thither, with a want of system that gave me a melancholy idea of his capacities as a commander. The guards swore; the soldiers looked sullen; Bourgogne flew about, complicating matters terribly. The train was fifteen minutes behind time, and the officials were growing furious. I sat in one of the compartments with Madame de Lisle, who watched the confusion calmly.

The bustle augmented. The out express-train came tearing into the station on the other track, and drew up beside us. Our windows looked directly into those of an empty compartment of the first class. The doors of the two carriages were opposite, and the space between the tracks was wide enough to allow them to open.

Madame de Lisle pulled down the curtain on the station side of our car, put her hand out of the other window, turned the lock, which I found had purposely been left unbolted, and stepped into the vacant space between the two trains. Luckily, the carriage opposite was also unbolted. We stepped in, and madame drew down the curtains to conceal us. In another moment the train started, and we were off.

"Jules forgot to mention that I was a prisoner," she said, smiling, "and the stupid woman at the station gave me two tickets for Ostend. I think, too, he will forget to look for us until his train is off, being so busy with his troop. So we are safe."

We took the boat, that night, from Ostend to Dover; but not till I had deposited Madame de Lisle at the Grosvenor, and taken my own rooms at the Langham Hotel, did I breathe freely once more. My first act was to write to Bourgogne.

By return of post I had a letter from him which relieved my anxieties. He had received a severe reprimand for carelessness, but otherwise had not suffered from our escape—the confusion in the Bureau de la Guerre, arising from the intelligence just received of the disaster of Wörth, being too great to admit of minor matters receiving much attention. He was ordered with his troop to the Department of the Moselle, and would set forth the following day. My trunk and papers he would gladly forward to me, but unfortunately they were in the possession of the police, and any application must be made through the American minister.

He bade me farewell with effusion, and sent his respectful homages to his cousin.

I did not deliver them. I must confess that I did not go near Madame de Lisle again, being heartily sick of the whole business. The Russia sailed, the following week, for New York, and I took passage in her, hardly feeling safe, indeed, until I found the Atlantic between myself and the police of Paris.

SIDNEY HYDE.

CHINESE GAMBLERS.

THE passion for gambling, common among most barbarous or semi-civilized peoples, is particularly strong in the Chinese. It pervades all classes of society. From the *gamin* in the street to the fine lady in her boudoir, from the outcast in the opium-den to the priest in the temple of Buddha, few are exempt from the prevailing mania. Though the practice of gambling, and the manufacture of gaming-implements, such as cards, dice, dominoes, etc., are forbidden by law, nowhere are these operations carried on more openly than in China. In some parts of the principal towns and cities, almost every house is a gambling-den. This violation of law is winked at by the subordinate officers of the government, who are bribed by keepers of gaming-hells. Even the high mandarins seldom take the trouble to ferret out and punish offenders. They connive at the practices which they condemn. Like our municipal authorities, they occasionally make a raid on some notorious establishments, and then their zeal goes to sleep again. Oftentimes they are themselves transgressors. The example of statesmen like Chesterfield and Fox might be paralleled among high officials of the Flowery Kingdom.

As the execution of the laws against gambling is evaded by the constituted authorities, inhabitants of towns and villages are sometimes obliged to form vigilance committees to detect and punish culprits. Huc, the French missionary, has given an interesting account of one of these organizations. A large village near his mission was notorious for its professional gamblers. The inhabitants were so demoralized by the nuisance that they hadn't the desire or the energy

to abate it. At last the chief of one of the prominent families, who was himself addicted to the vice, determined to put a stop to it in the village. He accordingly invited the principal inhabitants to a banquet. Before the close of the entertainment he made some earnest remarks on the evil effects of gambling, and urged the formation of an association for its suppression in the village. His proposal, which at first excited considerable opposition, was, after serious consideration, adopted. An organization was formed to seize all persons detected in gambling, and bring them before the tribunals for punishment, every member agreeing to assist in carrying out this plan. Warning was then given of the existence and purposes of the society. A few days afterward three gamblers, arrested with cards in their hands, were brought before a tribunal in the nearest town. Having been found guilty, they were severely beaten and heavily fined. These vigorous measures had the desired effect. Gambling was suppressed, and the success of the association led to the formation of others in neighboring places.

Organizations of this kind, however, are only of limited and temporary efficiency. The passion for gambling is so universal that it is impossible to root it out. In the great cities gaming-houses are numerous and flourishing. Provided with all the attractions that can please the senses, they stretch their nets far and wide to entrap the unwary. Their agents are always on the lookout for greenhorns from the country with money in their pockets. By tricks, not unlike those which are practised in Europe and America, the victim is led from one place to another to see the "sights," before being lured to the gambler's den. At first he ventures only a small sum, and is allowed to win. Encouraged by his good luck, and urged on by the congratulations of the confederates, he goes on from bad to worse until he loses all his own money and oftentimes that of his friends in the country, who have intrusted him with funds to purchase goods for them. The result of his misplaced confidence is, that he returns home penniless and disgraced, or, ashamed to go back and face his friends, he lingers about low haunts in the city, and at last becomes an adventurer and vagabond, a beggar, or a thief.

A great variety of games are used in these dens. Among them are chess, dominoes, draughts, dice, cards, and *tsai mei*, which resembles the Italian morra. Habitual gamblers, however, prefer cards and dice. Chess and draughts differ from the same games with us, the former having some pieces with uses like our knights and castles, while others have different powers from anything in the European and American game. The number of men in draughts or checkers is three hundred and sixty, half of them white, and half black. They represent the number of days in the year. The Chinese pack of cards contains many more than the American, but their dominoes are the same as ours.

The universality of the passion for gambling is shown in the streets. You will hear the clicking of dice at the stand where the huckster offers for sale fruit, candy, and other small wares. He is glad to give a customer the chance of losing the price of any article, or of getting it for nothing. The fascination of this glorious uncertainty to the saucer-eyed, pig-tailed China boy, is so great that he willingly risks the sum with which he could obtain some coveted dainty. A peculiar feature of these hazardous enticements is a kind of literary or poetical gambling. The operator, sitting behind a table at the street side, shows to passers-by a written line of poetry containing five or seven characters with one word omitted. On another piece of paper lying on the table are several other words. Either of them, if inserted in the vacant space, will complete the line and make good sense. Depositing a stake of *tsai*, or cash, as the current native coin is called, you guess which is the lucky word. If you make a mistake, you lose the money. If your surmise is correct, you win five times the amount. To prevent fraud, the right word is written on one side or corner of the paper containing the defective line. This part is then turned over until a wager is made, when it is shown to the customer to convince him that no deception has been practised.

The most common game among the populace of Canton, and also a favorite amusement of the Chinese in California, is called *fan tan*, or squaring cash. From a pile of coin lying on the table, the keeper takes one or two handfuls, and, placing them a little distance from the main heap, covers them with a bowl. The gambling consists in betting on the number of pieces left in the pile after it has been divided by four. A clerk notes the guess and stake of each person. As the keeper of the table picks out the coins four by four, an anxious crowd watches

his movements to see that no cheating takes place. Deception, however, is very difficult in this game, and can only be accomplished by an expert juggler.

Another kind of gambling is effected by means of three pieces of bamboo which the street performer holds in one hand. To the end of one of them a red string is professedly attached, and the lower part of it may be seen hanging below the hand of the proprietor, while the upper is concealed by his closed fingers. The problem to be determined is, to which of the three sticks the string is fastened. The person making a venture deposits the amount on one of the sticks. If this has the string at its end, he gets back his stake and twice as much more. If he makes a mistake in the selection, he merely loses the amount risked. In this game the proprietor seldom loses any thing. He generally contrives to fasten the string to all of the pieces of bamboo in such a way that he can slip it off from any of them without being perceived, and takes care not to let outsiders see how the trick is done.

A common mode of street gambling is that of the revolving pointer. A round board, about fifteen or eighteen inches in diameter, is divided, by lines passing from the centre to the circumference, into eight or sixteen equal parts. On a post or standard, eight or ten inches high, erected in the centre of the board, a horizontal piece of wood is placed so that it can swing about easily. To the end of this slender stick a string is fastened. Its lowest part, as it hangs down, nearly reaches the surface of the board. A place two or three inches long on the standard, above the revolving pointer, is used for the deposit of the gambler's stake. The Chinese copper coin, called cash, having a square hole in the middle, slides down the sharp end of this stick, where it remains till the chances of its ownership are determined. After placing his cash on the standard, and indicating the division which he bets upon, the gambler gives the horizontal stick a twirl. If, when it ceases moving, the string hangs over the division selected by the player, he receives eight or sixteen times the amount of his wager, according to the number of divisions on the board. Otherwise he loses only the sum deposited. But, if instead of betting upon a particular space, he bets on one of the dividing lines, and the string should hang directly over it, he wins twice as much as he would have gained in the first instance. The proprietor of the gambling instrument frequently has a supply of candy and sweetmeats, with which to settle his losses, in whole or in part, provided his customers are willing to accept such articles. If they decline to receive them, he is bound to hand over the cash.

While most forms of gambling are tolerated by the officers of the law in China, there is one which they persistently endeavor to suppress. This is a sort of lottery in which the profits of a successful wager are three hundred per cent. The feverish excitement produced by this species of gaming has resulted in so many excesses that the government punishes its abettors with pitiless severity. Not many years ago the conductor of one of these lotteries at Foochow was arrested and beheaded by order of the viceroy. To elude the vigilance of the authorities the managers usually hold the lottery in some secluded spot several miles from the city. There, among the woods and hills, they feel tolerably secure. If discovered, they trust to their knowledge of the ground to facilitate their escape. To make assurance doubly sure, spies are kept in the city to give warning of the designs of the mandarins, and pickets are placed in the vicinity of the rendezvous. Scouts are also stationed along the roads leading to the city to watch the movements of suspicious-looking parties, and give speedy information of approaching danger. In this lottery there are thirty-seven sets of names, only one of which is the winning one for a particular day. Whoever guesses this is entitled to three hundred per cent. profit on his investment—an arrangement in which the chances clearly favor the proprietors.

In the autumn great numbers of crickets are caught and sold in the streets for gambling purposes. Two of these insects are placed in a tub or basin, and irritated with a straw. This maddens them so that they rush at each other with great fury, each chirping as he makes the attack. Surprising pluck and endurance are shown by these creatures, and, as neither is willing to give in while he can crawl to the combat, death or mutilation generally befalls one or both of them. Contests between quails are also arranged for the same purpose. After being carefully trained, they are placed within a railing on a table, where millet has been strewed. If one ventures to pick up a kernel, the other attacks him vigorously with beak and claws, and the

struggle lasts till exhaustion drives the unsuccessful combatant to the protecting hand of his owner. A good deal of money is staked on these contests.

The excitement of gambling sometimes drives its votaries to frightful excesses. Men who have lost their money, houses, and lands, by this mania, will stake the clothes they have on, and even gamble for their wives. The statements of old writers in regard to the depth of the gamester's infatuation would be incredible were they not confirmed by later authorities. Arab travellers in China in the ninth century tell us that penniless and boastful persons among the lower classes sometimes play for their fingers. At the end of the game the winner places his opponent's hand on a stone, and with a sharp hatchet cuts off one of the fingers. The victim then dips the mutilated stump into a vase of nut or sesama-oil under which a fire has been kept burning during the game. This cauterizes the wound. Even this frightful mutilation does not prevent the gamblers from renewing their ghastly sport. To show their contempt of suffering they will sometimes pour oil on their arms and set fire to it, so that the odor of the consuming flesh is perceptible, yet the victim exhibits no sign of pain, and calmly goes on with his game.

The veracious French missionary, M. Huc, whose opportunities for observing Chinese manners and customs were peculiarly favorable, confirms from personal observation the existence of this usage. He resided several years in the north of China, where gamblers carry their excesses to a height seldom exhibited in other parts of the empire. In the most intense cold of winter he saw men running about in a state of complete nudity, or crouching against the chimneys which in that region extend along the walls of the houses on a level with the ground. These miserable creatures, trying to keep from freezing, were gamblers who had been driven from the gaming-houses, where they had lost every thing, even to their clothes. Their companions, hardened by a vice which more than any other fosters inhumanity, exulted in their sufferings, and after seeing them fall dead from cold would return to the gambling-house and play as if nothing had happened.

Such scenes as these were of course not universal, and would probably be seldom witnessed in places usually visited by Europeans. It is to be hoped that twenty-five years have made their recurrence impossible. Even now, however, the passion for play has its victims among all classes. At the beginning of the New Year the restrictions upon gambling are suspended for several days. Gaming-tables become unusually numerous in the streets, many of them being kept by mere children. Even the temples are sometimes profaned. Rows of gambling-stands within the sacred precincts and close to the idols, are surrounded by an excited crowd watching the falling dice. Even ministers of religion join in the fascinating sport. Rev. Justus Doolittle, one of the missionaries of the American board, saw some of the priests, in the great Lama monastery in Peking, clothed in ample breeches of a deep-red color, and red blankets thrown over their shoulders instead of a coat, gambling with large cash. They had just finished their afternoon worship at the shrine of Buddha, whose enormous bronze image, sixty feet high, and supposed to be the largest idol in the world, is in one of the temples connected with the monastery.

It is not strange that, with their superstitious belief, Chinese gamblers should have gods for their especial benefit. Indeed, these deities are devoutly worshipped. A favorite figure for one of them is a winged tiger standing on his hind-feet and grasping a large cash in his mouth or paws. Sometimes the image is made of wood or clay, or drawn on a piece of board or paper. The title of the beast, "His Excellency the Grasping Cash Tiger," is frequently written on a piece of paper and placed in the gambling-room between two bunches of mock-money suspended under a table, or on the wall behind it. This figure is often used as a sign for a gambling-house. "Fighting the tiger" is certainly desperate sport wherever pursued, and it is curious that we should have to look to China for the origin of the expression as applied to gambling. To gain the favor of this god, incense and candles are burned before his image or inscription, and on the second and sixteenth days of every month offerings of meat, fish, etc., are often laid before it. Keepers of gambling-houses worship the tiger to insure success.

Another god of gamblers, called *Tu Chieng Kùu*, aptly symbolizes the desperate condition of his devotees. According to the popular belief, he represents a man who became so infatuated with gambling

that he sacrificed all his time and money in its pursuit, and finally died of want. His image, called a "*devil gambling for cash*," is that of a person in tattered garments, with his cue curled around his head and a gambling-card stuck in his hair. Whenever a lottery is to be drawn this god is vigorously worshipped. Candles and incense are burned before him, lots are drawn with bamboo-slips, and in the ecstasy of their adoration his devotees kneel down and knock their heads against the ground. Some inveterate gamblers keep a small image of him in their houses, before which they pray for favoring dreams for gambling. To secure these, they light candles and incense, and then lie down to sleep before the image.

In order to obtain lucky numbers for one of the lotteries previously mentioned, the gambler sometimes places thirty-seven slips of bamboo marked with written characters before the image, covering each slip with a kind of shell. Before going to bed, candles and incense are burned. In the morning he examines the pieces of bamboo, to see if any have been moved during the night. If one has been stirred, however slightly, the movement is attributed to the god. It is thus that he intimates to his favored worshipper the lucky numbers in the lottery, one of these thirty-seven sets of characters being selected by the managers as fortunate characters for the drawing.

Among the Chinese in California gambling is extensively practised. Its evil influence upon their countrymen is deplored by the better classes in both hemispheres. The remedy for it in this country must be found in the education of the people and the enforcement of the laws.

ALEXANDER YOUNG.

THE GREAT METEOR OF 1860.

By HON. THOMAS L. CLINGMAN, OF NORTH CAROLINA.

ON the 2d of August, 1860, I was at Asheville, Buncombe County, in the picturesque mountain-region of North Carolina. On the evening of that day I retired to my room a little after ten o'clock. The moon was full and approaching the meridian, and the night was clear and bright. There was a window on the west side of the room covered by a white curtain. The candle having been extinguished, my attention was suddenly arrested by a bright glare of light. It was much brighter than a candle would have made, and seemed like a sheet of flame against the window. With surprise and alarm I went toward the window, but before I reached it the light suddenly changed its color and became beautifully white. The thought at once flashed upon me that it must be a meteor, and I saw its outline through the curtain as it exploded in the northwest. The light at the moment of explosion seemed as white as that produced by the burning of the metal magnesium. During the whole period that I observed the light it was greater than hundreds of moons would have caused.

On the next day, I made inquiries of many persons who had seen the meteor. It was observed by a large number, because the evening was that of the election-day, and also because there was a party of gentlemen then on horseback in the town to receive General Lane, whose coming was expected. They all concurred in saying that the meteor was first seen in the southeast, but at a point nearer to the south than the east, that it moved toward the northwest, and when due west of Asheville appeared to be at an elevation of forty or forty-five degrees, and that it seemed to explode in the northwest, with a great display of light. Most persons regarded it as appearing to be equal in size to the full moon, and all agreed in saying that the moonlight was nothing in comparison with its brightness. When first seen in the southeast it seemed of a dull or pale red color, and became brighter as it moved along until it resembled the sunlight.

Persons from the surrounding country made similar statements as to its appearance. Colonel C. M. Avery, who saw it while in Morganton, sixty miles to the east of Asheville, described it as not materially different in position and aspect; while persons in Franklin, seventy miles west of Asheville, spoke of it in similar terms, except that it seemed to them higher in the heavens to the west, and more nearly over them. In a few days the newspapers from Knoxville, Tennessee, and from Columbia, South Carolina, came to hand, with similar descriptions, representing the meteor as having passed on the west side of both of those places. When the *Raleigh Register* arrived from the east, it contained a very clear and minute description of it from the pen of Mr.

B. F. Moore, one of our most eminent lawyers. In a few days I saw descriptions of the meteor in two successive numbers of the *New York Herald*, of the dates of August 7th and 9th. These numbers contained extracts from newspapers, and also letters from various persons, at points widely distant, and covering a great extent of territory.

The most easterly notices were from Guiney Post-office, Caroline County, Virginia, and from Pittsburg, Pennsylvania; and the most westerly, from Montgomery, Alabama, Holly Springs, Mississippi, and Nashville, Tennessee. The telegraphic correspondents said next day that it had been seen simultaneously at New Orleans, Memphis, Cairo, etc.; and while, according to the statement of two of the papers at Nashville, it was seen to the east of that city, it appeared to pass on the west of Cincinnati, and several other places north and east of it in Ohio.

The course of the meteor would seem to have been along a track nearly over the State line between South Carolina and Georgia, then directly above the county of Habersham in the latter State, near the western extremity of North Carolina, very little to the east of Athens, Tennessee, but west of Knoxville and Cincinnati, and east of Nashville.

I will, in the first place, ask attention to the facts bearing on the subject of the height of the meteor while visible. Raleigh, North Carolina, and Holly Springs, Mississippi, are at least six hundred miles distant from each other. A few days after I read Mr. Moore's precise and elaborate statement, he and I went to the spot where he had stood at the time he saw the meteor. By means of certain trees and houses, he was able to indicate the line along which it had travelled. By taking the directions with the aid of a compass, it was shown that he observed the meteor when it was twenty-four degrees south of west, and that the point where it was last seen by him was also when it was twenty-four degrees north of west. He saw it continuously as it passed over these forty-eight degrees, but, Holly Springs being a little south of west only, he necessarily saw it at the time when it was in the direction of that place, and he estimated its height as being thirty degrees above the horizon.

From Holly Springs we have a carefully prepared and apparently very accurate statement from Mr. J. H. Ingraham, corroborated by the letters of several other gentlemen. From that place the meteor was first seen in the southeast, passed on the east side going northwestwardly, and disappeared in a direction west of north.

At its greatest elevation, and when east, it appeared to be thirty degrees above the horizon. It is clear, therefore, that Mr. Ingraham and the other gentlemen must have seen it when it was in the direction of Raleigh. Both observers, therefore, saw the object when it was directly between them, and each estimated it as being at an altitude of thirty degrees above the horizon. If it was equally distant from each of them, and I take it that such was very nearly the fact, it was above a point on the earth's surface not less than three hundred miles distant from them. To be seen at such an altitude, it must, therefore, have been not less than one hundred and fifty miles above the earth's surface. Even if it were only twenty degrees in height apparently, it would in its altitude be more than one hundred miles above the earth.

Mr. Samuel Schooler, principal of Edge Hill School, at Guiney Post-office, Caroline County, Virginia, was distant more than seven hundred miles from Holly Springs, and saw it first in the southwest, moving toward the north, and disappearing in the west, or over the State of Kentucky. He states its altitude as being apparently twenty degrees above the horizon. As he must have been four hundred and fifty miles distant from its path, his estimate would give a similar or even greater altitude to the meteor. Caroline County and New Orleans are fully nine hundred miles apart, and, if it passed midway between them, it might well have been seen by observers at both stations.

When all the statements published are considered, there would seem to be no reason to doubt but that this meteor, when distinctly seen between Raleigh and Holly Springs, was more than one hundred and less than two hundred miles above the earth's surface. If, therefore, the common opinion be true, that meteors are rendered visible only by passing through the earth's atmosphere, then that atmosphere must extend much more than one hundred miles from the earth's surface. This very meteor affords a strong proof of the correctness of this conclusion. It exhibited at first a pale or dull red color, became gradually brighter, till it attained a silvery whiteness, and then exploded with brilliant coruscations, and, as it moved on, repeated these

explosions several times. This would be accounted for on the supposition that a body originally cold was, on entering the atmosphere, heated by the friction caused by its rapid motion, at first becoming faintly luminous, and then growing brighter until its surface became so intensely heated as to generate gases, and thus cause explosions, throwing off fragments from its surface, and, as its successive coats became heated in like manner, repeating its explosions till it passed out of the earth's atmosphere, or was finally shattered to pieces.

When this meteor was first visible, it must have already passed for some distance through the earth's rarefied atmosphere, and have dipped deeply into it. It would therefore seem to be almost certain that the atmosphere must extend more than one hundred miles from the earth's surface, and probably much farther.

I will now advert briefly to the statements as to the size of the meteor. On this point the evidence is not so conclusive. Persons are liable to be deceived by the appearances of bright lights with respect to their real size. Mr. Moore says, when first seen, it appeared to be only six inches in diameter, but, when at the nearest point to him, he estimated it to appear thirty feet in diameter, and of some hundreds of yards in length. He lays much stress on the *solid* appearance of its light, it being well defined and without any irregular edges. Others say it looked like a railroad train, while some say it was as large as a barrel. Mr. Ingraham and others at Holly Springs say it was in size fully equal to the disk of the moon when full. A similar estimate was made by observers at Antioch College, Ohio, and at Pittsburg, Pennsylvania. If a body at the distance of three hundred miles should appear as large as the moon, it ought to be nearly three miles in diameter. As this meteor was throwing off luminous gases, it would of course appear larger than it really was, especially after it became intensely heated; but, when its color was dimmer than that of the moon, the deception ought not to be so considerable. It is also true that the observers generally say its brightness was greatest after it had passed and had receded from them.

The amount of light it gave also indicates its great size. Major Francis Logan, of Habersham, Georgia, and R. N. McEwen, then at Athens, Tennessee, nearly under its line of movement, represent it as being larger than the moon, white, "like melted silver," and throwing a light upon the earth "like that of the sun." And yet its brightness is described in terms almost as strong by persons at Holly Springs, more than three hundred miles distant. At Nashville and other points they speak of this light as sufficient to enable one to pick up a pin. Could any but a large body cast such a light over so great an extent of country?

But the most perplexing part of the subject is the rapid transmission of sound from this meteor. Colonel William M. McDowell (who was then and for several years previous making observations, for the Smithsonian Institution, at Asheville) stated to me the next morning, that, being on horseback and looking downward to the earth, which was already bright in the light of the full moon, he heard a rushing or hissing sound, and, on looking up, he observed the meteor in the southeast, presenting at first a dull-red color, and rapidly becoming brighter. Several other gentlemen in Asheville also declared that they heard such a sound distinctly, and at first supposed the meteor to be a rocket sent up. There were, however, ~~in~~ fact, no rockets at Asheville, nor was there any expectation that they were to be discharged.

Dr. J. F. E. Wordy (who has since the war been making the observations for the use of the Smithsonian Institution) was then in the piazza of Mr. Cheesboro's house, two miles southeast of Asheville, and declares that he not only saw but heard the meteor while it was in sight. Being somewhat deaf, he asked the members of the family if they heard it, and had an affirmative reply from all present. Colonel John A. Fagg, who had on that day been elected a member of the Legislature for Madison County, and who was then in the town of Marshall, twenty-one miles distant in a northwestwardly course, declared to me that he heard the hissing sound plainly while it was passing. Mr. J. H. Ingraham, writing from Holly Springs, says its passage was accompanied by a hissing sound, if the testimony of a great number of persons was to be relied on. Mr. W. C. Knapp, of the same place, says it was accompanied by a hissing noise. Mr. H. A. Preston, who writes from Antioch College, Yellow Springs, Ohio, says a faint hissing sound was distinctly heard.

Major Francis Logan, of Habersham, Georgia, says that persons there generally spoke of hearing it during its passage in the same

manner. Mr. R. N. McEwen, who was then at Athens, Tennessee, says that he and his wife, being in the piazza of his house, were both confident that they heard a hissing sound as it passed over them. Seeing its brilliant explosion after it had passed toward the northwest, thinking it only two or three miles distant, they remained standing for some time in expectation of hearing a report, but not until after they had gone into the house, and, as he supposed, an interval of fifteen minutes had elapsed, was there heard a prolonged sound, as the report of a large cannon.

A gentleman, who lived near Asheville, stated to me the day after the meteor had appeared, that, on seeing the explosion, he paused in the road for a little while, in expectation of hearing a report, but that he walked afterward nearly around his farm, and, after an interval, he thought of at least fifteen minutes, had elapsed, a heavy sound came from the direction of the meteor.

We have thus the statement of a number of intelligent and trustworthy persons who were separated hundreds of miles from each other, all affirming the same fact. But as sound is ordinarily estimated to travel but little more than eleven hundred feet in a second, the meteor might be supposed to have been out of sight of those nearest to it, for at least eight or ten minutes, before the sound created by its passage could have been heard. Were they all mistaken in supposing that they heard it while it was in sight?

Is the ear much more likely to be deceived than the eye? Are not persons generally as confident that they hear the thunder as that they see the lightning? Why should all these persons imagine that they heard such a sound when it is not usual for meteors when so seen to be also heard? Two of them did expect to hear the explosion, and waited for it without imagining that they heard it at the time when they expected it, and only heard it long after they had ceased to look for it.

It is but natural that we should hesitate to believe as true what is at variance with general experience and with what seems established in science. Solid bodies had often been seen to come down from the higher regions of the atmosphere, before scientific men accepted the fall of meteorites as an established fact. But the circumstances under which these sounds were manifested were peculiar, and are not necessarily to be assumed as contradicting our general experience. In this instance a large body was moving with very great rapidity through the atmosphere. We can only approximate in our estimate the speed with which this meteor moved. While some observers regarded it as being from six to ten seconds in sight, the longest estimate of its visibility is that of Mr. Ingraham, viz., twelve to fifteen seconds. He and others with him at Holly Springs saw it in the southeast, and until it had passed to the northwest. One writer says it disappeared west of north. It must therefore have been seen to move through a space to be measured by more than a hundred degrees, and it might have been much more. As the meteor, considering its elevation above a place on the earth's surface at least three hundred miles off, was at the nearest point farther from the observers than that distance, if it moved through one hundred degrees of space in a right line nearly, it must have been in view while it was passing through a distance of six or eight hundred miles. Such a calculation would make its speed from forty to sixty miles per second, depending of course upon the accuracy of the estimate of the time. It could not have been describing a curve around Holly Springs, because it was at the same time seen by the observers in Ohio, Pittsburg, Pennsylvania, and Caroline County, Virginia, in its course to the northwest. Mr. Moore, who was at Raleigh, on the opposite side of the meteor's track, and probably about the same distance from it, saw it pass through forty-eight degrees by measurement in eight seconds, as he estimated the time it was in view. Its speed, calculated from these data, would approximate fifty miles in a second. As it appeared to be moving in the part of its course seen by me, it seemed certainly not less rapid.

Might not a body moving with this velocity generate a rapid transmission of sound? If we assume that there is some highly-elastic medium through which light and electricity, for example, are propagated, might not this body, by the suddenness of the impulse it gave, propagate a sound to a great distance with such speed?

But it may be said that lightning moves with very great velocity, and that yet the noise of the thunder travels with only the speed of other sounds. It is true that, when the flash is near, the thunder seems louder to the ear than any other sound, and yet it is propagated to the distance of only twelve or fifteen miles. On the other

hand, though, when one is near a large cannon, its report does not seem so loud as thunder, yet it can be heard to a much greater distance. When, during the late war, I was at Charleston or Savannah, I could in favorable states of the atmosphere distinctly hear the guns at the other place, though the two cities are understood to be one hundred miles apart. The cannonades at Charleston were often heard in the upper portions of South Carolina, while those at Richmond, Virginia, were sometimes heard west of Greensboro, in North Carolina—in each case at a distance of nearly a hundred and fifty miles. Why is it, then, that, though thunder seems louder than the reports of artillery, it cannot be heard so far?

The explanation does not seem to be difficult. If a pistol be discharged into the water, the bullet breaks the surface violently, and causes the water to be sprinkled for a short distance; but the ripple produced on the surface extends but a few feet around. When, however, the steam-frigate *Minnesota* was launched at the Washington Navy-Yard, though she glided so gently into the water that she did not break the surface apparently, yet she caused a wave which extended itself across the harbor, and rose several feet on the shore opposite, wetting many persons who were there to see the launch. As an illustration on a still larger scale, I refer to the fact that earthquakes in Japan cause waves which are propagated across the Pacific Ocean to the shores of California. A large body, though moving slowly, creates a wave which extends to a great distance, while a violent impulse of a small one produces no such result.

From the smallness of the furrow produced by lightning through the bodies of trees struck by it, and from its passing so readily along a small rod, it would seem that the volume of air displaced by it is small, and analogous to the effect caused by a pistol-shot on the water; while the explosion of gunpowder, when a large cannon is discharged, produces a greater displacement of the atmosphere, causing a large wave of sound, which is extended to a great distance, as the wave in the water caused by the *Minnesota* was perceptible for miles.

But, when the ship was launched, though a larger portion of her bulk was in the air than in the water, yet she did not make a corresponding wave in the air which could be felt across the harbor. Even a railroad-train, moving much faster than did the *Minnesota*, does not send in advance of it a great wave in the air. But, in fact, air is capable of receiving such an impulse. When a large gun is discharged, such motion is given to the air that houses are shaken and window-glass broken. As air, therefore, is much rarer and more elastic than water, it seems that it requires a much more sudden impulse to create an extended wave in it than in water. If, then, it may be regarded as a general law that the greater the rarity and elasticity of a medium the more sudden and violent must be a force sufficient to produce a movement that will be extensive, then it might well be that the expansion of gases generated by the explosion of gunpowder would be too slow to affect a medium as much rarer than common air as that air is rarer than water. But a much more sudden and violent movement might possibly cause an impulse in such a medium that could be perceptible at a great distance.

A cannon-ball, propelled with the ordinary charge, is barely driven a mile in five seconds. If we take forty miles per second as the velocity of this meteor, it moved with a speed two hundred times greater than that of a cannon-shot. A spherical cast-iron shot weighs about two hundred and twenty-five pounds. If the meteor be assumed to have had a diameter of one mile, its surface, and the consequent volume of atmosphere displaced, would have been more than twenty-five million times greater than that of the cannon-ball. And, as its solid contents were in bulk more than five thousand times greater than this number indicates, the resistance of the atmosphere would be trifling in comparison with that to the cannon-shot. Even if the diameter of the meteor were but one hundred feet, its surface would have been ten thousand times greater, and its bulk one million times larger. Such a body, moving with a speed two hundred times faster, would present a condition of facts with which we are not at all familiar on the surface of the earth.

The hissing sound described reminds one somewhat of sounds occasionally heard when electricity is passing along imperfect or non-conducting substances.

If electricity be coextensive with the atmosphere, this meteor might have produced great accumulations and disturbances in it, and caused vibrations to great distances. That these should be very rapid would seem to be probable from the fact that the greater the rarity

of the several gases the higher the speed with which sound is propagated through them.

Mr. McEwen, at Athens, heard the hissing sound while the meteor was in sight; but fifteen minutes elapsed before the report from the explosion reached him. The explosion was doubtless caused by the intense heat at the surface of the meteor, which generated gases, the expansion of which threw off the outer coating of the body in fragments. These gases ought to be expected to expand with a force and speed equal to those caused by the explosion of gunpowder. This has not, I think, been estimated as quite equalling one mile per second.

Such a movement would, therefore, be slow, compared with the velocity of the meteor itself. Hence, while the hissing sound caused by the latter might move with the rapidity of electricity, that caused by the explosion would travel only with the speed of such sounds as we are familiar with, and would therefore reach a person one hundred and eighty miles distant in fifteen minutes.

"RED AS A ROSE IS SHE."

AS if all roses were red! Did the fair author not think of Carey's beautiful verses?—

"As erst in Eden's blissful bowers
Young Eve surveyed her countless flowers,
An opening rose of purest white
She marked with eye that beamed delight;
Its leaves she kissed, and straight it drew
From beauty's lips the vermell hue."

There can be no doubt that all roses were originally white, even if they did not, as Anacreon will have it, arise from the foam that hung in snow-white flakes on Aphrodite's beautiful limbs, as she came forth from the sea in transcendent beauty. When the gods beheld her, they dropped nectar from on high, and hence the sweet fragrance of roses; but, as they were jealous of their great charms, they refused them the immortality which the drink of the immortals gave to every other being, and hence the roses remained forever frail and short-lived children of this earth. Even the Persians, who claim that roses are the product of their land—the sole remnant of paradise—admit that they were white, till Bulbul, the nightingale, burning with irresistible love for a fair rose, pierced her bosom with a thorn, and her life's blood, as she expired on the fair couch, tinged the leaves of the matchless flower forever with bright carmine.

A flower so marvellous in form, color, and fragrance, won almost instinctively the love and the veneration of men; and Romans and Greeks alike thought no offering to their gods superior to a chaplet of roses. The lover saw in the red rose a fair emblem of his own feelings, and laid it secretly upon the altar of Venus; while the pure white of others made them a fit symbol of chaste virgins. Thus gods and mortals alike were crowned with the fragrant flowers, and to this day the bodies of departed friends are, all over Italy, covered with white roses, as they are borne in open biers to their last resting-places.

Nor need we wonder that a flower so specially favored by Nature should have been endowed by man's superstition with marvellous powers. All the ancient masters of medicine speak of it with great reverence. In China, to this day, a small bag filled with rose-leaves is a talisman to secure the bearer against demons, diseases, and ill-boding dreams; and the Siamese believe that the good genius of men was created under a rose-bush, while the evil genius sprang from the dark shade of a cypress. Now, rose-water is looked upon rather with contempt, and the genuine oil or attar of roses is so rare that in the East, where alone it can be obtained at all, it brings a ducat a drop.

Not only in antiquity, however, was the rose a symbol of sacred import. Christianity soon availed itself of the glamour that hung around the beautiful flower, and transferred it to saints and martyrs. St. Dorothy received from comforting angels a bunch of heavenly roses, and hence never appears without the fragrant flower; St. Louis showed the effect of his good works in a rose that sprang from his lips; and St. Rosa of Lima threw roses into the air, as a pious offering to God, whereupon they formed the shape of a cross, to indicate that the homage had been accepted.

The pope, to this day, consecrates on the Sunday called *Dominica in rosa*—the third Sunday before Easter—a golden rose, which he be-

stows as a special sign of favor upon a church or a crowned head. In 1856 the Empress Eugénie received this mark of approbation on the occasion of the christening of her son; and in 1867 Isabella of Spain was so honored, not because of her virtues, which shone by their absence, but as an acknowledgment of her liberal contributions to the support of Pio Nono.

In France roses were once so highly revered that only certain privileged classes were permitted to raise them in their gardens. In return, they were bound to present to the council of their town annually, on the Day of the Three Kings, three wreaths of roses, and on Ascension Day a whole basketful of roses, from which rose-water was made. The latter was then an indispensable seasoning for almost all delicate dishes, and even roast-meats were never eaten without a large quantity of the precious fluid. In Parliament, also, it became the duty of every secular peer who was cited before the august tribunal to present the members with a number of roses, and a special officer—*le rosier de la cour*—was appointed to receive and dispose of the costly offering. The little village near Paris from which the supply for this purpose was mainly drawn retains to this day the name of Fontenay-aux-Roses. Even the humblest artisan was by law bound to present his daughter on her wedding-day at least with a chaplet of roses, though he might not be able to make her any other present.

Where such ardent admiration clusters around a flower, it is hardly to be wondered at that there should have been as strong antipathies. Marie de Medici never could endure the sight or the smell of a rose, and hated them even in paintings. The Duc de Guise fainted when he saw a rose unexpectedly, and in another Frenchman the idiosyncrasy was so powerful that, when some roses had been secretly introduced into his bedroom, he died of the effect. Even the ancients mingled occasionally contempt with their veneration, as when they represented an utterly-exhausted man under the form of a beetle dying among roses, or when they stigmatized effeminacy by the story of Smindyrites, the epicurean, who was unable to sleep because of a crumpled rose-leaf on his couch.

Roses were prominent elements of Roman luxury and voluptuousness. The famous Verres travelled in a kind of palanquin, in which he lay stretched out on a mattress stuffed with rose-leaves; wreaths of roses crowned his head, and lay on his neck; and a net filled with fresh roses perfumed the vehicle. The room in which Nero gave his magnificent feasts was so constructed that the ceiling and the walls turned around the guests, representing by turns the different seasons, while enormous masses of roses fell upon his friends, to represent hail and rain. At an entertainment which Cleopatra gave in honor of Anthony, the floor was covered three feet deep with roses, over which nets had been spread to make walking possible. Not only the guests, however, were crowned with the beautiful flowers, but the servants also wore crowns and garlands in great profusion, and cups and beakers were nearly hid under masses of red and white roses. Helio-gabalus, with his classic cookery-motto, "There is no such broth as rarity," used roses in such enormous quantities that at one of his feasts the falling showers stifled several of his guests—a little mishap which he enjoyed hugely.

He would bathe only in wine drawn upon roses, and even the public bathing-establishments of the city of Rome were, by his orders, filled with wine, which had passed through gigantic filters of roses, and was thus strongly impregnated with their delicious perfume. This immense consumption led naturally to the establishment of countless rose-gardens all over Italy, till the fragrance became absolutely oppressive in the streets of Rome, and Martial could exclaim: "Send us corn, O Egyptians, and we will send you roses in return!"

It is strange that the frail flower which had thus become the very type of extravagance and effeminacy should at the same time have been the symbol of courage. According to Ælian, the old Gauls exchanged their helmets for wreaths of roses before marching to battle, in order to express their determination to conquer; and the Eleventh Legion, which had first scaled the walls of Carthage, received from the grateful commander, Scipio Africanus, permission ever after to wreath their shields with roses.

With all its charms and all its poetic associations, the rose became useful only in one single aspect. The ancients maintained that Cupid had presented it to Harpocrates, the God of Silence, as a bribe to prevent him from betraying the amours of his mother. Hence its frequent appearance, sculptured and painted, on the ceiling of banquet-rooms, to remind merry guests of the importance of being dis-

creet even in their cups; and hence also the familiar saying, "Under the rose." At a later period, the Church adopted the symbol, and placed it significantly over the door of confessionals.

Europe had early a great variety of roses, to which the Crusaders added some splendid varieties brought from the East—as the fragrant Damask rose, from Damascus, the largest and one of the sweetest of the whole family. The monks showed almost everywhere a special predilection for the flower, and among them especially the followers of St. Benedict, so that there was no convent of their order without its rose-garden. This led to its adaptation to churches and buildings of every kind, in which the rose henceforth played a prominent part; so that the masons, to this day, carry roses on St. John's Day, in memory of its former importance. It was a sad abuse of this pious reverence when the Rosicrucians afterward wore a St.-Andrew's cross with a rose surrounded by thorns, and the inscription, "*Cruz Christi corona Christianorum.*"

When Columbus landed on our shores, he found the rose here also in matchless beauty, and enjoying great reverence. The Incas loved to fill their gardens with countless varieties, and the sons of the sun in Peru appeared on great occasions with wreaths of roses on their heads. Of the native varieties, the Labrador rose, the Cherokee rose, and the Carolina rose, are quite renowned in the Old World also; and others are constantly discovered or produced; for roses are easily changed by artificial fructification, either through the agency of winds and insects, or the hand of a skilful gardener, so that botanists know at least three thousand varieties. France, however, claims among all countries the first rank in the art of producing the finest flowers and the most brilliant colors, and stands almost alone in the many forms under which roses are employed to reward virtue and celebrate public festivities. Even the rosary—the string of beads representing a number of Pater-nosters and Ave-Marias—was long claimed by the French as an invention of their own, but was more probably introduced by Dominicus de Guzman, the founder of the great order of Dominicans. It obtained its name from the odd custom of making the beads of pressed rose-leaves, which enter in like manner into calomel-pills, while the beads of Mohammedan rosaries consist generally of holy earth from Mecca or Medina.

Nor has the rose lost ground in modern times. The last Napoleon showed a special fondness for his roses at Fontainebleau, of which he knew every one—only the rose of Puebla, it is said, he allowed to die out! The empress shared this fancy, and hence it was that the Prince of Wales presented her, last year, in acknowledgment of her cordial hospitality, a magnificent basket of gold, which contained every known rose, from the black rose of Holland to the white rose of York.

The oldest of all rose-bushes is said to be one which is trained upon one side of the cathedral of Hildesheim, in Germany. The root is buried under the crypt, below the choir; the stem is a foot thick, and half a dozen branches nearly cover the eastern side of the church, bearing countless flowers in summer. Its age is unknown, but documents exist which prove that a Bishop Hezilo, nearly a thousand years ago, protected it by a stone roof, which is still extant.

The largest rose-bush is a white Banksia—so called after Lady Banks—in the Marine Garden at London, which was sent there, the first of its kind, in 1813, by Bonpland. Its numerous branches, some of which measure eighteen inches in circumference, cover an immense wall to a width of nearly sixty feet; and at times, in early spring, as many as fifty thousand flowers have been counted on this queen of all roses.

SCHELE DE VERE.

LOW LIVES WE LED OF CARE AND SIN.

LOW lives we led of care and sin,
Low lives with but one aim, to win
Our brown and bitter bread.
We dwelt beside a mountain's base,
And ever more its rugged face
Rose sphinx-like overhead.

We could not read a meaning there;
We only saw, high up in air,
A pile of rocks and trees.

We had not climbed the massive height;
Enough for us the small delight
To sit betimes at ease.

"What good?" we asked, "would come, to stand
Upon the wind-swept table-land,
And look on fields below?"
We sneered, content within the vale;
We had nor will nor wish to scale
The cliffs where cedars grow.

But haply on a cloudless day
A neighbor on his journey's way,
Saw, at the sunset hour,
The sun upon our mountain high
Rest like a golden butterfly
Upon an azure flower.

All thoughts at last perform some use;
The good or ill that they produce
Must soon or late befall.
When he returned, our neighbor said,
"There may be fertile lands o'erhead
Upon the mountain-wall."

At this we climbed the flinty crags,
And vines above us waved like flags
Of welcome o'er a town.
Past June-clad plains we wandered by,
And lakes in which the loving sky
Narcissus-like looked down.

The even grass beneath our feet
Was something greener and more sweet
Than that which grew below.
We breathed a purer, better air;
Our lives seemed wider and more fair,
And earth with love aglow.

O ye, long used to care and sin,
Look up! take heart! and strive to win
A nobler, higher ground!
Think not that Virtue sits alone,
Withdrawn, on frowning peaks of stone,
Where only thorns abound.

She rather has but quiet dells
Where, with her kin, in peace she dwells,
And round her all is fair;
While ever, in her pleasant meads,
The flowers of noble thoughts and deeds
Enrich the breathful air.

HENRY ABBEY

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

I.

KNOCKING AT THE GATE.

START not, gentle reader! We do not mean to unroll a gentleman who figured at the court of the Pharaohs and made his salaams to the Princess Potiphar, who was afterward carefully embalmed, swathed, and secreted in the pyramids—the entrances to which, as well, were sealed up—wherein he slept in peace for several thousand years, only finally to be "sold for balsams," as quaint old Dr. Thomas Browne expresses it. In other words, the Egyptian gentleman to whom the Roving American proposes presenting you is not a mummy, neither is he several thousand years old, nor even approximating the respectable longevity of Methusehah.

On the contrary, he is a living, breathing being, in baggy breeches—or otherwise—belonging to this our era, and differing from the European chiefly in the fact of having very opposite views and practices

in reference both to the present and future state, living and dying differently, and peopling his future heaven with houriis of the earth earthly, not with angels. Our Eastern gentleman also rejoices in plural wives—a system our fellow-citizens of Utah have naturalized in our Western wilds, with the tacit connivance, if not consent, of Congress. The “strong-minded woman,” who claims to be the equal of man in every thing—save the sad rite of shaving—has never yet become “an institution” in the East, where the sex are shorn of many of their privileges, apart from the political. Their social system prevents the possibility of such feminine apparitions as Mrs. Stanton and Miss Anthony in *shintyans*, or Turkish trousers, under the shadow of the pyramids, who, otherwise, might teach the modern Egyptian, as those ladies are teaching young America, “the error of his ways.”

Although the Egyptian gentleman must necessarily be a “citizen of African descent,” yet he is not a black man, nor does there grow on his oft-shaven skull that peculiar species of capillary covering which in the animal creation, as in the Scriptures, separates the sheep from the goats. In plainer language, the modern Egyptian gentleman, like the ancient, is not a negro, nor even what is more politely designated “a person of color.”

The ruling race in Egypt comes from the pure Caucasian stock. The Egyptian gentleman is a white man in blood and breed, as well as in physical conformation and structure of skull. He is the apex of the Egyptian social pyramid—the gentleman *par excellence*, a term defined by our American authority, Webster, to signify “a man who is well born, one above the condition of a yeoman,” to which he prudently adds: “In the United States the term is applied to men of education and good breeding, of every occupation.” The old poet very aptly asks:

“When Adam delved and Eve span,
Where was, then, the gentleman?”

The next stones which compose the pyramid are the rough granite blocks (as we may term them) of the coffee-colored Abyssinian and copper-colored fellah—the agricultural laborers who do the hand-work, as their white superiors do the brain-work, of those primitive communities, in which still lingers much of the old patriarchal system described in that Book of Books wherein we find the true picture of the past, as we do the unerring chart for the future.

Let the reader, then, accompany his roving compatriot on a visit to one of “the upper ten thousand” of Cairo, and see wherein the social life of that class differs, not only from our own, but from that of all Christendom as well. For, as God, in His wisdom, created no two species of the same genus of lower animals alike, so has He classified man, since there is not a greater difference in the appearance and attributes of the Newfoundland dog and toy-terrier than there is between the lordly Turk or high Egyptian and the crouching fellah and Nubian, who toil that he may reap. There are to be found to-day, in Egypt, not less than fifteen different races, constituting that mixed society, if society it can be called where each race occupies its own separate quarter, never mingling socially, or intermarrying with the other, and only coming in contact for purposes of profit—a Chinese wall of religion, caste, and personal prejudice, separating the one from the other. Although there is no outward division of caste, as in India, yet the lines of demarcation are almost as sharply drawn as though some positive law imposed them. The only difference is, that in Egypt it is possible for individuals to overleap those barriers, while in India it is not. But the exceptions, even in the former place, are only just numerous enough to establish the rule.

The fifteen different races in Egypt, which make its present population, are: the Turk, the Arab fellah, the Bedouin, the Persian, the Nubian, and Berberi—who are Moslems; the Copt, the Syrian, the Armenian, the Greek of Athens, the Greek rayah (Turkish subject), and the Abyssinian—who are Christians; foreign and native Israelites, and Europeans of every nationality.

Over all these varied nationalities, except the European and the Greek of Athens, the Egyptian Government is supreme. By a concession extorted by Christendom from the Sublime Porte, all Europeans and Americans in the East have the privilege of extraterritoriality—that is, in all matters affecting life, liberty, or property, are subject only to the authority of the representatives of their own government, the native government only claiming certain police rights with regard to them.

The highest aristocracy of the country is, or assumes to be, of

Turkish blood, and the court-language is Turkish, not Arabic—the latter, though far the richer and more copious of the two, being regarded as the language of the vulgar, it being the mother-tongue of the fellahs, or peasants, who constitute the great bulk of the Egyptian people.

The Turk of Egypt differs from the Turk of Constantinople in many things—in costume, in character, and in actual civilization; for Egypt is really the only part of the Ottoman Empire where the flowery promises of reform and progress have ripened into fruit. Besides the Turk, native or imported, there may be found, among the high officials of Egypt, its landed proprietors, or gentlemen; a favored few Armenian Christians, like Nubar Pacha, the premier of the past and present viceroys, and who is to Egypt what Reschid Pacha was to Turkey; a few Copts, also, whose native talent as accountants had given them position; and a select few of native Egyptians, who owe fortune and place either to their individual merits or to the whims of successive viceroys; for in the East promotion is more rapid, and more open to individual effort, than even under our democratic institutions—the Jeffersonian doctrine that “all men are created equal,” which we only preach, the Turk carries out in practice. The pipe-bearer of to-day may become the pacha of to-morrow, and will fill his new position with a gravity and dignity which seem a Moslem's birthright. But the Christian must have rare merit to rise. These classes, then, living at ease in the midst of much smoke and multitudinous pipes, constitute the gentlemen of Egypt.

Having thus prepared the visitor for his reception, by these hints at the threshold, the Roving American mounts him on an Arab steed, and sets off with him to pay a visit to an Egyptian pacha, whose palace is on the banks of the Nile, just outside the Boolak Gate, at Cairo. Unless some accident happens on the road, we shall reach this palace in good time to describe it and its inmates in a succeeding paper; until then—“*Salaam aleikoum!*” (“Peace be with you!”)

PICTURESQUE AMERICA.

WITH ILLUSTRATIONS BY HARRY FENN.

MOUNTAIN ISLAND.

THE view which our artist gives of this singular freak of Nature—the Mountain Island and Falls of the French Broad—is taken just above the falls. The mountain-range, for miles very near to the river, here presses immediately across it, and the stream, in forcing its way through, divides, leaving an island over a hundred feet in height, just on the verge of the falls. The stream is narrowed down to one-fourth its usual width. The falls are about forty-five feet high, and the road, which above runs almost in the river, below skirts a dark and solemn abyss.

A traveller, coming this route once in the stage from Asheville, had been all night wearied with the roar of the river. Here he found it ten times worse, but soon the noise greeted his ears no longer. In delight he exclaimed: “Well, that confounded river has knocked the bottom out, jumped through somewhere, thank Heaven! I guess we'll have peace now.” His efforts for slumber were disturbed no longer, as it is a singular fact that, excepting a faint ripple at the Warm Springs, the waters of the French Broad cease their troublings after the Mountain-Island leap. Many persons claim that all the water which passes Asheville does not pass the Warm Springs, but sinks in some whirlpool, and rises again below. This appearance may be due to a more rapid current.

The road at Mountain Island is a noted stand for deer. The mountains here being very steep on both sides, the road is the only means of passage for them when chased by the dogs from above or below. Stopping at the Warm Springs years ago with Dr. McDowell, the generous host who then lived there, we were invited to a deer-hunt in these wild hills. Stationed, with others, at the Mountain Island, we awaited patiently the coming deer; nor did we wait long. The baying dogs were heard nearer and nearer, till suddenly, from round the jutting rock, sprung into the road in our full view, not twenty yards off, a magnificent buck. Three double-barrels were as quickly levelled. “Hold,” said Dr. McDowell, “don't shoot; see what he'll do. Time enough.” The buck surveyed us calmly, turned his head to the rapidly-approaching dogs, seemed to listen a moment to the shouts of the driver, then looked again at us, threw his superb antlers back, seemed to stiffen every sinew, and made one desperate leap to span

PICTURESQUE AMERICA.—MOUNTAIN ISLAND, FRENCH BROAD RIVER, NORTH CAROLINA.

rible enchantress. It has introduced a new social habit in drinking. It has connected abstinence with the ceremonial of religion and the pleasures of social organizations. It has addressed the working-man—as, in fact, he often is—as a child, and saved him from his own habits, by a sworn abstinence. Thousands of men could never have freed themselves from this most tyrannical appetite, except by absolute refusal to touch. In fact, it may be said that no vice is ever abandoned by gradual steps. The only hope for any one under the control of any wrong indulgence, is in entire and immediate abandonment.

With those, too, who had not fallen under the sway of this appetite, especially if of the working-class, abstinence was the safest rule.

The "Temperance Reform" in this country, in Great Britain, and in Sweden, was one of the happiest events that ever occurred in the history of the working-classes. Its blessings will descend through many generations. But in its nature, it could not last. It was a tremendous reaction against the heavy and excessive drinking of fifty years since. It was a kind of noble asceticism. Like all asceticism, it could not continue as a permanent condition. Its power is now much spent. Wherever it can be introduced now among the laboring-classes, it should be; and we believe one of the especial services of the Irish Catholic clergy, at this day, to the world, is in supporting and encouraging this great reform.

All who study the lower classes are beginning, however, now to look for other remedies of the evil of intemperance.

It has become remarkably apparent, during the last few years, that one of the best modes of driving out low tastes in the masses is to introduce higher. It has been found that galleries and museums and parks are the most formidable rivals of the liquor-shops. The experience near the Sydenham Palace, in England, and other places of instructive and pleasant resort for the laboring-masses is, that drinking-saloons do not flourish in opposition. Wherever, in the evening, a laboring-man can saunter in a pleasant park, or, in company with his wife and family, look at interesting pictures, or sculpture, or objects of curiosity, he has not such a craving for alcoholic stimulus.

Even open-air drinking in a garden—as is so common on the Continent—is never so excessive as in an artificial-lighted room. Where, too, a working-man can, in a few steps, find a cheerful-lighted reading-room with society or papers, or where a club is easily open to him without drinking, it will also be found that he ceases to frequent the saloon, and almost loses his taste for strong drink.

Whatever elevates the taste of the laborer, or expands his mind, or innocently amuses him, or passes his time pleasantly without indulgence, or agreeably instructs, or provides him with virtuous associations, tends at once to guard him from habits of intoxication.

The Kensington Museum and Sydenham Palace, of London, the Cooper Union, the Central Park, and free reading-rooms, of New York, are all temperance-societies of the best kind. The great effort now is to bring this class of influences to bear on the habits of the laboring-people, and thus diminish intemperance.

It is a remarkable fact in this connection that, though eighty out of the hundred of our children in the Industrial Schools are the children of drunkards, not one of the thousands who have gone forth from them has been known to have fallen into intemperate habits. Under the elevating influences of the school, they imperceptibly grow out of the habits of their mothers and fathers, and never acquire the appetite.

Another matter, which is well worthy of the attention of reformers, is the possibility of introducing into those countries where "heavy drinking" prevails the taste for light wines and the habit of open-air drinking.

The passion for alcohol is a real one. On a broad scale it cannot be annihilated. Can we not satisfy it innocently?

In this country, for instance, light wines can be made to a vast extent, and finally be sold very cheaply. If the taste for them were formed, would it not expel the appetite for whiskey and brandy, or at least, in the coming generation, form a new habit?

There is, it is true, a peculiar intensity in the American temperament which makes the taking of concentrated stimulus natural to it. It will need some time for men accustomed to work up their nervous system to a white heat by repeated draughts of whiskey or brandy, to be content with weak wines. Perhaps the present generation never will be. But the laws of health and morality are so manifestly on the side of drinking light wines as compared with drinking

heavy liquors, that any effort at social improvement in this direction would have a fair chance of success. Even the slight change of habit involved in drinking leisurely at a table in the open air with women and children—after the German fashion—would be a great social reform over the hasty bar-drinking, while standing. The worst intoxication of this city is with the Irish and American bar-drinkers, not the German frequenters of gardens.

In regard to legislation, it seems to me that our recent New-York license laws were, with a few improvements, a very "happy medium" in law-making. The ground was tacitly taken, in that code, that it subverted the general interests of morality to keep one day free from riotous or public drinking, and allow the majority of the community to spend it in rest and worship; and, inasmuch as that day was one of especial temptation to the working-classes, they were to be treated to a certain degree like minors, and liquor was to be refused to them on that day.

Under this law also, minors and apprentices, on week-days, were forbidden to be supplied with intoxicating drinks, and the liquor-shops were closed at certain hours of the night. Very properly, also, these sellers of intoxicating beverages, making enormous profits, and costing the community immensely in the expenses of crime occasioned by their trade, were heavily taxed, and paid to the city over a million dollars annually in fees, licenses, and fines. The effects of the law were admirable, in the diminution of cases of arrest and crime on the Sunday, and the checking of the ravages of intoxication.

But it was always apparent to the writer that, with the peculiar constitution of the population of this city, it could not be sustained, unless concessions were made to the prejudices and habits of certain nationalities among our citizens. Our reformers, however, as a class, are exceedingly adverse to concessions; they look at questions of habits as absolute questions of right and wrong, and they will permit no half-way or medium ground. But legislation is always a matter of concession. We cannot make laws for human nature as it ought to be, but as it is. If we do not get the absolutely best law passed, we must content ourselves with the medium best.

If our temperance reformers had permitted a clause in the law, excepting the drinking in gardens, or of lager-beer, from the restrictions of the license law, we should not, indeed, have had so good a state of things as we had for a few years, under the old law, but we might have had it permanently.

Now, we have nearly lost all control over drinking, and the Sunday orgies and crimes will apparently renew themselves without check or restraint. If a reform in legislation claim too much, there is always a severe reaction possible, when the final effects will be worse than the evils sought to be corrected.

If a student of history were reviewing the gloomy list of the evils which have most cursed mankind, which have wasted households, stained the hand of man with his fellow's blood, sown quarrels and hatreds, broken women's hearts, and ruined children in their earliest years, bred poverty and crime, he would place next to the bloody name of War the black word—*INTERTEMPERANCE*.

No wonder that the best minds of modern times are considering most seriously the soundest means of checking it. If abstinence were the natural and only means, the noble soul would still say, in the words of Paul: "It is good neither to eat flesh, nor to drink wine, nor any thing whereby thy brother stumbleth."

But abstinence is not thoroughly natural; it has no chance of a universal acceptance; and experience shows that other and wider means must be employed. We must trust to the imperceptible and widely-extended influences of civilization, of higher tastes, and more refined amusements, on the masses. We must employ the powers of education, and, above all, the boundless force of Religion, to elevate the race above the tyranny of this tremendous appetite.

C. L. BRACE.

DECISIVE BATTLES OF HISTORY.

"So lang des Zeltenswebstuhls Arme weben,
So lang die Menschheit lebt von Pol zu Pol,
Bleibt Trauerspiel das ganze Völkerleben,
Und ach! ein Schwert sein ewiges Symbol."

THE world's history has thus far been little else than a history of great battles between the different peoples, and it is probable, much as we may regret it, that it will continue to be so in the future,

as it seems to be ordained that, in great things as well as in small, little is achieved in the way of real progress without fighting hard battles and making heavy sacrifices.

But great national struggles must necessarily have their crises. After two nations have long contended for supremacy, the one over the other, a decision is finally reached—a decision which, it is true, might have safely been predicted, but often comes so suddenly, and under such circumstances, that we are inclined to attribute it to the genius of an individual or to accident, as was recently the case with the *Paris Figaro*, in its great ignorance, in attributing the immense success of the German armies, in the present Franco-Germanic War, solely to the genius of General von Moltke.

That such crises, such turning-points, do not always appear at the end of a great tragedy, but frequently in the third or fourth act, is often not duly considered. It will, therefore, be interesting to present them as massive columns that support the temple of history, or as a range of lofty mountains, from the summits of which we can obtain a panoramic view of lands and peoples. And further, history in its details, by the aid of these momentous events, may be more easily fixed in the memory than by a systematic division into periods that are not limited by palpable and bloody land-marks. Such are the following:

The battle of Marathon, fought October 29, 490 B. C., between the Athenians, under Miltiades, and the Persians. It resulted in the complete discomfiture of the Asiatic barbarians, and in permanently establishing Hellenic civilization.

The battle in the harbor of Syracuse, September, 413 B. C., between the Athenians, under Demosthenes and Nikias, and the Syracusans. The Athenians, it is true, were victors in the battle, but, owing to their having exhausted their supplies, they were compelled to separate, and the division under Demosthenes was forced, after a few days, to surrender to Crinios, while the other, under Nikias, surrendered to Asinarus. The unfortunate Athenians were closely confined near Syracuse, and nearly all died of disease, while their leaders were tried and executed by their enemies. Thus the endeavor to subject Western Europe to the power and civilization of Greece failed.

The battle of Leuctra, in the year 371 B. C., between the Thebans, under Epaminondas, and the Spartans, under Cleombrotus II., who was killed in the battle. The latter lost the battle, and with it their sovereignty over Greece.

The battle of Charonea, in Boeotia, August 3, 338 B. C., between the Macedonians, led by King Philip, and the Greeks, particularly the Athenians, Thebans, and Corinthians. In spite of the sacrifice of the Theban Sacred Legion, whose destruction Philip himself is said to have deeply mourned, the battle resulted in a brilliant victory for the Macedonians, which proved to be the grave of Grecian liberty and the beginning of the Macedonian rule in Greece. It was also at Charonea that, in the year 86 B. C., Archelaus, of Macedon, and Mithridates the Great, of Pontus, were beaten by the Romans under Sylla, who then conquered Athens.

The battle of Arbela—the Arbile of to-day in Asiatic Turkey—in the year 331 B. C., between Alexander the Great and Darius. This was the beginning of Persia's downfall, and of the spread of Grecian civilization in Asia.

The battle of Metaurus, in Umbria, in the year 207 B. C., between the Carthaginians, led by Hasdrubal, who was killed, and the Romans, under the Consuls Livius Drusus and Claudius Nero. This battle of the second Punic War has not, it is true, the prominent place in history that Cannæ, or Zama, or even Trebbia, has. It was nevertheless here, and not at Cannæ or Zama, that the Romans and the Carthaginians fought their most important battle, that the ascendancy of the Carthaginians was destroyed, and Roman supremacy established. The defeat at Cannæ, great as it was, did not break the power of Rome, and, when the two rival races measured weapons the last time at Zama, Carthage was already exhausted, and only received the last stroke. At Metaurus, however, although neither Hannibal nor Scipio commanded, the turning-point was reached. Had the Romans lost this battle, the republic would have been exhausted, and the Carthaginians would have easily subjugated their opponents.

The battle of Teutoburg, on the 9th, 10th, and 11th of September, 9 B. C., between the Germans, led by Hermann, and the Romans, under Varus. It released Germany from the yoke of the already much weakened Roman dominion.

The battle in the Catalanian Fields, near Chalons, in the year 451 A. D., between five hundred thousand Goths and Romans, under the Roman General Aëtius, and seven hundred thousand Huns, led by Attila. The defeat of the latter resulted in permanently establishing the civilization of the West.

The battle of Tours, July 22, 732, between the Franks, under Charles Martel, and the Saracens, led by Abderrahman. It freed the Christian world from the increasing power of Mohammedanism.

The battle of Hastings, October 14, 1066, between William the Conqueror and King Harold, of England. It led to the union of the Roman and Germanic races in England, the immediate results of which Macaulay describes thus:

"The battle of Hastings and the events which followed it, not only placed a Duke of Normandy on the English throne, but gave up the whole population of England to the tyranny of the Norman race. The subjugation of a nation by a nation has seldom, even in Asia, been more complete. The country was portioned out among the captains of the invaders. Strong military institutions, closely connected with the institution of property, enabled the foreign conquerors to oppress the children of the soil. A cruel penal code, cruelly enforced, guarded the privileges and even the sports of the alien tyrants. Yet the subject race, though beaten down and trodden under foot, still made its sting felt. Some bold men, the favorite heroes of our oldest ballads, betook themselves to the woods, and there, in defiance of curfew laws and forest laws, waged a predatory war against the oppressors. Assassination was an event of daily occurrence—many Normans suddenly disappearing, leaving no trace. The corpses of many were found bearing the marks of violence. Death by torture was denounced against the murderers, and strict search was made for them, but generally in vain; for the whole nation was in conspiracy to screen them. It was at length thought necessary to lay a heavy fine on every hundred in which a person of French extraction was found slain; and this regulation was followed up by another regulation, providing that every person who was found slain should be supposed to be a Frenchman unless he were proved to be a Saxon. During the century and a half which followed the Conquest, there is, to speak strictly, no English history, for the Conqueror and his descendants to the fourth generation were not Englishmen. Most of them were born in France; they spent the greater part of their lives in France; their ordinary speech was French; almost every high office in their gift was filled by Frenchmen; every acquisition which they made on the Continent estranged them more and more from the population of the island. One of the ablest among them attempted to win the heart of his English subjects by espousing an English princess. But, by many of his barons, this marriage was regarded as a marriage between a white planter and a quadroon girl would be regarded in Virginia. Had the Plantagenets, as at one time seemed likely, succeeded in uniting all France under their government, it is probable that England would never have had an independent existence. Her princes, her lords, her prelates, would have been men differing in race and language from the artisans and tillers of the earth. The revenues of her great proprietors would have been spent in festivities and diversion on the banks of the Seine. The noble language of Milton and Burke would have remained a rustic dialect, without literature, a fixed grammar, or a fixed orthography, and would have been contemptuously abandoned to the use of boors. No man of English extraction would have risen to eminence except by becoming in speech and habits a Frenchman. England owes her escape from such calamities to an event which her historians have generally represented as disastrous. John was driven from Normandy. The Norman nobles were compelled to make their election between the island and the Continent. Shut up by the sea with the people whom they had hitherto oppressed and despised, they gradually came to regard England as their country, and the English as their countrymen. The two races, so long hostile, soon found that they had common interests and common enemies. Both were alike aggrieved by the tyranny of a bad king. Both were alike indignant at the favor shown by the court to the natives of Poitou and Aquitaine. The great-grandsons of those who had fought under William and the great-grandsons of those who had fought under Harold began to draw near to each other in friendship; and the first pledge of their reconciliation was the great charter, won by their united exertions and framed for their common benefit. Here commences the history of the English nation."

The battle of Orleans, May 8, 1229, between the English, under

the Earl of Salisbury, and the French, led by Joan of Arc. This victory for the French enabled them to drive the English from the Continent.

The destruction of the Armada, the powerful fleet of Philip II., of Spain, which was to have conquered England, in August, 1588. With the Armada, Spain lost her proud supremacy. The power of Philip was broken, and England's rule of the seas was established.

The battle of Blenheim, August 13, 1704, between the allied English, Dutch, and Austrians, under Marlborough and Prince Eugene, and the French and Bavarians under Tallard, Marsen, and the Elector of Bavaria. The victory of the former thwarted the designs of Louis XIV., who aimed at universal dominion.

The battle of Poltava, July 8, 1709, between the Russians, under Peter the Great, and the Swedes, under Charles XII. It established the influence of Russia.

The battle of Saratoga, October 13, 1777, between the American colonists, under Generals Gates, Arnold, and Putnam, and the English, under Burgoyne. The victory of the colonists led to their alliance with the French, and eventuated in their achieving their independence from the mother-country.

The battle of Valmy, September 20, 1792, between the French, under Marshal Kellermann, and the allied Austrians and Prussians. This memorable battle assured the triumph of the great French Revolution of 1789 and of its ideas. As is well known, the Provisional Government of the present French Republic, in its first proclamation to the people, cited the defeat, at that time, of the German armies by the republicans as an example for them to emulate. In the interim, however, the times, men, and things, have greatly changed. Both the French and Germans differ widely from the French and the Germans of 1792; they have, besides, exchanged rôles. While Napoleon III. began the present war with unparalleled levity, the Prussians and Austrians, in 1792, were so foolish as to espouse the cause of French royalty, and to treat the affairs of others as though they were their own. On the 20th of April, 1792, the republic declared war against the "hordes of slaves," against the "allied kings." Three months later, on the 25th of July, the German proclamation was issued. It was full of exaggeration of their power, and of insults to the young republic. In vain the unfortunate King of France entreated the allies not to meddle with his affairs, as they would only expose him to new dangers, instead of rendering him any substantial aid, as they hoped to do. The condition of the French for carrying on a war, it is true, was wretched; but that of the allies was not much better. In France, however, there was union and no want of enthusiasm; in Germany, on the contrary, there existed a spirit of disunion and jealousy. The war had no sooner begun, than the leaders, on both sides, discovered that they had to fight their battles with unschooled, half-armed soldiers, and that they were not only poorly supplied with money, but also with provisions. Nevertheless, the allies invaded France, in the neighborhood, indeed, where the recent battles have been fought. On the 2d of August a corps of Austrians, under Prince Hohenlohe, advanced from Mannheim, meeting some little opposition on the part of the French near Landau. On the 22d, they reached Merzig, crossed the Moselle, besieged Thionville, and covered the left wing of the main army. In the mean time, Clairfait advanced from the Netherlands with fifteen thousand Austrians, and, on the 16th, united with the Prussians at Arlon. On the 20th they besieged Longwy, which surrendered on the 23d with its garrison of twenty-six hundred men. The French now redoubled their efforts to repel the invaders. Some ten miles from Verdun are the passes of the forest of Argonne. They were guarded by the army of Kellermann and Dumouriez. The condition of their forces was absolutely wretched, half-armed, unorganized, and poorly fed and clad. They numbered about sixty thousand. If the Duke of Brunswick had been expeditious in possessing himself of the heights between Verdun and Ménéhoult, the republicans would have been lost. But the duke hesitated, and the enemy, without opposition, on the 4th of September, intrenched themselves in the pass of Grandpré, and, on the 5th, in that of Islettes. The allied Austrians and Prussians succeeded, it is true, in driving the republicans out of Grandpré on the 14th; but they failed to pursue the retreating enemy. Although the Germans numbered only forty thousand, they should have proved more than a match for the French, on account of their greater experience and better organization. It was not until the republicans had united all their forces on the heights of Valmy, that a pitched battle was fought. The German artillery was, even then, so

admirably served, that it threw the republican ranks into general confusion. A bayonet-charge would have decided the day in favor of the allies; but, owing to a difference of opinion on the part of the German leaders, it was not made, and consequently the battle remained undecided. The French were overjoyed at the result, while the Germans complained openly of their leaders. The former deemed themselves the victors; the latter felt themselves disgraced. The time that was now consumed in negotiations, in which the jealousy of the Austrians and Prussians became more apparent than ever, was improved by the French to bring up reinforcements and strengthen their position, while the ranks of their enemies were being daily thinned by hunger and disease. On the 29th of September the allies began to retreat, and in a few weeks not one of them remained on French soil. But, great as was then the weakness of the Germans, so great is to-day their strength.

The battle of Leipsic, from the 14th to the 19th of October, 1813. It was in this battle, and not at Waterloo, that the first French empire received its fatal thrust; it was here that Napoleon received the blow from which he never recovered. The battles that followed, were only the consequences of Leipsic; and Waterloo, like Zama, a last, desperate effort, was fought by the French, according to Foy, "without fear, 'tis true, but also without hope."

The battle of Sadowa, July 3, 1866, in which the Prussians defeated the Austrians. The result was the dissolution of the German Confederation, the establishment of Prussian supremacy in Germany, and ultimately the union of the German states into one empire.

The battle of Sedan, September 1, 1870, resulted in the defeat of the most powerful of the French armies, and led to a capitulation that has no parallel in the world's history. And the emperor, Napoleon III., himself awoke on the morning of September 5th a prisoner-of-war, in a German castle, near Cassel, to find that his coveted conquests were only—a dream.

And, while the Germans advanced on Paris, the Italians entered Rome and consummated Italian unity.

THE WARNING.

FROM A SERIES OF DRAMATIC LYRICS.

PATIENCE! I yet may pierce the rind
Wherewith are shrewdly girded round
The subtle secrets of his mind.

A dark, unwholesome core is bound,
Perchance, within it. Sir, you see,
Men are not what they seem to be!

A candid mien, and plausible tongue;
A bearing, calmly frank and fair;
The tear ('twould seem) by pity wrung—
All these are his; but still, beware!
A something strange, false, unbegot
Of virtue, whispers: "*Trust him not!*"

But yesterday, his mask (I know
He wears one), for a moment's space,
By chance dropped off; and swift, below
The smile just waning on his face,
I caught a look, flashed sudden, keen
As lightning, which he deemed unseen.

I will not pause to tell thee *what*
That look betrayed: enough, I think,
To smite the spirit cold and hot
By turns, and make one inly shrink
From contact with a soul that keeps
Such wild-fire smouldering in its deeps.

So, friend, be warned! He is not one
Thy youth should trust, for all his smiles;
Frank foreheads, genial as the sun,
May hide a thousand treacherous wiles,
And tones like music's honeyed flow
May work—God knows!—the bitterest woe.

PAUL H. HAYNE.

as it seems to be ordained that, in great things as well as in small, little is achieved in the way of real progress without fighting hard battles and making heavy sacrifices.

But great national struggles must necessarily have their crises. After two nations have long contended for supremacy, the one over the other, a decision is finally reached—a decision which, it is true, might have safely been predicted, but often comes so suddenly, and under such circumstances, that we are inclined to attribute it to the genius of an individual or to accident, as was recently the case with the *Paris Figaro*, in its great ignorance, in attributing the immense success of the German armies, in the present Franco-Germanic War, solely to the genius of General von Moltke.

The condition of the French for carrying on a war, it is true, was wretched; but that of the allies was not much better. In France, however, there was union and no want of enthusiasm; in Germany, on the contrary, there existed a spirit of disunion and jealousy. The war had no sooner begun, than the leaders, on both sides, discovered that they had to fight their battles with unschooled, half-armed soldiers, and that they were not only poorly supplied with money, but also with provisions. Nevertheless, the allies invaded France, in the neighborhood, indeed, where the recent battles have been fought. On the 2d of August a corps of Austrians, under Prince Hohenlohe, advanced from Mannheim, meeting some little opposition on the part of the French near Landau. On the 22d, they reached Merzig, crossed the Moselle, besieged Thionville, and covered the left wing of the main army. In the mean time, Clairfait advanced from the Netherlands with fifteen thousand Austrians, and, on the 16th, united with the Prussians at Arlon. On the 20th they besieged Longwy, which surrendered on the 23d with its garrison of twenty-six hundred men. The French now redoubled their efforts to repel the invaders. Some ten miles from Verdun are the passes of the forest of Argonne. They were guarded by the army of Kellermann and Dumouriez. The condition of their forces was absolutely wretched, half-armed, unorganized, and poorly fed and clad. They numbered about sixty thousand. If the Duke of Brunswick had been expeditious in possessing himself of the heights between Verdun and Ménéhoult, the republicans would have been lost. But the duke hesitated, and the enemy, without opposition, on the 4th of September, intrenched themselves in the pass of Grandpré, and, on the 5th, in that of Islettes. The allied Austrians and Prussians succeeded, it is true, in driving the republicans out of Grandpré on the 14th; but they failed to pursue the retreating enemy. Although the Germans numbered only forty thousand, they should have proved more than a match for the French, on account of their greater experience and better organization. It was not until the republicans had united all their forces on the heights of Valmy, that a pitched battle was fought. The German artillery was, even then, so

admirably served, that it threw the republican ranks into general confusion. A bayonet-charge would have decided the day in favor of the allies; but, owing to a difference of opinion on the part of the German leaders, it was not made, and consequently the battle remained undecided. The French were overjoyed at the result, while the Germans complained openly of their leaders. The former deemed themselves the victors; the latter felt themselves disgraced. The time that was now consumed in negotiations, in which the jealousy of the Austrians and Prussians became more apparent than ever, was improved by the French to bring up reinforcements and strengthen their position, while the ranks of their enemies were being daily thinned by hunger and disease. On the 29th of September the allies began to retreat, and in a few weeks not one of them remained on French soil. But, great as was then the weakness of the Germans, so great is to-day their strength.

The battle of Leipsic, from the 14th to the 19th of October, 1813. It was in this battle, and not at Waterloo, that the first French empire received its fatal thrust; it was here that Napoleon received the blow from which he never recovered. The battles that followed, were only the consequences of Leipsic; and Waterloo, like Zama, a last, desperate effort, was fought by the French, according to Foy, "without fear, 'tis true, but also without hope."

The battle of Sadowa, July 3, 1866, in which the Prussians defeated the Austrians. The result was the dissolution of the German Confederation, the establishment of Prussian supremacy in Germany, and ultimately the union of the German states into one empire.

The battle of Sedan, September 1, 1870, resulted in the defeat of the most powerful of the French armies, and led to a capitulation that has no parallel in the world's history. And the emperor, Napoleon III., himself awoke on the morning of September 5th a prisoner-of-war, in a German castle, near Cassel, to find that his coveted conquests were only—a dream.

And, while the Germans advanced on Paris, the Italians entered Rome and consummated Italian unity.

THE WARNING.

FROM A SERIES OF DRAMATIC LYRICS.

PATIENCE! I yet may pierce the rind
Wherewith are shrewdly girded round
The subtle secrets of his mind.

A dark, unwholesome core is bound,
Perchance, within it. Sir, you see,
Men are not what they seem to be!

A candid mien, and plausible tongue;
A bearing, calmly frank and fair;
The tear ('twould seem) by pity wrung—
All these are his; but still, beware!
A something strange, false, unbegot
Of virtue, whispers: "*Trust him not!*"

But yesterday, his mask (I know
He wears one), for a moment's space,
By chance dropped off; and swift, below
The smile just waning on his face,
I caught a look, flashed sudden, keen
As lightning, which he deemed unseen.

I will not pause to tell thee *what*
That look betrayed: enough, I think,
To smite the spirit cold and hot
By turns, and make one inly shrink
From contact with a soul that keeps
Such wild-fire smouldering in its depths.

So, friend, be warned! He is not one
Thy youth should trust, for all his smiles;
Frank foreheads, genial as the sun,
May hide a thousand treacherous wiles,
And tones like music's honeyed flow
May work—God knows!—the bitterest woe.

PAUL H. HAYNE.

TABLE-TALK.

THE much-vexed question of the Bible in schools is perplexing our English brethren as well as ourselves. In the December number of the *Contemporary Review* it is discussed by Professor Huxley in his usual clear and interesting manner, and with the expression of views on the subject which, we think, will rather surprise those who have been led to regard the professor as little better than an atheist. He says:

"My belief is, that no human being, and no society composed of human beings, ever did, or ever will, come to much, unless their conduct was governed and guided by the love of some ethical ideal. Undoubtedly, your gutter-child may be converted by mere intellectual drill into 'the subtlest of all the beasts of the field;' but we know what has become of the original of that description, and there is no need to increase the number of those who imitate him successfully, without being aided by the rules. And if I were compelled to choose for one of my own children, between a school in which real religious instruction is given, and one without it, I should prefer the former, even though the child might have to take a good deal of theology with it. Nineteenth of a dose of bark is mere half-rotten wood; but one swallows it for the sake of the particles of quinine, the beneficial effect of which may be weakened, but is not destroyed, by the wooden dilution, unless in a few cases of exceptionally tender stomachs.

"Hence, when the great mass of the English people declare that they want to have the children in the elementary schools taught the Bible, and, when it is plain from the terms of the act, the debates in and out of Parliament, and especially the emphatic declarations of the vice-president of the council, that it was intended that such Bible-reading should be permitted, unless good cause for prohibiting it could be shown, I do not see what reason there is for opposing that wish. Certainly I, individually, could with no shadow of consistency oppose the teaching of the children of other people to do what my own children are taught to do. And, even if the reading of the Bible were not, as I think it is, consonant with political reason and justice, and with a desire to act in the spirit of the education measure, I am disposed to think that it might still be well to read that book in the elementary schools.

"I have always been strongly in favor of secular education, in the sense of education without theology; but I must confess I have been no less seriously perplexed to know by what practical measures the religious feeling, which is the essential basis of conduct, was to be kept up, in the present utterly chaotic state of opinion on these matters, without the use of the Bible. The pagan moralists lack life and color, and even the noble Stoic, Marcus Antoninus, is too high and refined for an ordinary child. Take the Bible as a whole; make the severest deductions which fair criticism can dictate for shortcomings and positive errors; eliminate, as a sensible lay teacher would do, if left to himself, all that it is not desirable for children to occupy themselves with—and there still remains in this old literature a vast residuum of moral beauty and grandeur. And then consider the great historical fact that, for three centuries, this book has been woven into the life of all that is best and noblest in English history; that it has become the national epic of Britain, and is familiar to noble and simple, from John-o'-Groat's House to Land's End, as Dante and Tasso were once to the Italians; that it is written in the noblest and purest English, and

abounds in exquisite beauties of mere literary form; and, finally, that it forbids the veriest hind who never left his village to be ignorant of the existence of other countries and other civilizations, and of a great past, stretching back to the farthest limits of the oldest nations in the world. By the study of what other book could children be so much humanized and made to feel that each figure in that vast historical procession fills, like themselves, but a momentary space in the interval between two eternities; and earns the blessings or the curses of all time, according to its effort to do good and hate evil, even as they also are earning their payment for their work?

"On the whole, then, I am in favor of reading the Bible, with such grammatical, geographical, and historical explanations by a lay teacher as may be needful, with rigid exclusion of any further theological teaching than that contained in the Bible itself. And, in stating what this is, the teacher would do well not to go beyond the precise words of the Bible; for, if he does, he will, in the first place, undertake a task beyond his strength, seeing that all the Jewish and Christian sects have been at work upon that subject for more than two thousand years, and have not yet arrived, and are not in the least likely to arrive, at an agreement; and, in the second place, he will certainly begin to teach something distinctively denominational, and thereby come into violent collision with the act of Parliament. . . . Some of the pleasantest recollections of my childhood are connected with the voluntary study of an ancient Bible, which belonged to my grandmother. There were splendid pictures in it, to be sure; but I recollect little or nothing about them save a portrait of the high-priest in his vestments. What come vividly back on my mind are remembrances of my delight in the histories of Joseph and of David; and of my keen appreciation of the chivalrous kindness of Abraham in his dealings with Lot. Like a sudden flash there returns back upon me my utter scorn of the pettifogging meanness of Jacob, and my sympathetic grief over the heart-breaking lamentation of the cheated Esau, 'Hast thou not a blessing for me also, O my father?' And I see, as in a cloud, pictures of the grand phantasmagoria of the Book of Revelation. I enumerate, as they issue, the childish impressions which come crowding out of the pigeon-holes in my brain, in which they have lain almost undisturbed for forty years. I prize them as an evidence that a child of five or six years old, left to his own devices, may be deeply interested in the Bible, and draw sound moral sustenance from it."

— A recent number of the *Galaxy* contained an article on "International Copyright," in which occurred the assertion that no great literature could be written in the intervals of business. To this statement we demurred in the *JOURNAL* of December 17th, and this demurrer has elicited the following communication from the author of the article in question:

"To the Editor of *Appletons' Journal* :

"You object to my characterization of a literature 'written in the intervals of business,' as 'too wide and sweeping.' When a manifold and complicated subject has to be discussed in a limited space, it is difficult to avoid making broad statements; but in this case, being fully aware of the exceptions, I began by referring to them, and giving instances. Some of your additions strike me as more apparent than real. Rogers can hardly be seriously called a banker, any more than the young men of fortune who 'hang out a shingle in our cities' are real, hard-working lawyers; and I doubt very much if

George Grote is, or ever was, a man of business in our American sense of the term. Has he been, I do not see how he could possibly have found time to compose his 'History,' a book which represents twenty years' hard work, the actual writing out of the twelve large volumes being only a portion of the labor involved in it. Many European gentlemen inherit positions in banking establishments, and are so far partners as to receive a share of the profits, but do not take active part in the business. I know that, when I wanted to see Mr. Grote in London, I always went to his private residence. I should never have thought of going to the counting-house of Prescott, Grote & Co.; for which reasons and others, speaking of Mr. Grote in this same article, I classed him not with the men-of-business authors, but with the wealthy amateur authors.

"The *Saturday Review's* remarks which you quote I construe as referring to the tendency of certain professions rather than the time which they occupy. For instance, we do not expect a man who is called a banker to write classical history; all his *milieu*, as Taine would call it, tends in another direction.

"Of course, if no important literary works were ever written by men of business, there would be no foundation for the popular error which I attacked. My object was, to show that these instances were exceptional, and not sufficient to form a general rule."

— The old New-York custom of New-Year calls is becoming, we believe, gradually naturalized in other cities. In Washington it has always been formally observed by our public men; but the great number of dignitaries in that city, who receive on New-Year's changes the custom somewhat from ours; in New York it is distinctly the ladies, as a class, who receive, and the men who near uniformly visit. We hear every year some croakers who declare the custom is on the decline with us, but we do not believe it. We have heard the same assertion made every year, as long as we can recollect—and that longer than we mean publicly to confess. It is, to our mind, a choice fashion, and renders New-Year's-day the most agreeable holiday of the year. Enjoyment on other public holidays is often forced, and sometimes the occasion proves more wearisome than pleasurable. But on New-Year's all the town is in the happiest mood and in its best adornment. It is a day of brilliant changes, of gay *contres*, of sparkling interludes, of lively gossip, of beautiful faces, of exquisite toilet, of pleasant compliments, of reciprocal admiration, of kindly words, of generous cheer, of general good-will. It is a day that enlarges and brightens social intercourse, and one that always freshens acquaintances, and often restores friendships. It is a day of reunion and of pleasant pledges; and every man is entirely insensible to the charms of society. It has found in its observance some of his most agreeable experiences, or dated from it some of his greatest felicities. When the entire female population of a town have decked themselves in their most fascinating attire, and the entire male population are brushed and curled and scented, how can the mutual encounter of these admired and admirers be otherwise than enjoyable!

— Will the gentlemen who direct the affairs of the Young Men's Christian Association

diation of this city permit us to offer them a suggestion? The matter is unimportant, perhaps; but it may be worth heeding. They live in their new building a fine lecture-room. It is spacious, without being too large; it is handsomely ornamented; and it is provided with very comfortable seats. There is nothing lacking in the auditorium; but there are certain errors of omission, in regard to the speaker's platform, that should receive attention. Recently it was our pleasure to listen to a lecture in this room by a gifted lady of New England. She was elegantly dressed, but her splendid drapery swept a bare and by no means clean floor, and the background against which she stood was the cold and unfurnished wainscot. Now, the platform of a lecture-room should present a pleasing picture to the eye, and every speaker should stand out before the audience in relief against suitable colors. "Good gracious!" exclaimed the lady already referred to, when she first visited the hall; "what a background you have given me!" Every speaker of taste appreciates the value of agreeable accessories to the picture of which he or she becomes the central object, and some speakers insist upon a suitable adjustment of accessories before they will consent to present themselves to an audience. A bare floor upon a platform is an abomination. The poorest and the meanest of provincial theatres will usually have as much as a green baize to cover the nakedness of the boards. Actors, however, have almost always a knowledge of effect. If the Lecture Committee of the Young Men's Christian Association will have the platform of their lecture-room nicely carpeted, and either hang the wall with drapery, or have movable screens, richly upholstered, they will render their hall more popular with both lecturers and auditors. And this hint, we hope, will reach other lecture committees throughout the country.

— November, this year, achieved a new and unexpected reputation. Tom Hood's famous lines, for once, could not apply, and the traditional lamentations about the "melancholy days" and the "cold November rain" were hushed. The days were bright, warm, and delicious, not only through November, but far into December. And yet there was little or no Indian summer—that season of which no two people seem to agree as to period or characteristics. Some careless persons attribute every fine "spell of weather," from September to January, to the Indian summer, just as others call every storm, from August to November, or from February to May, the equinox. Careful observers declare that, of all those fine days that succeeded each other in almost unbroken succession during November and in early December of this year, but one day assumed the legitimate conditions of Indian summer, when "twinkle in the smoky light the waters of the Nile." True Indian summer is not brilliant weather. It is smoky and hazy; the air is perfectly still and moist; and the sun shines dimly, but softly and sweetly, through an atmosphere that some call copper-colored, and others golden, in accordance, we suppose, with different poetical perceptions. Of this sort of weather, November, this year, gave us

but little; in fact, the month put on almost an entire new livery, and seemed bent on attaining a better and happier estimation than it has hitherto enjoyed. The truth is, the seasons appear continually to be trying to falsify the current traditions. The spring months, of whose soft airs the poets sing so much, have in recent years tormented us with ceaseless east winds and cold storms; and now, as if to balance this perversity, the one-time dark and dull November has nothing for us but bright skies and warm suns.

— We have all of us at different times deplored the decadence of manners, and longed for those earlier periods when a high-toned courtesy pervaded the intercourse between men and women, and men and men. As an illustration of our lamentable falling-off in good breeding, we quote from the last number of the *Gentleman's Magazine* an anecdote of George IV. when he was prince regent, which depicts in strong colors the superiority of the gentlemen of the old school in all that pertains to manners: "At a small dinner-party at Carlton House, Colonel Hamlyn, one of the boon companions of the prince, told a story which, like most of the stories of the regency, was more distinguished by its point than its propriety. When Colonel Hamlyn had finished it, the "First Gentleman in Europe" filled his glass and threw its contents into his guest's face, saying: 'Hamlyn, you are a blackguard.' What was the colonel to do? To challenge the regent was treason; and yet to return the insult in kind was to take a course which must have compelled the prince, as a gentleman, to challenge the colonel, or to ask some one to take up the quarrel for him. And yet to sit still was impossible. Colonel Hamlyn solved the difficulty by filling his glass and throwing the wine into the face of his next companion. 'His royal highness's toast—pass it on!' This was wit in action. It sealed Colonel Hamlyn's friendship with George IV. 'Hamlyn,' he said, with a slap on the shoulder, 'you're a capital fellow. Here's a toast to you.'"

— The French, just now, filled with not unnatural rage and excitement, are talking rather wildly about the Germans as "barbarians." But here is what one of the most profound thinkers and most acute observers of France, M. Taine, said of the Germans just before the war broke out: "The Germanic people of the present day, and throughout history, are, primarily, the great laborers of the world; in matters of intellect none equal them; in erudition, in philosophy, in the most crabbed linguistic studies, in voluminous editions, dictionaries and other compilations, in researches of the laboratory, in all science, in short, whatever stern and hard but necessary and preparatory work there is to be done, that is their province; patiently, and with most commendable self-sacrifice, they hew out every stone that enters into the edifice of modern times."

Scientific Notes.

Military Chemistry.

THERE is one department in the British service which has been of the most essen-

tial utility ever since its establishment, viz., the Department of Chemistry. It was, says the *Public Ledger*, formed during the Crimean war, at the suggestion of the illustrious Faraday, to check the frauds of the contractors for army supplies at that time. The Minister of War allotted to it a large space in Woolwich Arsenal, fitted up with laboratories, provided with every species of apparatus, with fine balances for estimating results, with the most powerful microscopes, with machinery for analyzing gases, with photographic studios, etc., all of which were placed under the control of a distinguished professor of chemistry, and half a dozen well-skilled, practical assistants, whose time is fully employed in a variety of matters, and just now, especially, in testing metal for the manufacture of guns and projectiles, in examining the elements of gunpowder, in analyzing the stores and food of the soldier, and in many other experiments of a similar kind.

It is somewhat surprising that such an establishment was not founded long ago, familiar as all the world is with the tricks of contractors in times of public necessity, as during a war. It is a melancholy fact that there should exist a class of men who have no scruple in sacrificing, not merely the health and lives of their fellow-men, but the very safety and existence of their country, in order that they may make money out of its necessities.

We need only turn our eyes to France at the present moment for a sample of what these men are capable of. What French contractors have done lately, English contractors did during the Crimean War, and American contractors did during our civil war. The guilt seems to be characteristic of the class generally, and not of any one nation in particular. But the good effects of such an institution as the British Military Department of Chemistry were shown in the recent Abyssinian War, when, out of a large number of articles supplied to the troops, none were complained of, for they had previously been tested by the department.

The rule now is that, when tenders are sent in for supplying stores to the army, the contractors are bound to forward, at the same time, specimens of the material they intend to supply. These samples are carefully tested in the Chemical Department, and the firm that offers the most suitable articles at the lowest prices receives an order to supply the goods. Subsequently, when these are sent in, a further examination takes place to ascertain whether they are equal to the samples first submitted, and only if this proves to be the case are the stores accepted and paid for.

The number and variety of the articles operated upon are extraordinary. Almost all the belongings of the soldier pass in one way or other under the eyes of these chemical detectives. The cloth of his coat, the thread with which it is sewed, the gold lace, the accoutrements, are all tested, and the buttons he wears must be covered with a film of metal sufficiently strong to withstand the action of the acid which the chemist applies to them. The bread, milk, flour, biscuit, preserved meat, vegetables, fruit, etc., of his rations are periodically sent to Woolwich to be tested, and it is said that the system has been so rigorously applied throughout the service that, even at remote stations, flagrant cases of fraud are now rare.

Considerable pains are taken to provide wholesome drinking-water in barracks, and a very large portion of the work of the Chemical Department is devoted to this point. Specimens of the water used at the military stations abroad as well as at home are forwarded to the arsenal for analysis, and reports as to its qualities, together with advice to the commanding officers, are sent to the different stations.

Barrack and equipment stores are not forgotten. Soap, candles, oils, coal, coke, emery-dust, varnish, blacking, paper-hangings, and all kinds of paint, are analyzed carefully in order to prevent the injurious action of arsenic, lead, and other poisonous metals. Soap, in particular, is always severely tested, by reason of the facility with which it may be adulterated, and because it is used in such large quantities.

Very great vigilance is also exercised over camp equipage; the making of the canvas un-inflammable and unfavorable to the formation of mildew, the perfecting of the india-rubber coating for the ground sheets on which the soldier spreads his blankets, and other like cares, also occupy the department. The services it has rendered are immense. The condition of the modern soldier is very different from that of the soldier of even half a century ago, when he was looked upon as little better than food for powder.

A party of scientific men have established themselves for the winter on the top of Mount Washington, in New Hampshire, where for months they will be isolated from the rest of the world, and will experience all the rigors of an arctic climate, in addition to the fury of winds whirling along at a velocity of one hundred miles an hour. The party consists of Professor J. H. Huntington, of Dartmouth College, Assistant State Geologist; S. A. Nelson, of Georgetown, Massachusetts; A. F. Clough, photographer; and a telegrapher. The building occupied is sixty by seventy-two, and twenty-five feet high. The main room is twenty-five feet by eleven, lined with triple thicknesses of felt, and thickly carpeted. Six months' provisions and abundance of coal have been provided. Snow-shoes have also been sent up, to be used in cases of emergency. The United States Government, the Coast Survey, and the Smithsonian Institute, have all manifested an interest in the enterprise, and all needed instruments have been furnished for scientific purposes. The War Department has furnished telegraphic supplies, meteorological instruments, and three miles of Kinte telegraph-cable, which is affected by weather less even than the ocean-cables. This connects with a common wire at the base of the mountain, and daily reports of the weather will be sent to the world. It is expected these reports will benefit commerce by enabling the shipmaster to determine, a day beforehand, that a storm is coming; or, during a storm, that fair weather is at hand—and thus forewarn him of destructive storms and keep him safely in port, or save a day's time by enabling him to anticipate the conclusion of stormy weather and set sail at once.

In a recent number of the *Pharmaceutical Journal* a paper appears, by Mr. Cooke, on the guarana, the seeds of a tree termed the *Paulina sorbilis*, belonging to the order *Sapindaceæ*, and abundant in the province of the Amazonas. The fruit is scarcely as large as a walnut, and contains five or six seeds, which are roasted, then mixed with water, and moulded into a cylindrical form resembling a large sausage, and finally dried in an oven. Before being used it is grated into a powder, very like powdered cacao in appearance. Two spoonfuls of the powder are mixed in a tumbler of water, and this drink is regarded as a stimulant to the nerves, and, like strong tea or coffee, is said to take away the disposition to sleep. The active chemical principle is an alkaloid, which Dr. Stenhouse has shown to be identical with theine. Guarana contains more than double as much of this alkaloid as good black tea, and five times as much as coffee, the proportion

being 5.07 per cent. in guarana. It is rather a singular coincidence that the same alkaloid should prevail in all the principal substances employed in a similar manner as beverages in different parts of the world, in the tea of China and India, the coffee of Arabia, the cacao of Central America, the mate of South America, and the guarana of Brazil. Guarana is a nervous stimulative and restorative.

A remarkably low wave of temperature passed over the British Islands in the middle of November. At Blackheath the mean temperature for the week ending November 16th was nearly 7° below the average. It is remarkable that the wind was in the west-southwest during nearly the whole of the week, the air being almost saturated with moisture, and yet the rainfall scarcely appreciable—0.04 inch. For the fourteen stations in England, eight in Scotland, and one in Ireland, recorded in the *Gardener's Chronicle*, the lowest minimum was 19.0° at Paisley, the highest, 31.5°, at Norwich. The mean temperature was nearly the same in Scotland as in England, about 37.5°. Another singular meteorological phenomenon occurred the next week in the successive thunder-storms which burst over London from three A. M. on Tuesday morning the 22d to six A. M. on Wednesday morning the 23d. The wind was blowing strongly from the southwest during the whole time, with occasional violent rain, and the average temperature was about 40° F.

When the Russian American Telegraph is completed, the following feat will be possible: A telegram from Alaska for New York, leaving Sitka, say at forty minutes past six on Monday morning, would be received at Nikolaiev, Siberia, at six minutes past one on Tuesday morning; at St. Petersburg, Russia, at three minutes past six on Monday evening; at London, twenty-two minutes past four on Monday afternoon; and at New York at forty-six minutes past eleven on Monday forenoon. Thus, allowing twenty minutes for each retransmission, a message may start on the morning of one day, to be received and transmitted the next day, again received and sent on the afternoon of the day it starts, and finally reaches its destination on the forenoon on the first day, the whole taking place in one hour's time.

An interesting exhibition of fruit was recently opened at Appenzell, Switzerland. Eight communes furnished six hundred and eighty-nine exhibits, comprising eighty sorts of apples and one hundred and twenty of pears. The fruits were arranged according to the height above the sea of the localities where they are grown. Thus, in the lowest zone were shown fruits produced from thirteen hundred to two thousand feet above the sea; in the next, those grown at an elevation of two thousand to twenty-six hundred feet; in the third group, those gathered at a height of twenty-six hundred to three thousand feet; and lastly, were exhibited fruits produced above the last-mentioned elevation. Great care was taken to insure the accurate nomenclature of the fruits exhibited.

War Notes.

Fortified Capitals.

IF there is any military question which the experience of the present war may be said to have finally settled, it is that of the expediency of fortifying the capital of a great state. Ever since the day when the fortification of Paris was resolved upon, the controversy as to the usefulness or otherwise, and even as to the possibility of defending such a vast fortress,

has been going on in the military literature of all countries. Nothing could settle it but practical experience—the actual siege of Paris, the only fortified capital in existence; and, though the real siege of Paris has not yet begun, the fortifications of Paris have rendered such immense services to France already that the question is as good as decided in their favor.

On the 2d of September the last French army in the field capitulated. And now, nearly four months afterward, almost one-half of the German troops in France are still held fast around Paris, while the greater portion of the remainder are hurried forward from Metz to protect the investment of Paris against a newly-formed Army of the Loire, an army which, whatever its value may be, could never have even come into existence had it not been for the fortifications of Paris. These fortifications have been invested nearly three months and the preparations for the opening of the regular siege are not yet complete; that is to say, the siege of a fortress of the size of Paris even if defended by none but new levies and determined population, can begin only when that of a common fortress would have been long brought to a successful close. The event has proved that a town holding two million inhabitants can be provisioned almost easier than a smaller fortress exercising less central attraction upon the produce of the surrounding country.

Prices of Provisions on November 11, 1870, in Paris.

(From our Balloon-Correspondence.)

Geese (each).....	f.36.00 (usual price) f.6.4	
Hens	15.00	3.0
Pigeons (pair).....	12.00	2.0
Chickens (pair).....	28.00	5.0
Turkeys (each).....	55.00	10.0
Rabbits (pair).....	36.00	6.0
Smoked ham.....	8.00 per lb.....	2.0
Lyons sausage.....	16.00 "	4.0
Horse-sausage.....	3.00 "	0.0
Preserved Australian meat	4.00 "	0.0
Carp-fish (each).....	30.00	3.0

Salt butter.....	14.00 "	1.0
Salad-oil	5.00 "	0.0
Pork-grease	7.00 "	0.0
Horse-flesh.....	1.50 "	0.0
Ass-flesh.....	3.50	0.0
Charcoal, per cwt. (almost exhausted) 25.00		4.0

The prices of bread and wine have not increased, thanks to the intervention of the Provisional Government. Butcher's-meat is likewise taxed by the Government, but is distributed in daily rations of one and a quarter ounce and can scarcely be regarded as a source of sustenance. Cheese, fish, and fruit, have almost entirely disappeared from the market; the articles selling, as soon as exhibited, at fabulous prices. Large quantities of rice, coffee, chocolate, tapioca, etc., are still exposed at slightly-increased rates. As a general rule, articles, except the foregoing, have increased more than fivefold in price since the investment of Paris.

The London *Times* correspondent at Metz states that he was informed by the man in whose father's house Marshal le Bœuf lived during the siege that he had a dairy and a poultry-yard to the very end, and that he, Bazaine, and the superior officers, lived in luxury to the last. They paid exorbitant prices for the delicacies of the table, but always succeeded in procuring them. "The debauchery and extravagance of the officers were much dwelt upon by the townspeople, who, though not more particularly strait-laced in certain respects than French people are generally, were utterly scandalized by the flagrant immorality of their defenders, who seem to have preferred *cafés* and the society of the *demi-monde* to duty in the trenches, and who to the last denied themselves no enjoyment or luxury which money could purchase or the town afford. It is possible," the writer adds, "that Bazaine may be the traitor he is accused of being; but it seems to me more likely that he and all his officers, as soon as they began to run short of truffles, and found that their female friends got bored with the monotony of the siege, determined to bring it to a close. It is impossible to suppose that the army could not have cut its way out had it been in earnest." General Coffinières, *commandant* of Metz, has written a letter to a Belgian paper to vindicate his part in the surrender of the fortress. His language, too, avows the belief that Bazaine allowed political considerations to influence his military movements; but the general admits that the capitulation was resolved on by a council of war.

A Dane, serving in a corps of franc-tireurs near Paris, gives some interesting particulars in two letters to a Danish paper of the mode of campaigning practised by these free corps. He says that the army investing Paris is now itself invested, as it is surrounded on all sides by franc-tireurs and mobiles. Wherever there is a bridge or a road through a wood, the uhlans may depend on finding irregulars in greater or less numbers. In many places deep ditches, full of palisades, are cut across the roads; sometimes these ditches are defended by barbed-wires. The franc-tireurs never take any prisoners. One of them often lies all night, from 7 P. M. to 4 A. M., on the damp ground, under strict orders not to stir or talk to his comrades—"a great sacrifice," observes the writer, "for a Frenchman to make." The strongest and best commanded of the franc-tireur bands is that known as the "Moquards." This band, which numbers twelve hundred men, is divided into two battalions, and consists chiefly of the remains of the regiments which capitulated at Sedan. They are very ragged, but are all armed with Chassepots, and they do a great deal of harm to the enemy.

The animals in the famous Jardin des Plantes are reported as in a bad way through the siege of Paris. The elephants are getting weak on their pins, like so many broken-down cricketers; the lions are put on short commons; the hippopotamus looks morose, and the black bear keeps climbing up his tree and dropping down again, as if he had discovered perpetual motion. He roars as supplicatingly as any lady's lap-dog, but very few crumbs of comfort, we fear, fall into his pit nowadays. The thoughtless monkeys and the patient camels are the only animals that seem to take this siege in the proper spirit. A curiosity in its way is the *faucun* eagle from whose wing the quill was picked that signed the peace of Villafranca. He is as melancholy as if he were conscious that the dynasty which had adopted him for its type had taken its flight from the Tuileries. He is no longer the proud bird that

soars and stares sunward, but a wretched, depressed prisoner, with dull eyes and ragged plumage, an eagle *ramolli*, such a one as might have furnished a quill to sign the capitulation of Sedan.

The French emperor, on receiving General Boyer at Wilhelmshöhe, is said to have commented on the sudden change of opinion respecting himself in Paris, where the enthusiasm for him in consequence of the declaration of war was almost oppressive. "When," he said, "I was on the point of starting for the army, I intended going from St. Cloud through Paris. The Prefect of Police, however, assured me that the enthusiasm of the population was such that they would take the horses out of the carriage in order to drag it, that they would throng the streets, and that all sorts of extraordinary proceedings were to be feared. I was, therefore, obliged to abandon my plan. And now you see the same people follow with the same enthusiasm the banner of a few street heroes. We shall see whether they make a better hand of it."

Russia covets,
Turkey fears;
Austria ponders,
Italia cheers.
Belgium—Holland,
Wait in dread;
Denmark's palsied,
Spain is dead.
France lies bleeding,
Prussia soars;
Britannia shuts her eyes
And—*enores!*!

A new style of journal has been set up in Paris since the siege. It has the form of an ordinary letter, and is called *Lettre Journal de Paris, Gazette des Absents*. The first two pages contain a summary of the news of the week; the third page is free to contain the substance of the letter; and the fourth bears the address of the person for whom it is destined, who receives a Parisian journal at the same time as a letter from his besieged relations or friends.

The *Liberté*, of November 2d, reported the following as the "strength of the six French armies outside Paris:" The Army of the Vosges, under General Cambrils, 35,000; the Army of Besançon, commander unknown, 90,000; the Army of the West, under Count de Kératry, 90,000; the Army of the North, under General Bourbaki, 40,000; the Army of the Centre, at Mer, under General Tripart, 90,000; the Army of the Loire, under General d'Aurelles de Paladine, 80,000; total, 425,000.

The German commander in Metz states that fifty-three eagles, five hundred and forty-one field guns, ammunition for more than eighty-five batteries, about eight hundred siege-guns, sixty-six mitrailleurs, about three hundred thousand rifles and sabres, about two thousand military carriages, large quantities of unworked timber and bronze, a valuable factory for manufacturing gunpowder, etc., have been found at Metz.

A German, writing from Metz, says: "Let nobody expect to win the sympathies of these people for generations to come. They hate us more intensely than the French population proper, and, if Metz remains German, only an iron rule will be possible here. Every forbearance and mildness would be misunderstood, and good deeds would fall on stony ground."

The manufacturers of Berlin who have given employment to German workmen expelled from Paris are said to be extremely well satisfied

with the result. A great number of handsome and useful objects, known as articles de Paris, are already produced in that city, quite as elegant as those of the French capital, and considerably cheaper.

According to *Voss's Gazette*, the German soldiers now in France and fitted for service number 690,000, while there are 160,000 horses. The daily requirements of these forces are 250,000 loaves of bread, 185 oxen, 400 cwt. of bacon, 540 cwt. of rice, 160,000 quarts of brandy, and 40 cwt. of coffee, 68,000 cwt. of hay, and large quantities of oats and straw.

The Germans are proceeding systematically with the government of Alsace. The governor has directed that, from the 1st of November, the indirect taxes, including those on beer and spirits, shall be collected in the same manner as before the war. The German geographical names have been officially introduced.

The Prussian medical staff at Metz complain, do what they will, they cannot break the French convalescents of their craving for horseflesh. They will eat it, notwithstanding that they are receiving abundant rations of mutton.

By General von Moltke's letter of thanks, in reply to many addresses sent to him, it appears that he was celebrating his seventy-first and not his seventieth birthday, as was stated first.

There is a story that the Prussians have let fly a large number of hawks in the neighborhood of Paris to wage war upon the French pigeons carrying letters.

The number of French prisoners in Germany is four marshals, one hundred and forty generals, ten thousand officers, and three hundred and twenty-three thousand rank and file.

Miscellany.

A Russian Wolf-hunt.

THE programme of a regular "wolf-hunt" in the provinces is always the same. At some abnormal hour "between the night and the day," you are aroused (almost, as it seems, before you are well asleep) from a rough couch in one of the little log-huts of some outlying village, by a violent shake of the shoulder, and a hoarse voice admonishing you to "get up, and look sharp about it, for there's no time to lose." You make a hasty toilet, and, sallying forth, see in front of the hut, in the dim light of the coming morning, a huge, dark, shapeless mass (which, as your eyes get used to the darkness, assumes the form of a broad, heavy, three-horse sledge, with very high sides, not unlike an enormous washing-tub), around which are flitting three or four spectral figures with lanterns, the flitting glare making their grim, bearded faces look grimmer and less human than ever. Guns, ammunition, haversacks, are stowed away in the bottom of the conveyance—and (last, but not least) a young pig; your query respecting which elicits from the leader of the party only the oracular answer that "it'll come in handy by-and-by;" and, all being now ready, the hunters squeeze themselves into their places, the driver shakes his reins with a "wo-o-oi!" and away we go into the darkness. Mile after mile of the frozen waste goes by like a dream, till at length the spectral shadows of the forest slowly gather round us, and the squeals of our unlucky pig (whose ears one of our party is now pinching lustily) begin to be answered by another sound, which no one who has heard it will easily for-

get—not the long melancholy howl wherewith a supperless wolf may be heard bemoaning himself on the outskirts of Moscow, almost any night in the week, but a quick, snarling cry, as of one who sees his dinner coming, and wishes to hasten the bringer of it. And there they come at last, the gaunt, wiry, slouching fellows, with their bushy tails, and flat, narrow heads, and yellow, thievish, murderous eyes. There is perhaps nothing on earth more thoroughly mean and hateful-looking, at first sight, than the genuine Russian wolf; but the rascal has a certain picturesqueness of his own notwithstanding, though of a disagreeable kind. There is something grand in the dogged and sinister tenacity of his pursuit; coming on, with head thrown forward, and sharp white fangs unsheathed, untiringly and unrelentingly, like a haunting Fate,

"With his long gallop, which can tire
The hound's deep hate and hunter's fire."

But there is no leisure for moralizing now; for the wolves are already almost level with our sledge, and it is time to let fly. Bang! The foremost of the pack rolls over on his side, kicking convulsively; but the rest gallop on unheeding. Bang! bang! and two more fall dead, blotting the snow around them with a smear of dull crimson. Some of the boldest pursuers swarm up to the sledge, and attempt to leap over the encircling barrier; while we hammer them with the butt-ends of our pieces, and chop at their paws with hatchets, and slash them across the eyes with hunting-knives—the two hindmost of our party meanwhile cracking at them over our shoulders as fast as they can load. So for a time the running-fight goes fiercely on, making altogether a very striking tableau. The white, skeleton tracery of the frozen forest; the long, snaky line of the pursuing pack, shadowy and spectral, as if bodied of the mist from which it emerges; the whirling figures of the foremost wolves amid the tossing spray of snow and curling clouds of bluish smoke; the ceaseless flash of the busy rifles; the steaming horses, urged to their utmost speed; the driver, with his broad, sallow face all ablaze with excitement, shaking the reins, and hanging forward to ply the whip; the huge, cumbrous sledge, rocking and reeling over the snow with its freight of struggling forms—all this, seen in the dim, uncertain light of the early dawn, has a weird and ghostly appearance, suggestive of an attack of goblin highwaymen upon one of those phantom mail-coaches in which the bagman's uncle made that marvellous journey which so much astonished Mr. Pickwick. But "the pace is too stiff to last," as our leader observes with a knowing grin. A run at full speed through half-frozen snow tries the feet of even a full-grown wolf too severely to be continued beyond a certain time; and, in the face of a stout resistance, the beast's inherent cowardice is sure to come to the surface sooner or later. Already three or four gaunt, sluggy-haired veterans, who have probably made a good supper over-night, begin to hang back, as if doubting the wisdom of risking their lives for a hypothetical breakfast; the speed of the rest slackens by degrees; and at length the whole pack drop off, as if by tacit agreement, leaving us to pursue our way unmolested. As we emerge again into the open plain, across which the first beams of the rising sun are just beginning to fall, we see the last of our grim followers slinking away like a belated spectre into the ghostly shadows of the forest that we have quitted.

Matrimony by Advertisement.

Parson Keith, of Mayfair notoriety, who in his free-and-easy fashion united many thou-

sand couples in the bonds of matrimony, used to say that, in the generality of cases in which he had officiated, the parties concerned had not known each other more than a week, while in very many instances the acquaintanceship was a matter of hours only. With such evidence of the recklessness with which folks will rush into the state that has only two exits, divorce and death, one can hardly wonder at some men being adventurous enough to seek a wife by advertisement—the most risky way imaginable of going about a business, in its own nature risky enough under the best of conditions.

One of the oldest matrimonial advertisements we know of, and at the same time a good example of the combination of commercial and sentimental ideas characteristic of such announcements, appeared in the *General Advertiser* for March 30, 1748:

"Whereas, on Saturday last, a lady, genteelly dressed, was seen to lead a string of beautiful stone-horses through Edmonton, Tottenham, and Newington—this is to acquaint her that, if she is disengaged and inclinable to marry, a gentleman who was smitten with her behavior on that occasion is desirous of making honorable proposals to her; in which state, if he be not so happy as to please, he will readily purchase the whole string for her satisfaction."

We doubt if any woman ever had a stranger option given her than the fair horse-dealer, or if any horse-dealer ever had a better chance of doing a good stroke of business. This is, however, hardly a fair specimen of matrimonial advertising, since it is addressed to a particular member of the sex, unlike the following from the *Reading Mercury* of September 13, 1798:

"TO THE FAIR SEX: *Ladies*—Being at this time in want of a partner for life, to assist in a multiplicity of business which I am now engaged in, I have taken this public method of informing you. If any young lady of the following description would wish to enter the holy state of matrimony—she must be genteel made, rather tall; black, brown, flaxen, or auburn hair; age from twenty-five to thirty-five; widow or maid; if a fortune, will settle the same upon the lady and offspring, wishing to act upon the strictest honor. Such lady, by letter, post-paid, or personal application, to Mr. Timothy Surrell, yeoman, Quality Court, Charnham Street, Hungerford, Berks, will meet with a welcome reception.

"N. B.—To avoid extra expenses, Mr. Surrell would wish to keep his wedding and harvest-home the same evening, which will be within fourteen days from the present date, as he particularly wishes the lady to preside at table that evening."

Mr. Surrell evidently believed that happy is the wooing that is not long a-doing.

Over the River.

BY MRS. A. C. WAREFIELD.

Over the river they beckon to me,
Loved ones who've crossed to the farther side;
The gleam of their snowy robes I see,
But their voices are lost in the dashing tide.
There's one with ringlets of sunny gold,
And eyes the reflection of heaven's own blue;
He crossed in the twilight, gray and cold,
And the pale mist hid him from mortal view.
We saw not the angels who met him there,
The gates of the city we could not see.
Over the river—over the river—
My brother stands waiting to welcome me.

Over the river the boatman pale
Carried another, the household pet;
Her brown curls waved in the gentle gale—

Darling Minnie! I see her yet.

She crossed on her bosom her dimpled hands,
And fearlessly entered the phantom-bark,
We felt it glide from the silver sands,
And all our sunshine grew strangely dark.
We know she is safe on the farther side,
Where all the ransomed and angels be;
Over the river—the mystic river—
My childhood's idol is waiting for me.

For none return from those quiet shores
Who cross with the boatman cold and pale—
We hear the dip of the golden oars,
And catch a gleam of the snowy sail;
And lo! they have passed from our yearning hearts,
Who cross the stream and are gone for aye.
We may not sunder the veil apart,
That hides from our vision the gates of day.
We only know that their barks no more
May sail with us over life's stormy sea;
Yet somewhere, I know, on the unseen shore
They watch, and beckon, and wait for me.

And I sit and think when the sunset's gold
Is flushing river and hill and shore,
I shall one day stand by the water cold,
And list for the sound of the boatman's oar.
I shall watch for a gleam of the flapping sail,
I shall hear the boat as it gains the strand.
I shall pass from sight with the boatman pale.
To the better shore of the spirit-land;
I shall know the loved who have gone before,
And joyfully sweet will the meeting be,
When over the river—the peaceful river—
The angel of death shall carry me.

A Monarch tired of Business.

A Polish monarch having quitted his companions when he was hunting, his courtier found him, a few days after, in a market-place disguised as a porter, and lending out the use of his shoulders for a few pence. They were so much surprised that they were doubtful at first whether the porter *could* be his majesty. At length they ventured to express their complaints that so great a personage should demean himself by so vile an employment. His majesty, having heard them, replied: "Upon my honor, gentlemen, the load which I quitted is by far heavier than the one you see me carry here; the weightiest is but straw when compared to the world under which I labored. I have slept more in four nights than I have during all my reign. I begin to live, and be kind of myself. Elect whom you choose. For me who am so well, it would be madness to return to court."

Cornell University.

Mr. Goldwin Smith can hardly be said to retain his connection with Cornell University from motives of self-interest. Besides presenting that institution with his private library of three thousand five hundred volumes, he has given it two thousand two hundred dollars for the purchase of books. The university is fortunate in the composition of its library. It comprises thirty thousand volumes, among which eight thousand are the library of the late Charles Anthon, LL. D., and several thousands from that of Professor Popp, the philologist of Berlin. The president of Cornell University, Mr. Andrew White, has long been noted as a collector of curious books, and it is said his collection of French literature and pamphlets is remarkably good. Being wealthy, he is also able to give more to Cornell University than it gives to him; and this year, besides presenting it with twelve hundred volumes on architecture alone, he has given ten thousand dollars' worth of volumes on other subjects. Mr. Cornell, the founder, has

his year given fifteen hundred dollars for the purchase of works on agriculture.

Cowper.

It is not very difficult to point out the causes which have made Cowper one of the most popular among English poets. The purity both of his subjects and of their treatment, the poetic tone which still endears him to the great religious party whose cause he delighted to plead, his domestic sympathies, his love of rural life, his common-sense, the clear, crisp English of his poems, have all had their part in his success. But there are, of course, far deeper causes than these. There are few intellectual qualities which are more delightful than humor, and Cowper was essentially a humorist. The humorous essays in the *Connoisseur* are his earliest prose compositions. "John Ripin" is undoubtedly his most popular work. His letters are models of polite fun—fun as genuine and pleasurable as it is distinct from the wit of Horace Walpole. It is the humorist who "welcomes peaceful evening" with stirred fire and closed curtains, and is seen steaming beside him; who finds his pleasure in peeping "through the loop-holes of etra at such a world" as the Babel around him; who lies awake half the night, convulsed with laughter over his friend's story, and rises next morning to pen the famous ballad of "The Ride to Ware." The well-known legend of the origin of the "Task" brings out the bright light, cheerful badinage which was natural to the man. Cowper asked Lady Austen for a subject. "You can write upon any subject," laughed his friend; "write upon this one." And Cowper at once begins, with a tale upon his lip—

"I sing the Sofa, I who lately sang
Faith, Hope, and Charity!"

and rambles on with a humorist's waywardness—the waywardness of Rabelais or Tristram Shandy.

Varieties.

THE authorities of the French republic have arrested George Francis Train, and sent him to prison in Lyons. He writes to the French people a queer letter, in which he tells them several wholesome truths, and complains that he has been left six days without towel, tooth-brush, or change of linen. He ends by: "Liberty, Equality, Fraternity, have different significations among different nations. In America they mean Steam, Gas, Electricity! In England, Prostitution, Pauperism, Slavery! In Prussia, Infantry, Cavalry, Artillery! In France, Eating, Drinking, and Smoking, unopposed by barbarian invaders! *Vive la République universelle! En avant! Aux armes! Libéria!*"

Confab between inquiring stranger and tourist-pilot.—"That is Black Mountain?" "Yes, sir; highest mountain about Lake Geneva." "Any story or legend connected with that mountain?" "Lots of 'em. Two men went up that mountain once, and never came back again." "Indeed! why, what became of them?" "Went down on the other side."

A private shooting-gallery is attached to the office of the *Alta California*. Ability to shoot a "bull's-eye" twice in three shots, at fifty paces, is an indispensable qualification for honorary admission to the reportorial staff, and promotion is only accorded to increased proficiency, at regular competitive trials of skill and nerve.

Mrs. Agassiz says that, in certain Amazonian tribes, on the day of his marriage, while the wedding festivities are going on, the bridegroom's hands are tied up in a paper bag filled with fire-ants. If he bears the tortures smile-

ingly and unmoved, he is considered fit for the trials of matrimony.

J. J. McElhone, short-hand reporter of the Washington *Globe*, can, it is said, write with both hands at the same time, the left taking notes and the right transcribing. He is said to be the only man in the world who can do this.

The school-visitors of Vernon, Connecticut, solemnly aver that in their opinion the rising generation can never learn to write properly, unless they go back to the goose-quill of their grandfathers.

The English Divorce and Matrimonial Causes Court was established in 1858. Since then it has dissolved fifteen hundred and seventy-five marriages.

There are about two hundred and seventy-five thousand children educated in the public schools of Massachusetts, at an annual cost of some five million dollars.

The shortest name on the roll of the newly-elected Legislature of New Mexico, is Alphonso Ferdinand Senay Garcia Francisco Antonio Cortes Maria Gonsalvo Diego Juarez Mestes!

Brigham Young has recently started a bank at Salt Lake City. The checks are made to read "To the credit of the Lord."

A man's credit must be bad, indeed, when he can't even borrow trouble.

A whole suit of paper clothing costs only twenty-five cents in Japan.

A hen-coop is a *stratum super stratum*—a layer above layer.

A Maine doctor says bilious fever is a mild yellow fever.

Bishop Beckwith, of Georgia, has removed from Macon to Savannah.

Diamonds were first polished and cut in 1439.

The Catholic schools of St. Louis have about eight thousand scholars.

Old Father Time attacks everybody—yet he always takes one of his scythes.

The Museum.

OUR illustration this week is of a rare and curious tooth-billed pigeon recently sent to London from the Samoan, or Navigator's, Islands, in the Pacific Ocean, by the missionary, the Rev. S. J. Whitmee. This bird is a near approximation to the famous dodo. It received its generic name of *didunculus* (little dodo) from its resemblance to that now extinct bird. It has only been found in the Samoan Islands, and will itself before long become extinct. It is now so scarce that the greatest difficulty is experienced in securing a specimen. Few of the natives of the islands have ever seen the bird. Here and there an old man may be found who remembers the time when it was easily procured in the bush, and greatly esteemed as an article of food for the highest chiefs. Those familiar with tales of Samoa in the olden times, say it was once owned as private property, and "preserved" as game is in England at the present day. But this was before the introduction of the fowl into the group. Within a comparatively recent period a travelling-party belonging to the dominant tribe, or clan, on arriving at a village of a subject tribe where they intended to spend the day, would order the chief men of the village to procure them a certain number of the *didunculus* before night. If they failed to provide the birds, a severe endgelling would be the consequence; a punishment which etiquette (or fear) required them meekly to bear.

The *didunculus* roosts on low stumps or roots of trees, and thus readily falls a victim to the wild-cats, which have become numerous in the Samoan Islands, although the cat has been comparatively recently introduced. During the past seven years only six specimens, we believe, have been secured; and these only after patient waiting and watching in the places the bird is known to frequent. It is generally taken when very young, before it becomes strong on the wing; or during the period of incubation, when, in consequence of the closeness with which the birds sit upon the nest, the natives sometimes secure them. The duty of incubation is performed alternately by both male and female.

The native name of the *didunculus* is *Manu-mea*. *Manu* is the generic name for an animal, specially a bird; *mea* indicates the color, meaning yellowish brown, as *sear leaves*. The bird is about twelve inches in length, including the head and tail; and about the same from tip to tip of the extended wings. It has the head of a rapacious bird on the body of a pigeon. In the form of the bill, and several other respects, it differs from all other known species. The upper mandible is convex and strongly hooked at the point. The lower mandible is truncated, and fits into the curve of the upper one; it has also three well-defined teeth on either side of it. There is a membrane in the sides of the upper mandible, in which are placed the elongated nostrils. The bird is powerful on the wing, and flies with a peculiar whirr, resembling the noise made by a pheasant rising in cover more than anything we know. This gives rise to a Samoan phrase, "As noisy as a manu-mea." It has also a remarkable manner of walking with a heavy, clumping sound. It runs very rapidly. In the adult condition the back, upper portion of the wings, and tail, are chocolate-red, exceedingly glossy and beautiful; the head, neck, and breast, are olive or greenish black; the legs and feet bright scarlet; the beak is orange, tipped with yellowish white; claws yellowish white. There is a bright-orange circle around the eyes, the iris of which is dark.

The male bird has a very savage look, and his conduct toward other birds in confinement with him is in keeping with his appearance. The specimen from which our illustration was taken was extremely spiteful to all the other inmates of the aviary, except some very small birds which seemed to be beneath his notice. On the introduction of a new arrival, it invariably had to endure the most implacable persecution from the lord of the aviary. At the end of a week the poor new-comer presented a most pitiable figure, the result of the drubbing it had endured. This was the "footing" which all had to pay, after which matters went on peaceably so long as the underlings did not forget their subject condition. Yet our *didunculus* was a very shy bird, and never would become tame, even with those constantly feeding it. When approached it would run into a corner, or flutter about in fright. It never attempted to bite when taken in the hand. At feeding-time it would sit at a safe distance eying the food, the body quivering with a singular vibration from head to tail. This appeared to be rage at seeing the tamer birds come near to the person feeding them, and taking a first share of the food. The same vibration of the body is often noticed when it is approached; it is probably produced both by fear and rage. As soon as the person feeding them had retired, he would fly to the food, driving the other birds pell-mell, and eat in solitary dignity till he had satisfied himself.

The illustration will show the general ap-

pearance and habit of the bird. It is taken in the act of feeding upon the fruit of the papaw, of which it is very fond in its confinement. It is also fed upon cooked taro and bread-fruit. When at liberty it feeds chiefly upon a species of wild yam.

Didunculus, or Little Dodo, a rare bird from Samoa.

VICK'S FLORAL GUIDE FOR 1871.

THE FIRST EDITION OF ONE HUNDRED AND FIFTY THOUSAND copies of **Vick's Illustrated Catalogue of Seeds, and Floral Guide**, is published, and ready to send out—100 pages, and an Engraving of almost every desirable Flower and Vegetable. It is elegantly printed on fine tinted paper, illustrated with Three Hundred fine Wood Engravings and two beautiful

COLORED PLATES.

The most beautiful and the most instructive Floral Guide published. A German Edition published, in all other respects similar to the English.

Sent free to all my customers of 1870, as rapidly as possible, without application. Sent to all others, who order them, for **Ten Cents**, which is not half the cost. Address

JAMES VICK, Rochester, N. Y.

The Highest Premiums on all Competitions both in America and in Europe.

Great Reduction in Prices.

CHICKERING & SONS

Piano-forte Manufacturers.

We call the attention of persons intending to purchase Pianos to our new Illustrated Catalogue and Price List. Having adopted, and strictly adhering to the

One-Price System,

we now offer inducements to purchasers which cannot be surpassed.

Rosewood 7-octave Square Piano, Agraffe Bridge, carved Legs and Lyre, and all modern improvements for \$475. Our object is to furnish to our patrons the very Best Piano which can be manufactured, and at the very Lowest Price which shall insure the most Perfect Workmanship, and the very best quality of materials used in every branch of the business. Every Piano sold is fully warranted for five years. Illustrated Catalogues sent by mail, on application. Orders sent to us, direct, will meet with prompt attention, and satisfaction guaranteed.

CHAPTER XXXIX.

HORSE-LEECHES.

THE honor of representing the borough of Percycross in Parliament was very great, and Sir Thomas, no doubt, did enjoy it after a fashion; but it was by no means an unalloyed pleasure. While he was still in bed with his broken arm at the Percy Standard, many applications for money had been made to him. This man wanted a sovereign, that man a five-pound note, and some poor, starving wretch a half crown; and they all came to him with notes from Trigger, or messages from Spicer or Spiveycomb, to the effect that, as the election was now over, the money ought to be given. The landlord of the Percy Standard was on such occasion very hard upon him. “It really will do good, Sir Thomas.” “It is wanted, Sir Thomas.” “It will make a good feeling in the town, Sir Thomas, and we don’t know how soon we may have to go to work again.” Sir Thomas was too weak in health to refuse. He gave the sovereigns, the five-pound notes, and the half-crowns, and hurried back home as quickly as he was able.

But things were almost worse with him at home than at Percycross. The real horse-leeches felt that they could hardly get a good hold of him while he was lying at the Percycross inn. Attacks by letter were, they well knew, more fatal than those made personally, and they waited. The first that came was from Mr. Pabsby. Mr. Pabsby had at last seen his way clear, and had voted for Underwood and Westmacott, absolutely throwing away

his vote as far as the cause was concerned. But Mr. Pabsby had quarrelled with Griffenbottom, who once, when pressed hard for some favors, had answered the reverend gentleman somewhat roughly.

“You may go and be —,” said Mr. Griffenbottom, in his wrath, “and tell everybody in Percycross that I said so.”

Mr. Pabsby had smiled, had gone away, and had now voted for Mr. Westmacott. Mr. Pabsby was indeed a horse-leech of the severest kind. There had been some outward show of reconciliation between Griffenbottom

and Pabsby; but Pabsby had at last voted for Underwood and Westmacott. Sir Thomas had not been home two days before he received a letter from Mr. Pabsby.

“It had been with infinite satisfaction”—so Mr. Pabsby now said—“that he had at length seen his way clearly, and found himself able to support his friend Sir Thomas. And he believed that he might take upon himself to say that, when he once had seen his way clearly, he had put his shoulder to the wheel gallantly.”

In fact, it was to be inferred from the contents of Mr. Pabsby’s letter that Sir Thomas’s return had been due altogether to Mr. Pabsby’s flock, who had, so said Mr. Pabsby, been guided in the matter altogether by his advice. Then he sent a list of his “hearers,” who had voted for Sir Thomas. From this the slight change of subject needed to bring him to the new chapel which he was building, and his desire that Sir Thomas should head the subscription-list in so good a cause, was easy enough. It might be difficult to say in what Mr. Pabsby’s strength lay, but it certainly was the case that the letter was so written as to defy neglect and almost to defy refusal. Such is the power of horse-leeches. Sir Thomas sent Mr. Pabsby a check for twenty pounds, and received Mr. Pabsby’s acknowledgment, thanking him for his “first” subscription. The thanks were not very cordial, and it was evident that Mr. Pabsby had expected a good deal more than twenty pounds in return for all that he had done.

Mr. Pabsby was simply the first. Before Christmas had come, it seemed to Sir Thomas that there

“And that’s the kind of man you are, is it?”—Chapter XXXVI.

was not a place of divine worship in the whole of Percycross that was not falling to the ground in ruins. He had not observed it when he was there, but now it appeared that funds were wanted for almost every such edifice in the borough. And the schools were in a most destitute condition. He was informed that the sitting member had always subscribed to all the schools, and that if he did not continue such subscription the children would literally be robbed of their education. One gentleman, whose name he did not even remember to have heard, simply suggested to him that he would, as a matter of course, continue to give "the fifty pounds" toward the general Christmas collection on behalf of the old women of the borough. The sitting members had given it time out of mind. Mr. Roodilands had a political project of his own, which, in fact, if carried out, would amount to a prohibition on the import of French boots, and suggested that Sir Thomas should bring in a bill to that effect on the meeting of Parliament. If Sir Thomas would not object to the trouble of visiting Amiens, Lille, Beauvais, and three or four other French towns which Mr. Roodilands mentioned, he would be able to ascertain how much injury had been done to Percycross by the Cobden treaty. Mr. Spiveycomb had his own ideas about Italian rags—Mr. Spiveycomb being in the paper line—and wrote a very long letter to Sir Thomas, praying the member to make himself master of a subject so vitally important to the borough which he represented. Mr. Spicer also communicated to him the astounding fact that some high official connected with the army was undoubtedly misbehaving himself in regard to mustard for the troops. The mustard contracts were not open as they should be open. The mustard was all supplied by a London house, and Mr. Spicer was very anxious that Sir Thomas should move for a committee to inquire of the members of that London firm as to the manner in which the contracts were obtained by them. Mr. Spicer was disposed to think that this was the most important matter that would be brought forward in the next session of Parliament.

Mr. Pabsby had got his check before the other applications were received; but when they came in shoals, Sir Thomas thought that it might be well to refer them to Mr. Trigger for advice. Sir Thomas had not loved Griffenbottom during the election, and was not inclined to ask his colleague for counsel. Griffenbottom had obtained a name for liberality in Percycross, and had shown symptoms—so thought Sir Thomas—of an intention to use his reputation as a means of throwing off further burdens from his own shoulders. "I have spent a treasure in the borough. Let my colleague begin now." Words spoken by Mr. Griffenbottom in that strain had been repeated to Sir Thomas; and, after many such words, Sir Thomas could not go to Mr. Griffenbottom for advice as to what he should give, or refuse to give. He doubted whether better reliance could be placed on Mr. Trigger—but to some one he must go for direction.

Were he once to let it be known in Percycross that demands made would be satisfied, he might sign checks to the extent of his whole fortune, during his first session. He did write to Mr. Trigger, enclosing the various Percycross applications; and Mr. Trigger duly replied to him. Mr. Trigger regretted that money had been given to Mr. Pabsby. Mr. Pabsby had been of no use, and could be of no use. Mr. Griffenbottom, who knew the borough better than any one else, had understood this well when on one occasion he had been "a little short" with Mr. Pabsby. Sir Thomas ought not to have sent that check to Mr. Pabsby. The sending it would do infinite harm, and cause dissensions in the borough, which might require a considerable expenditure to set right. As to the other clerical demands, it seemed to Sir Thomas that Mr. Trigger was of opinion that they should all be gratified. He had, in fact, sent his money to the only person in Percycross who ought not to have received money. The fifty pounds for the old women was a matter of course, and would not be grudged, as it was the only payment which was absolutely annual. In regard to the schools, Sir Thomas could do what he pleased; but the sitting members had always been liberal to the schools. Schools were things to which sitting members were, no doubt, expected to subscribe. As to the question of French boots, Mr. Trigger thought that there was something in it, and said that if Sir Thomas could devote his Christmas holidays to getting up the subject in Lille and Amiens, it would have a good effect in the borough, and show that he was in earnest. This might be the more desirable, as there was no knowing as yet what might be done about the petition. There no doubt was a strong feeling in the borough as to the Cobden treaty, and Sir Thomas would probably feel it to be his duty to get the question up. In regard to the mustard, Mr. Trigger suggested that, though there was probably nothing in it, it might be as well to ask the Secretary at War a question or two on the subject. Mr. Spicer was, no doubt, a moving man in Percycross. Sir Thomas could at any rate promise that he would ask such questions, as Mr. Spicer certainly had friends who might be conducive to the withdrawal of the petition. Sir Thomas could at any rate put himself into correspondence with the War Office. Mr. Trigger also thought that Sir Thomas might judiciously study the subject of Italian rags, in reference to the great paper-trade of the country. No doubt the manufacture of paper was a growing business at Percycross. Mr. Trigger returned all the applications, and ended his letter by hinting that the checks might as well be sent at once. Mr. Trigger thought that "a little money about the borough" would do good at the present moment.

It need hardly be said that this view of things was not pleasant to the sitting member, who was still confined to his house at Fulham by an arm broken in the cause. Sir Thomas had at once sent the fifty pounds toward the Christmas festivities for the poor

of the borough, and had declared his purpose of considering the other matters. Then had come a further letter from Mr. Trigger, announcing his journey to London, and Mr. Trigger and Sir Thomas had their first meeting after the election, immediately upon Mr. Neefit's departure from the chambers. "And is it to be?" asked Stemm, as soon as he had closed the door behind Mr. Trigger's back.

"Is what to be?"

"Them petitions, Sir Thomas? Petitions costs a deal of money, they tell me, Sir Thomas." Sir Thomas winced. "I suppose you must go on now as your hand is in," continued Stemm.

"I don't know that at all," said Sir Thomas.

"You'll find as you must. There ain't no way out of it; not now, as you are the sitting member."

"I am not going to ruin myself, Stemm, for the sake of a seat in Parliament."

"I don't know how that may be, Sir Thomas. I hope not, Sir Thomas. But I don't see how you're not to go on now, Sir Thomas. If it wasn't for petitions, one wouldn't mind."

"There must be petitions, of course; and if there be good cause for them, they should succeed."

"No doubt, Sir Thomas. They say the bribery at Percycross was tremendous—but I suppose it was on the other side."

"If it was on our side, Stemm, it was not so with my knowledge. I did all I could to prevent it. I spoke against it whenever I opened my mouth. I would not have given a shilling for a single vote, though it would have got me the election."

"But they were not all that way, Sir Thomas—was they?"

"How can I tell? No—I know that they were not. I fear they were not. I cannot say that money was given, but I fear it."

"You must go on now, Sir Thomas, any way," said Stemm, with a groan that was not reassuring.

"I wish I had never heard the name of Percycross," said Sir Thomas.

"I dare say," replied Stemm.

"I went there determined to keep my hands clean."

"When one puts one's hand into other people's business, they won't come out clean," said the judicious Stemm. "But you must go on with it now, any way, Sir Thomas."

"I don't know what I shall do," said the unhappy member.

On the next morning there came another application from Percycross. The postmaster in that town had died suddenly, and the competitors for the situation, which was worth about one hundred and fifty pounds per annum, were very numerous. There was a certain Mr. O'Blather, only known in Percycross as cousin to one Mrs. Givantake, the wife of a Liberal solicitor in the borough. Of Mr. O'Blather the worst that could be said was that at the age of forty he had no income on which to support himself. Mrs. Givantake was attached to her cousin, and Mr. Givantake

had become sensible of a burden. That the vacant office was just the thing for him appeared at a glance to all his friends. Mrs. Givantake, in her energy on the subject, expressed an opinion that the whole cabinet should be impeached if the just claims of Mr. O'Blather were not conceded. But it was felt that the justice of the claims would not prevail without personal interest. The Liberal party was in power, and application, hot and instant, was made to Mr. Westmacott. Mr. Westmacott was happy enough to have his answer ready. The treasury had nothing to do with the matter. It was a post-office concern; and he, simply as the late Liberal member, and last Liberal candidate for the borough, was not entitled to intrude, even in a matter of patronage, upon the Postmaster-General, with whom he was not acquainted. But Mr. Westmacott was malicious as well as secure. He added a postscript to his letter, in which he said that he believed the present sitting member, Sir Thomas Underwood, was intimately acquainted with the noble lord who presided at the post-office. There were various interests at Percycross moved, brought together, weighed against each other, and balanced to a grain, and finally dovetailed. If Sir Thomas Underwood would prevail on Lord — to appoint Mr. O'Blather to the vacant office, then all the Givantake influence at Percycross should be used toward the withdrawal of the petition. Such was the communication now made to Sir Thomas by a gentleman who signed his name as Peter Piper, and who professed himself authorized to act on behalf of Mr. Givantake. Sir Thomas's answer was as follows:

"SOUTHAMPTON BUILDING, December 21, 186—.

"SIR: I can have nothing to do with Mr. O'Blather and the post-office at Percycross.

"I am

"Your obedient servant,

"THOMAS UNDERWOOD.

"MR. PETER PIPER, Post-office, Percycross."

Christmas had passed—and had passed uncomfortably enough at Popham Villa, in which retreat neither of the three young ladies was at present very happy—when Sir Thomas was invited by Mr. Trigger to take further steps with reference to the petitions. It was thought necessary that there should be a meeting in the Conservative interest, and it was suggested that this meeting should take place in Sir Thomas's chambers. Mr. Trigger, in making the proposition, seemed to imply that a great favor was thereby conferred on Sir Thomas—as that country is supposed to be the most honored which is selected as the meeting-ground for plenipotentiaries when some important international point requires to be settled. Sir Thomas could not see the arrangement in that light, and would have shuffled out of the honor had it been possible. But it was not possible. At this period of the year Mr. Griffenbottom had no house in town, and Mr. Trigger explained that it was inexpedient that such meetings should take place at hotels. There was no place so fitting as a lawyer's

chambers. Sir Thomas, who regarded as a desecration the entrance of one such man as Mr. Trigger into his private room, and who was particularly anxious not to fall into any intimacy with Mr. Griffenbottom, was driven to consent, and at one o'clock on the 29th, Stemm was forced to admit the deputation. The deputation from Percycross consisted of Mr. Trigger, Mr. Spicer, and Mr. Pile; but with them came also the senior sitting member. At first they were all very grave, and Sir Thomas asked them, indiscreetly, whether they would take a glass of sherry. Pile and Spicer immediately acceded to this proposition, and sherry was perhaps efficacious in bringing about speedy conversation.

"Well, Underwood," said Mr. Griffenbottom, "it seems that after all we are to have these d— petitions."

Sir Thomas lifted his left foot on his right knee, and nursed his leg—but said nothing. On one point he was resolved. Nothing on earth should induce him to call his colleague Griffenbottom.

"No doubt about that, Mr. Griffenbottom," said Mr. Pile, "—that is, unless we can make Westmacott right. 'Tother chap wouldn't be of much account."

"Mr. Pile, you're going a little too fast," said Trigger.

"No, I ain't," said Mr. Pile. But for the moment he allowed himself to be silenced.

"We don't like the looks of it at Percycross," said Mr. Spicer.

"And why don't we like the looks of it?" asked Sir Thomas.

"I don't know what your idea of pleasure is," said Mr. Griffenbottom, "but I don't take delight in spending money for nothing. I have spent enough, I can tell you, and I don't mean to spend much more. My seat was as safe as the church."

"But they have petitioned against that as well as mine," said Sir Thomas.

"Yes—they have. And now what's to be done?"

"I don't know whether Sir Thomas is willing to take the whole cost of the defence upon himself," said Mr. Trigger, pouring out for himself a second glass of sherry.

"No, I am not," said Sir Thomas. Whereupon there was a pause, during which Pile and Spicer also took second glasses of sherry.

"Why should I pay the cost of defending Mr. Griffenbottom's seat?"

"Why should I pay it?" said Griffenbottom. "My seat was safe enough. The fact is, if money was paid—as to which I know nothing—it was paid to get the second seat. Everybody knows that. Why should any one have paid money for me? I was safe. I never had any difficulty; everybody knows that. I could come in for Percycross twenty times running, without buying a vote. Isn't that true, Trigger?"

"I believe you could, Mr. Griffenbottom."

"Of course I could. Look here, Underwood—"

"I beg your pardon for one moment, Mr. Griffenbottom," said Sir Thomas. "Will you tell me, Mr. Trigger, whether votes were bought on my behalf?" Mr. Trigger smiled, and put his head on one side, but made no answer. "I wish I might be allowed to hear the truth," continued Sir Thomas. Whereupon Spicer grinned, and Mr. Pile looked as though he were about to be sick. How was it that a set of gentlemen, who generally knew their business so well as did the political leaders at Percycross, had got themselves into the same boat with a man silly enough to ask such a question as that?

"I shan't spend money," said Griffenbottom; "it's out of the question. They can't touch me. I've spent my money, and got my article. If others want the article, they must spend theirs."

Mr. Trigger thought it might be as well to

change the subject for a moment, or, at any rate, to pass on to another clause of the same bill.

"I was very sorry, Sir Thomas," said he, "that you wrote that letter to Mr. Givantake."

"I wrote no letter to Mr. Givantake. A man named Piper addressed me."

"Well, well, well; that's the same thing. It was Givantake, though of course he isn't going to sign his name to every thing. If you could just have written a line to your friend the Postmaster-General, I really think we could have squared it all."

"I wouldn't have made a request so improper for all Percycross," said Sir Thomas.

"Patronage is open to everybody," suggested Mr. Griffenbottom.

"Those sort of favors are asked every day," said Trigger.

"We live in a free country," said Spicer.

"Givantake is a d— scoundrel all the same," said Mr. Pile; "and as for his wife's Irish cousin, I should be very sorry to leave my letters in his hands."

"It wouldn't have come off, Mr. Pile," said Trigger, "but the request might have been made. If Sir Thomas will allow me to say as much, the request ought to have been made."

"I will allow nothing of the kind, Mr. Trigger," said Sir Thomas, with an assumption of personal dignity which caused every one in the room to alter his position in his chair. "I understand these things are given by merit." Mr. Trigger smiled, and Mr. Griffenbottom laughed outright. "At any rate, they ought to be, and in this office I believe they are." Mr. Griffenbottom, who had had the bestowal of some local patronage, laughed again.

"The thing is over now, at any rate," said Mr. Trigger.

"I saw Givantake yesterday," said Spicer.

"He won't stir a finger now."

"He never would have stirred a finger," said Mr. Pile; "and if he'd stirred both his fistfists, he wouldn't have done a ha'porth of good. Givantake, indeed! He be blowed!" There was a species of honesty about Mr. Pile which almost endeared him to Sir Thomas.

"Something must be settled," said Trigger.

"I thought you'd got a proposition to make," said Spicer.

"Well, Sir Thomas," began Mr. Trigger, as it were girding his loins for the task before him, "we think that your seat wouldn't stand the brunt. We've been putting two and two together and that's what we think." A very black cloud came over the brow of Sir Thomas Underwood, but at the moment he said nothing. "Of course it can be defended. If you choose to fight the battle you can defend it. It will cost about one thousand five hundred pounds, or perhaps a little more. That is, the two sides, for both will have to be paid." Mr. Trigger paused again, but still Sir Thomas said not a word. "Mr. Griffenbottom thinks that he should not be asked to take any part of this cost."

"Not a shilling," said Mr. Griffenbottom.

"Well," continued Mr. Trigger, "that being the case, of course we have got to see what will be our best plan of action. I suppose, Sir Thomas, you are not altogether indifferent about the money."

"By no means," said Sir Thomas.

"I don't know who is. Money is money all the world over."

"You may say that," put in Mr. Spicer.

"Just let me go on for a moment, Mr. Spicer, till I make this thing clear to Sir Thomas. That's how we stand at present. It will cost us—that is to say you, about fifteen hundred pounds, and we should do no good. I really don't think we should do any good.

Here are these judges, and you know that new brooms sweep clean. I suppose we may allow that there was a little money spent somewhere. They do say now that a glass of beer would lose a seat."

Sir Thomas could not but remember all that he had said to prevent there being even a glass of beer, and the way in which he had been treated by all the party in that matter, because he had so endeavored. But it was useless to refer to all that at the present moment. "It seems to me," he said, "that if one seat be vacated, both must be vacated."

"It doesn't follow at all," said Mr. Griffenbottom.

"Allow me just for a moment longer," continued Trigger, who rose from his seat as he came to the real gist of his speech. "A proposition has been made to us, Sir Thomas, and I am able to say that it is one which may be trusted. Of course our chief anxiety is for the party. You feel that, Sir Thomas, of course." Sir Thomas would not condescend to make any reply to this. "Now the Liberals will be content with one seat. If we go on it will lead to disfranchising the borough, and we none of us want that. It would be no satisfaction to you, Sir Thomas, to be the means of robbing the borough of its privilege after all that the borough has done for you."

"Go on, Mr. Trigger," said Sir Thomas.

"The Liberals only want one seat. If you'll undertake to accept the hundreds, the petition will be withdrawn, and Mr. Westmacott will come forward again. In that case we shouldn't oppose. Now, Sir Thomas, you know what the borough thinks will be the best course for all of us to pursue."

Sir Thomas did know. We may say that he had known for some minutes past. He had perceived what was coming, and various recollections had floated across his mind. He especially remembered that fifty pounds for the poor old women which Mr. Trigger only a week since had recommended that he should give—and he remembered also that he had given it. He recollected the sum which he had already paid for his election expenses, as to which Mr. Trigger had been very careful to get the money before this new proposition was made. He remembered Mr. Pabsby and his check for twenty pounds. He remembered his broken arm, and that fortnight of labor and infinite vexation in the borough. He remembered all his hopes, and his girls' triumph. But he remembered also that he had told himself a dozen times since his return that he wished that he might rid himself altogether of Percycross and the seat in Parliament. Now a proposition that would have this effect was made to him.

"Well, Sir Thomas, what do you think of it?" asked Mr. Trigger.

Sir Thomas required the passing of a few moments that he might think of it, and yet there was a feeling strong at his heart telling him that it behooved him not even to seem to doubt. He was a man not deficient in spirit when roused as he now was roused. He knew that he was being ill used. From the first moment of his entering Percycross he had felt that the place was not fit for him, that it required a method of canvassing of which he was not only ignorant, but desirous to remain ignorant—that at Percycross he would only be a cat's-paw in the hands of other men. He knew that he could not safely get into the same boat with Mr. Griffenbottom, or trust himself to the steering of such a coxswain as Mr. Trigger. He had found that there could be no sympathy between himself and any one of those who constituted his own party in the borough. And yet he had persevered. He had persevered because in such matters it is so difficult to choose the moment in which to recede. He had persevered—and had attained

a measure of success. As far as it had been possible for him to do so, he had fought his battle with clean hands, and now he was member of Parliament for Percycross. Let what end there might come to this petition—even though his seat should be taken from him—he could be subjected to no personal disgrace. He could himself give evidence, the truth of which no judge in the land would doubt, as to the purity of his own intentions, and as to the struggle to be pure which he had made. And now they asked him to give way in order that Mr. Griffenbottom might keep his seat!

He felt that he and poor Moggs had been fools together. At this moment there came upon him a reflection that such men as he and Moggs were unable to open their mouths in such a borough as Percycross without having their teeth picked out of their jaws. He remembered well poor Moggs's legend, "Moggs, Purity, and the Rights of Labor;" and he remembered thinking at the time that neither Moggs nor he should have come to Percycross. And now he was told of all that the borough had done for him, and was requested to show his gratitude by giving up his seat—in order that Griffenbottom might still be a member of Parliament, and that Percycross might not be disfranchised! Did he feel any gratitude to Percycross or any love to Mr. Griffenbottom? In his heart he desired that Mr. Griffenbottom might be made to retire into private life, and he knew that it would be well that the borough should be disfranchised.

These horrid men that sat around him—how he hated them! He could get rid of them now, now and forever, by acceding to the proposition made to him. And he thought that in doing so he could speak a few words which would be very agreeable to him in the speaking. And then all that Mr. Trigger had said about the fifteen hundred pounds had been doubtless true. If he defended his seat, money must be spent, and he did not know how far he might be able to compel Mr. Griffenbottom to share the expense. He was not so rich but what he was bound to think of the money, for his children's sake. And he did believe Mr. Trigger, when Mr. Trigger told him that the seat could not be saved.

Yet he could not bring himself to let these men have their way with him. To have to confess that he had been their tool went so much against the grain with him that any thing seemed to him to be preferable to that. The passage across his brain of all these thoughts had not required many seconds, and his guests seemed to acknowledge by their silence that some little space of time should be allowed to him. Mr. Pile was leaning forward on his stick, with his eyes fixed upon Sir Thomas's face. Mr. Spicer was amusing himself with a third glass of sherry. Mr. Griffenbottom had assumed a look of absolute indifference, and was sitting with his eyes fixed upon the ceiling. Mr. Trigger, with a pleasant smile on his face, was leaning back in his chair with his hands in his trousers-pockets. He had done his disagreeable job of work, and upon the whole he thought that he had done it well.

"I shall do nothing of the kind," said Sir Thomas, at last.

"You'll be wrong, Sir Thomas," said Mr. Trigger.

"You'll disfranchise the borough," said Mr. Spicer.

"You'll not be able to keep your seat," said Mr. Trigger.

"And there'll be all the money to pay," said Mr. Spicer.

"Sir Thomas don't mind that," said Mr. Griffenbottom.

"As for paying the money, I do mind it very much," said Sir Thomas. "As for dis-

franchising the borough, I cannot say that I regard it in the least. As to your seat, Mr. Griffenbottom—"

"My seat is quite safe," said the senior member.

"As to your seat, which I am well aware must be jeopardized if mine be in jeopardy, it would have been matter of more regret to me, had I experienced from you any similar sympathy for myself. As it is, it seems that each of us is to do the best he can for himself, and I shall do the best I can for myself. Good-morning."

"What, then, do you mean to do?" said Mr. Trigger.

"On that matter I shall prefer to converse with my friends."

"You mean," said Mr. Trigger, "that you will put it into other hands."

"You have made a proposition to me, Mr. Trigger, and I have given you my answer. I have nothing else to say. What steps I may take I do not even know at present."

"You will let us hear from you," said Mr. Trigger.

"I cannot say that I will."

"This comes of bringing a gentleman learned in the law down into the borough," said Mr. Griffenbottom.

"Gentlemen, I must ask you to leave me," said Sir Thomas, rising from his chair and ringing the bell.

"Look here, Sir Thomas Underwood," said Mr. Griffenbottom. "This to me is a very important matter."

"And to me also," said Sir Thomas.

"I do not know any thing about that. Like a good many others, you may like to have a seat in Parliament, and may like to get it without any trouble and without any money. I have sat for Percycross many years, and have spent a treasure, and have worked myself off my legs. I don't know that I care much for any thing except for keeping my place in the House. The House is every thing—meat and drink; employment and recreation; and I can tell you I'm not going to lose my seat if I can help it. You came in for the second chance, Sir Thomas; and a very good second chance it was if you'd just have allowed others who knew what they were about to manage matters for you. That chance is over now, and, according to all rules that ever I heard of in such matters, you ought to surrender.—Isn't that so, Mr. Trigger?"

"Certainly, Mr. Griffenbottom, according to my ideas," said Mr. Trigger.

"That's about it," said Mr. Spicer.

Sir Thomas was still standing. Indeed, they were all standing now. "Mr. Griffenbottom," he said, "I have nothing further that I can say at the present moment. To the offer made to me by Mr. Trigger I at present positively decline to accede. I look upon that offer as unfriendly, and can therefore only wish you a good-morning."

"Unfriendly," said Mr. Griffenbottom, with a sneer.

"Good-by, Sir Thomas," said Mr. Pile, putting out his hand. Sir Thomas shook hands with Mr. Pile cordially. "It's my opinion that he's right," said Mr. Pile. "I don't like his notions, but I do like his pluck. Good-by, Sir Thomas." Then Mr. Pile led the way out of the room, and the others followed him.

"Oh!" said Stemm, as soon as he had shut the door behind their backs. "That's a deputation from Percycross, is it—Sir Thomas? You were saying as how you didn't quite approve of the Percycrossians." To this, however, Sir Thomas vouchsafed no reply.

APPLETONS' JOURNAL

LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 94.—VOL. V.]

SATURDAY, JANUARY 14, 1871.

[PRICE TEN CENTS.]

EGYPTIAN RUINS.

WE present to our readers, in this number of the JOURNAL, a series of illustrations of Egyptian ruins, engraved from very superior photographs made by Dr. Vogel, of the Berlin University, for the Prussian Government, and never before published.

The first represents the magnificent and famous temple of Den-

but there is a smaller one, whose soft, voluptuous outline is still sufficient evidence of the justness of her renown. The profile is exquisitely beautiful. The forehead and nose approach the Greek standard, but the mouth is more roundly and delicately curved, and the chin and cheek are fuller.

TEMPLE OF DENDERA.

dera, in Upper Egypt, near the left bank of the Nile, one of the best-preserved and most perfect specimens of Egyptian architecture. It was dedicated to the goddess Athor, the Egyptian Venus, and was probably built in the times of the Ptolemies, two or three hundred years before Christ. Part of the temple was built by Cleopatra, whose portrait, with that of her son Cæsarion, may still be seen on the exterior wall. The face of her colossal image has been nearly destroyed;

In the pronaos, or on the front of the temple, may also be distinguished the names of Augustus, Caligula, Claudius, and Nero. The cornice bears an inscription in Greek, setting forth that the portico was added to the temple in the reign of Tiberius Cæsar, in honor of the goddess Aphrodite. On the ceiling of the portico is the famous zodiac discovered in 1799 by the French *savants* under Bonaparte, which was rashly considered to prove, by the precession of the equi-

ROOF OF THE TEMPLE OF DENDERA.

noxes, its own date to be from fifteen to seventeen thousand years B. C. All scholars are now agreed that it is not older than the Ptolemies.

The sight of this temple produced a profound impression on the French *savants*. One of the military officers of the expedition said to Denon: "What I have seen this day has repaid me for all my fatigues; whatever happens to me now in Egypt, I shall all my life congratulate myself at having embarked in the expedition, to have obtained the remembrance of this day, which I shall preserve all the rest of my existence."

Denon himself says, in his "Narrative:" "I wish that I could here transfuse into the soul of my reader the sensations which I experienced. I was too much lost in astonishment to be capable of cool judgment; all that I had hitherto seen served here but to fix my admiration. This monument seemed to me to have the primitive character of a temple in the highest perfection. I felt that I was in the sanctuary of the arts and sciences. How many periods presented themselves

COLUMNS AT KARNAK.

to my imagination at the sight of such an edifice! How many ages of creative ingenuity were requisite to bring a nation to such a degree of perfection and sublimity in the arts! and how many more of oblivion to cause these mighty productions to be forgotten, and to bring back the human race to the state of Nature in which I found them on this very spot! Never was there a place which concentrated in a narrower compass the well-marked memorial of a progressive lapse of ages. What unceasing power, what riches, what abundance, what superfluity of means must a government possess which could erect such an edifice, and find within itself artists capable of conceiving and executing the design of decorating and enriching it with every thing that speaks to the eye and the understanding! Never did the labor of man show me the human race in such a splendid point of view; in the ruins of Dendera the Egyptians appeared to me giants."

The portico, which is seen in our view, is about a hundred feet in length, and is supported by six columns,

united by screens of masonry, no stone of which, or of the columns themselves, is unsculptured. It has the appearance, however, of not being sufficiently lofty to produce an impressive effect. This is owing to the fact that rubbish and drifting sands have accumulated to a great depth in front of the temple, so that the photograph could embrace only the upper part of the portico. "What was my astonishment," says Bayard Taylor, "on arriving at the entrance, to find that I had approached the temple on a level with half its height, and the pavement of the portico was as far below as the scrolls of its cornice were above me! The six columns I had seen, covered three other rows, of six each, all adorned with the most elaborate sculpture, and exhibiting traces of the brilliant coloring which they once possessed. The entire temple, which is in an excellent state of preservation, except where the hand of the Coptic Christian has defaced its sculptures, was cleaned out by order of Mehemet Ali.

"I find my pen at fault," continues Mr. Taylor, "when I attempt to describe the impression produced by this splendid portico. The twenty-four columns, each of which is sixty feet in height, and eight feet in diameter, crowded upon a surface of one hundred feet by seventy, are oppressive in their grandeur. The dim light, admitted through the half-closed front, which faces the north, spreads a mysterious gloom around these mighty shafts, crowned with the fourfold visage of Athor, still rebuking the impious hands that have marred her solemn beauty. On the walls, between columns of hieroglyphics and the cartouches of the Cæsars and the Ptolemies, appear the principal Egyptian deities—the rigid Osiris, the stately Isis, and the hawk-headed Orus. Around the bases of the columns spring the leaves of the sacred lotus, and the dark-blue ceiling is spangled with stars, between the wings of the divine emblem. The sculptures are all in raised relief, and there is no stone in the temple without them. I cannot explain to myself the unusual emotion I felt while contemplating this wonderful combination of a simple and sublime architectural style with the utmost elaboration of ornament. My blood pulsed fast and warm on my first view of the Roman Forum, but in Dendera I was so saddened and oppressed, that I scarcely dared speak for fear of betraying an unmanly weakness. Though such a mood was more

painful than agreeable, it required some effort to leave the place, and, after a stay of two hours, we still lingered in the portico and walked through the inner halls, under the spell of a fascination which we had hardly power to break."

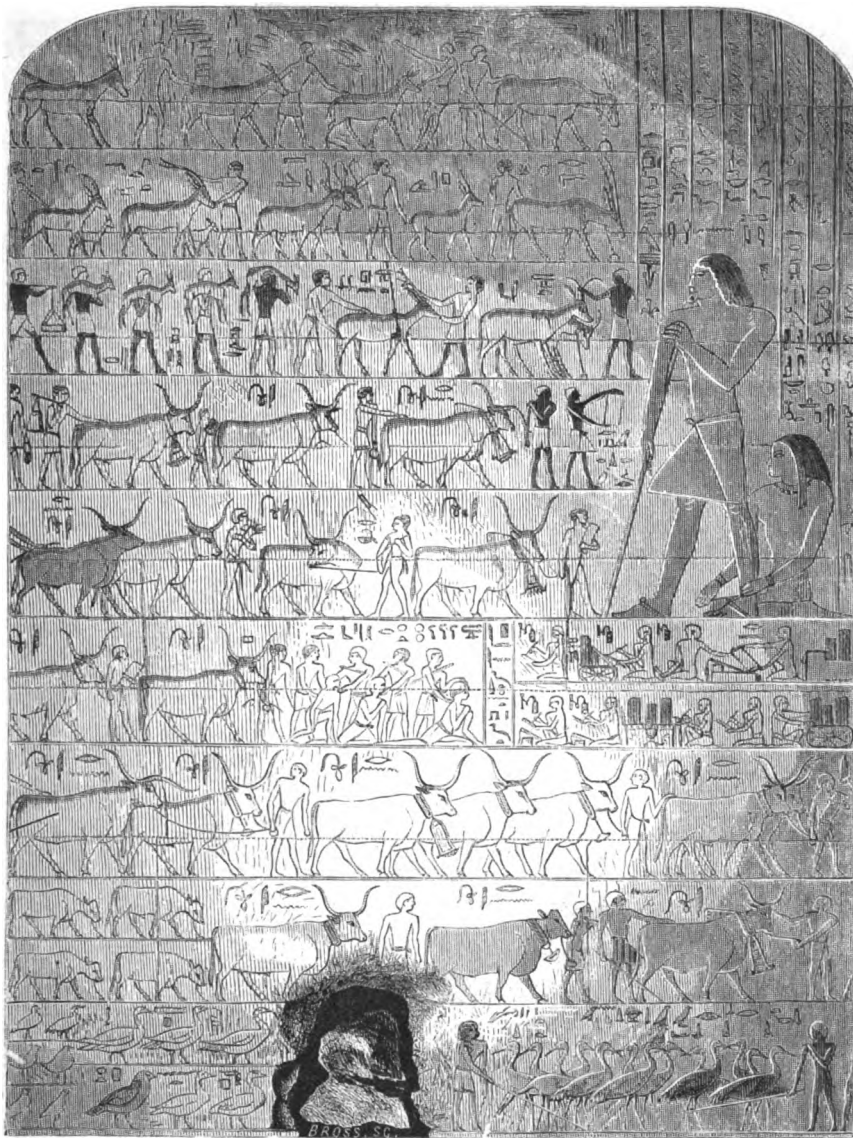

Our second view represents the roof of the temple of Dendera.

Our third illustration is of some columns in the great temple at Karnak, one of the remains of ancient Thebes. Some of these columns are twenty-six feet in circumference, and others thirty-four feet. Of the hundred columns of the porticos alone, the smallest are seven and a half feet in diameter, while the largest are twelve feet thick and eighty feet high. The main feature of the temple is a vast hall

crowded with these magnificent columns, one hundred and thirty-four in number, the central ones being sixty-six feet in height, exclusive of the pedestals and abacus. All these columns are covered with hieroglyphics, and surmounted by capitals, richly painted, and all of different patterns.—We have not space for further details of this marvellous pile, which is beyond comparison the grandest architectural work ever reared on earth. It is nearly two miles in circumference, and the walls are eighty feet high and twenty-five feet thick.

Our fourth illustration represents part of a wall in a tomb at Sak-kara, on the site of ancient Memphis. It is covered with hieroglyphics, and the photograph was taken with sunlight reflected by mirrors.

Our fifth illustration gives a view of the ruin called, by the Arabs, the Castle of Pharaoh, at Medeenet Abou, on the site of Thebes, and on the western bank of

PART OF A WALL IN A TOMB AT SAKKARA.

the Nile. The view embraces the plain on which are seen the two famous colossal statues, known to the Arabs as Shamy and Damy, and to the Greeks and Romans by the name of Memnon. These immense sitting figures rise fifty-three feet above the ground, which has buried their pedestals, overlook the site of vanished Thebes, and assert the grandeur of which they and Karnak are the most striking remains. They were erected by Amunoph III., and, though the faces are totally disfigured, the full, round, beautiful proportions of the colossal arms, shoulders, and thighs, do not belie the marvellous sweetness of the features of his portrait in his tomb. The ancients believed that one of these statues always saluted the rising sun with a sound like that of a harp-string. Modern research has

CASTLE OF PHARAOH.

fully explained this beautiful story. There is a certain stone on Memnon's lap, which, when sharply struck, gives out a clear, metallic ring. Behind it is a small square aperture, invisible from below, where one of the priests no doubt stationed himself to perform the daily miracle. Memnon now sounds at all hours of the day, at the command of all travellers who will pay an Arab to climb into the lap of the statue and strike the metallic stone.

These statues are about forty feet apart, and between them ran an avenue leading to a temple. This avenue was evidently bordered by other colossal figures, the remains of some of which are still visible. The temple, whose

VALLEY OF DER EL BAHRE.

approach they were intended to guard was uncovered half a century ago, when many sphinxes were found with the lion's head on the body of a human female. The foundation and columns of a magnificent building were also found. Belzoni dug up here a handsome statue of black granite, which is now in the British Museum. All the indications showed, in fact, that the Memnon had belonged to an edifice not inferior, probably, even to the sublime structures of Luxor and Karnac on the opposite side of the Nile.

Our sixth and last view presents a scene in the valley of Der el Bahre, in the Libyan Desert, on the west side of Thebes.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER II.

"On, I'd so much rather not!" was spoken with a startled face, and with an ashamed consciousness of the absurdity of the words, which, nevertheless, were at the moment the only words she could find to say.

Daisy was sitting by the fire, in the between-lights hour, in a small but very pretty drawing-room; sitting in a low chair, her little feet warming themselves cosily. She was again dressed in black, but the black was now worn for one whom she had loved and served, and the mourning for whom had softened her face to a tender seriousness rather than sorrow.

From the time, now eighteen months ago, when she first saw the frail invalid, whose dying days she had solaced, she had led that unselfed life which, more than any other, deadens and keeps under personal perplexities and troubles. Each morning she had wakened to give all the day to her dying friend; each night she had lain on the watch for her, only sleeping when she slept. No more wholesome life could have been found for Daisy.

But now Daisy's friend was some weeks dead. Daisy's occupation was gone.

"So much rather not!" she repeated. She had spoken the first time, looking straight before her into the fire. This time she turned to look round, and up, at some one standing half behind her, the earnestness of startled appeal that was in her face, as she did so, causing this some one a grim kind of amusement.

How pretty she looked, he was thinking, the firelight glancing on the soft round throat that rose from the black bodice, and shining on the small white hands clasped on her knee. The chair she sat in being very low, and he being rather tall, her head had to be thrown far back before her eyes could meet his. They did this only for a flash, and were then again averted.

"Much rather not!" What sort of an answer is that to give a man to such a question? And, pray, why would you 'so much rather not'?"

"Because, well, because I would so much rather not! Because I'm so tired, and because any thing new, any great change, would be . . . would be. Oh, Kenneth, you know I never could express myself properly."

"Would be—what?"

"So troublesome."

"So troublesome!"

"It is rude and unkind of you to laugh at me."

"But, Daisy, you want laughing at, you want well laughing at. You ought to be laughed out of such childish or old-maidish ideas."

"And if I am old-maidish," she said, her face flushed vividly with annoyance at the term, he thought, "I'd rather remain so; I'd so much rather remain just as I am. Kenneth, dear Kenneth, if you please, don't trouble me. Don't be angry with me, just let me remain as I am."

The poor little coward dreaded agitation, with a physical and a mental dread; she dreaded love, she dreaded joy, dreaded every thing likely to stir her heart and her life out of its brief quiet.

"Don't trouble you," he very uncourteously again echoed her words. "And wouldn't you take a little 'trouble' to make me happy, Daisy? If not, I've been much mistaken in Daisy. Do you think trouble the worst thing in the world, and comfort the best? If so, you are not my Daisy, but some lazy, spoilt little woman. What is the meaning of it all, Daisy?"

She struggled with herself a moment, struggled for the power to speak lightly. Then she said:

"I will answer you in the words of my favorite, Sir Dinadan, King Arthur's only lady-less knight, you know, who says 'The joy of love is too short, and the sorrow there-of, and what cometh there-of dureth over-long.'"

"You have been studying in a bad school."

"I will quote from another master, then. It is Chaucer who says:

For love is yet the moste stormy lyf,
Right of himself, that ever was begunne,
For ever some mystrust, or nice stryf,
Ther is in love, some cloudis in that sunne."

Her friend considered her carefully while she spoke, and, after she had spoken, kept silent. He was conscious of a curious thrill of some

sort of passion through her attempt at light playfulness, and he called to mind (it was not strikingly visible now by the firelight) how, once or twice, he had been pained by the look of careworn age that would creep over the childish, soft face.

This silence of his troubled Daisy; she was more afraid of it than of any such speech as had, as yet, been between them.

"If you knew," she said, "how happy these last months have been to me, and how I needed the rest their peace has given me, you, who are so good, so unselfish, would not ask me to think of any change."

"Is all the unselfishness to be on my side, Daisy?"

"But you, too, have seemed very happy."

"No, not that. I have been pleasing myself with the hope that I was about to be very happy."

At this moment a servant brought in the lamp. She shut out the twilight, and muffled a thrush's song by closing shutters and drawing curtains.

Daisy immediately rose from her low chair by the fire, and, seating herself at the table, took up her work, to which she devoted herself with a spasmodic sort of energy.

In her fear of silence she began to talk, as she worked, of any thing so that it was nothing, and safe to lead to nothing—of the lateness and the coldness of this year's early spring; but of how, now, at last, that cold seemed over, and every thing was budding and blooming miraculously.

To all she said, Mr. Stewart answered not a word, and, by-and-by, Daisy came to a discomforted pause. Then he spoke, meditatively:

"It is strange to think, Daisy, that there are two or three years of your life of which I know absolutely nothing. I, who, up to the time of my going to India to fetch home poor Lily and her children, saw you every day, knew how every hour of your day was spent, almost."

"What should there be to know of any years of such a life as mine?"

"That is it. What should there be to know of any years of such a quiet, lonely, innocent life? This is how I fill in those years; just tell me if I do so rightly."

Involuntarily Daisy stayed the movement of her busy hand; she held her breath, and felt as if she would like to stay the beating of her heart.

"After the accident through which you lost Wattie—some day, Daisy, you must tell me more exactly how that was—your old home grew too painfully distasteful to you; you went to stay with your good nurse, who had then lately married; from there you answered the call of your cousin. But you must have paid 'nurse' (I don't know that you have told me her present name, or where she lives) a long visit, Daisy?"

"She did not get tired of me."

"I suppose I may conclude that this was all."

"You haven't reckoned my surprise when my cousin brought me to Redcombe, your uncle's property. Your uncle's death and your coming home, his heir, are nothing in your history."

"Yes, they are a great deal in my history, but you don't hold them much in yours. Possibly you would have shunned Redcombe had you known that, coming here, you might soon have so 'troublesome' a neighbor."

"Possibly I should, Kenneth."

"So that was all!—And yet, Daisy," he went on, after a pause, "it seems to me that is not, cannot be, all—that there has been something more; something that has given you a look of careworn weariness, which you, who are so young, ought not to have; something that makes you speak the truth when you say—what you are always saying—that you are 'so tired.'"

There was a gloomy fold on his forehead now. He averted his eyes from her face and fixed them on the fire, as he began again:

"Daisy, there is one thing I have often wondered about, one thing I have often been on the point of asking you about, but was afraid—afraid my words might pain you, afraid they might touch some wound—"

"They would, they would; beyond what I could bear, they would pain me!" cried Daisy. "Wonder about nothing—ask me about nothing. Leave me alone; only leave me alone, dear Kenneth, leave me alone. You know I am a coward, and can't bear pain. Have pity!"

"Just one question: if you are not brave, I think you will bear a little pain to save me much—unless you are wholly altered from the

Daisy I knew and loved. Just one question. What has become of—"

"He is dead," gasped Daisy; "he died horribly, by his own hand."

"Good Heavens!" He turned and looked at her now; her face could not have been whiter, and her eyes were strained and dilated, as if that horror (which, as he supposed, she could only have seen in imagination) were reenacting before them.

"My poor, poor child! Why did you never tell me? If you had told me, then I should have understood every thing."

"Why did I never tell you!" she echoed, almost fiercely. "Was it a thing I was likely to speak of? Was it a thing I should recall if I could help? I had almost left off being haunted by the memory of it, and now, Kenneth, you cruel Kenneth, you have brought it all back."

"Forgive me, Daisy, and tell me, that I may never need to come near the subject again, just one or two things more. Did he—did you—"

But while he bungled, not knowing how most innocently to frame his question, Daisy sprang up, quivering.

"I cannot bear it! I cannot! How dare you torture me so? It is no use, I tell you I cannot bear it!" As she spoke, she moved toward the door.

"No, no, don't go away," he said, soothingly, following her, bringing her back to her chair. "If it is true you cannot bear it, I will never touch the matter again. But, Daisy, if you would only have a minute's courage and patience, it would be so much the happier way. If you would just tell the story out, and then come to me to weep your tears—"

"I will tell you nothing. And, what is more, you must promise not to question me again, ever. If you don't give me this promise, Kenneth, I shan't be able to bear to see you or to hear you speak."

"This is all terribly morbid, mere madness." He noted the wild trouble of her affrighted eyes, and hastened to add, "But you have my promise, Daisy. I need not say that I shall keep it. But some day you will release me from it—some day when our hearts are so close that there is room for nothing between them."

"You speak," she said, "as if—as if—you speak, I mean, as I have given you no right to speak."

"I own my presumption."

There was an interval of silence.

Mr. Stewart had thrown himself into Daisy's low chair, and sat looking into the fire with a baffled expression. Daisy worked away again with spasmodic energy.

Her heart had just begun to beat quietly once more, when Mr. Stewart came from the fireside, and took a chair at the little table just opposite her.

"Daisy, be so good as to put down your work, and listen to me."

"I can listen just as well while I work."

But he put his hand over hers, and held it still.

"Tyrant! I wish you had pricked yourself!"

"It's my heart, Daisy, and not my hand, of which you make a pin-cushion."

"That's nonsense, Kenneth."

"Of course that's nonsense, Daisy. I never supposed it would pass with you for any thing else. But now I'm going to talk sense, in sober seriousness. Daisy, I wish to have a wife."

"Well, Kenneth, I suppose that is quite natural."

"I think it is. I'm tired of being always alone—alone when I'm sad, alone when I'm gay, alone when I'm sick, alone when I'm well. I'm tired of it. It's dreary. I want a wife."

"Well, Kenneth, I'm sure I don't see any reason why you shouldn't have a wife. You're not too old to marry, or too ugly, or too poor. You're kind and good. You won't have any difficulty in finding a wife."

She kept her eyes fixed upon his hand, still overlying her hand. He could not see their expression, but he fancied a slight tremor in her voice when she said, "You're kind and good."

"But just 'a wife' would not satisfy me, Daisy."

"You surely don't mean you want more than one, Kenneth?"

"I mean, as you well know, Daisy, that I don't want just any one. In fact, there is in the world just one woman I want for my wife."

"If that is so, Kenneth, and she doesn't want to marry, or doesn't want to marry you, it's an unhappy thing for you; because, I suppose,

in that case, 'Want,' as used to be said to me when I was a child, 'must be your master.'"

"But, Daisy, she is such a tender, gentle, loving little woman, that I think she would take me out of pity, because I want her, if she once clearly understood how desperately I want her."

"That would be wicked in her, Kenneth, and miserable for you—if she didn't love you."

"But there it is, Daisy; there's the pity of it. I fancy she does love me—loves me as dearly as I could wish—but is letting her brain be overclouded by some absurd cobweb or other, which, if I can't get at it, to brush it away, may destroy both her happiness and mine."

Daisy, trying to keep up a jesting tone, murmured something of the vanity of men. Not heeding her, Mr. Stewart went on:

"That she loves no one better than she loves me, I, at least, feel sure. She has brown eyes, that look loving when they look into mine. She has soft, smooth, brown hair, that often tempts my hand to stroke it; and I hardly think, if it did so, she would be angry. She has the sweetest mouth in the world, with just one fault, that it doesn't smile often enough, though it looks as if meant to be always smiling. She has a dear little soft hand, that seems always glad to come into mine."

Daisy at last looked up at him, and there was a world of flitting, flying trouble in those eyes.

"It's no use to pretend I don't understand you, Kenneth; but, indeed, Kenneth it can't, can't, can't be. There are reasons of which you know nothing, of which you guess nothing, why it can't be. If only you'd let me alone; Kenneth, dear Kenneth, pray, pray leave me alone."

"But, Daisy, this sort of answer is too childish; it is ridiculous, dear, unworthy of you. Because, now a good while ago, and when you were little more than a child, you loved, or believed you loved, a man unworthy of love, is this to stand between you and love forever after? You say there are reasons of which I know, and can guess, nothing. But there cannot be, beyond some trifles, in themselves nothing, magnified by your morbidness: you are making mountains of mole-hills."

"Am I, Kenneth?" There was bitterness in her smile. "Would to Heaven I could think so! It is not love, or the memory of love, that stands between me and love; but something does stand between, and must all my lifetime. So, Kenneth, dear Kenneth, leave me in peace. I want nothing but quiet, of mind and body. The things I most honestly thank God for are darkness and sleep. The thing I fervently pray to Him for is, that He will let me forget. Kenneth, it would kill me to do what you wish. It can't, can't, can't be. I am not fit for you. Leave me in peace."

On his part a few minutes of frowning thoughtfulness. Then he returned to the charge.

"In all you say I can only see the outcome of a morbidly overgrown sensitiveness. What you call peace is not peace, but stagnation. As to forgetting, you will best forget by letting your life be filled with new things, new hope, and love. You are a woman, meant to find your happiness in loving, and in being loved, and in living for those you love, not in the selfish, lonely comfort and quiet of an old maid's life. Think how selfish all you have said has been. It is all of what you want, with no thought for me. I, too, want rest and peace. Till I know that one roof covers you and me, I shall not know either. In fact, Daisy, I so want you that my life is one want till I have you."

"Have pity, Kenneth; you torture me."

He looked straightly down into her appealing eyes, eyes that, even while they appealed, contracted as if with pain, and shrank from his scrutiny.

"I torture you, do I, poor Daisy? That is the last thing I would do, except for your good. Well; I have almost done. I will only ask you, just for one moment, to put yourself in my place. I want a wife, and you are the only woman I will marry. I want a home, not a house, but a home, and you are the only woman who can make one for me. Isn't my case a hard one, Daisy? Mightn't you make some sacrifice—of pride, or reserve, or whatever it is—for me? Look at me critically, Daisy. Don't I look as if it were time I had some comfort in life? See how gray I'm getting. See how bald I'm getting. Am I not thin and gaunt? Don't I look uncared for? Putting aside happiness, what even of comfort have I had in life? Think how cosy you are here, Daisy; and by-and-by you will turn me out into the raw night."

Listen to the rain. I shall be wet to the skin when I get home. There will be no fire to warm me, and nobody to notice whether I'm wet or dry."

"As if you cared for such things!" Daisy spoke, scornfully. She was irritated; she fancied there was a twinkle of humor about his mouth. It seemed as if what was such terrible tragedy to her was to him only comedy; as if he were either indifferent to success or very confident of it.

"I didn't say I did care for such things; but I thought you might care about them for me, Daisy. And, without caring about being cold and wet, I might get a chill, and die of it."

"You have only your own wilfulness to blame if you cannot have the common comforts of life. You often used to call me wilful, but it is you who are wilful now, saying you want a wife, and setting your mind upon a woman you can't have as the only one you will have."

"That is not wilfulness, Daisy; that is wisdom; besides, that I can't have you has yet to be proved."

"Oh, of course!" Daisy was glad to feel herself growing hot and angry. It was so much less painful to be angry with him than to be sorry for him.

"In a weak creature," he went on, "the determination to be satisfied with nothing but something it can't get would be mere wilfulness; but, Daisy, I am not weak, and I mean to get the one thing, that is, the one thing that can satisfy me."

Looking up into his eyes, Daisy flushed, and trembled, and quailed.

"Kenneth, Kenneth, don't say so!" she cried, piteously. "Oh, if only any thing I could say would make you give it up, and leave me in peace!"

"There are words that would do this. If you can look me full in the face and say, 'Kenneth, I don't love you. I never have loved you, I never shall love you,' then I will go away, and leave you in peace."

Instead, she bowed her face into her hands, murmuring something about his cruelty, and that she ought to hate him. Then, after a time, she looked up, to say, "But, Kenneth, it cannot be. I will not, I cannot, marry you. I am not fit for you."

"You have said those words, that you are not fit for me, several times. What do you mean by them?"

She made him no answer.

He began to walk to and fro in the room.

"There can be no middle course," he said, by-and-by. "If you insist in your determination to have nothing to do with me—"

She murmured she had expressed no such determination.

"Yes, you have. I want all or nothing. You refuse me all, so I will have nothing. I am not a fellow who can keep dangling on, on sufferance. Well, then, if you have given me my final answer, if I must take it as such, then it must be good-by, Daisy. I shall leave the neighborhood. If I were able I would stay near you, to watch over you at a distance (rather an Irish proceeding, but you know what I mean), but I am not able for that. I should not be able to keep away from you. I should be always annoying you."

"You never do annoy me, except when—"

"Except when I ask you to be my wife. I should never be able to see you without asking you, so I should be always annoying you. Besides, Daisy, there are other things I am bound to consider for you. This is a wicked and scandal-loving world. You live alone now, you have lost the protection of your poor cousin's presence. You live alone, and you are a young and pretty single woman. If you won't have me for your husband, you can't have me for your friend."

Her cheeks burnt with hot color; she answered him very meekly, "Very well, Kenneth, it must, of course, be as you think best."

If he had known the blank sense of desolation that fell upon her!

"Very well, Daisy," he mocked her angrily. "I've already pleaded, argued, and threatened, as much as I can. I did think you cared enough for me to set aside your cold-hearted, morbid, old-maidish scruples. As it is not so, this evening's good-night had better be good-by."

"Very well, Kenneth. Good-night—good-by."

"You wretched little unfeeling creature! What on earth could make me care for you as I always have done, as I always shall do?"

"What, indeed! I have often wondered."

"Good-night, Daisy, not good-by. I think I will see you once more."

"Good-night, Kenneth. I am glad you will see me once more."

He went away without touching her hand. She listened to his

step along the gravel, she heard the garden-gate swing-to, and latch itself after him, and then—

First she sat some moments with clasped hands, gazing straight out into the desolation of her life; then she laid her head on the table and cried as if she would cry that desolate life away—for how long she did not know. She was presently startled by a light touch on her hair. Then a voice said:

"Daisy! my poor little crushed flower! Have I hurt you so much? Did I tease you so cruelly? But you were cruel, too, Daisy."

She laid her cheek against his hand, and then she kissed his hand. She tried to speak, but a fresh burst of sobs choked back the words. He spoke soothingly and fondly. Once more she struggled to say something.

"It is that I—I— Oh, I am not what you think me! I—" Again the "climbing sorrow" in her throat made speech impossible, and what she had spoken had been barely audible. There came one despairing effort: "If only I were dead, and you knew all!" Then she laid her head down again and kept still.

"My poor Daisy! My poor Daisy!" A thoughtful pause. Then he said, "There can be nothing I don't know that really matters. Perhaps I can guess at a good deal, can understand how your innocent, over-sensitive heart reproaches you with treachery, because, perhaps, after I left you, you were entrapped, betrayed into what was not in harmony with the implied promise of your last words to me. You were a guileless child, Daisy, and could have been no match for your adversary. I am tempted to wish I had strangled the fellow before he crossed your path. I don't say that there is not much that painfully perplexes me. That you believed you loved him I can understand; few women could resist him, but that your love for him should so long linger that—"

"My love for him!" As she looked up now, fiercely and suddenly, the passion of her face startled him. "My love for him is as fresh in my heart as the day I lost him. Now you know that, Kenneth, you will leave me in peace. He was a liar and a treacherous coward, I know; he was a murderer, I believe. Is a woman who loved a liar, a treacherous coward, a murderer, fit to be loved by you?"

"This is very wild talking, Daisy. This is the madness, not of love, but of hate."

"Who can tell what it is! Only God. Madness! didn't you know I was mad? Mad, more or less, ever since—Wattie died. May not that stand between us, Kenneth? Would you like a mad wife?"

"If I thought it true, Daisy, I would at once possess myself of you. You should marry me to-morrow, that you might need no other keeper. I would deny your right to have a will about it, if I believed you mad."

"Is there nothing will frighten you from me? Is there no way in which I can be rid of you?"

"I have told you the one only way. I will go now, for to-night, that you may get rest."

She lifted sad, pleading eyes to him. She had half a notion that she was looking on him for the last time; that for his sake she might have strength some way to end things. She wished he would bend down to kiss her, but he did not. There was only a very tenderly spoken "Good-night, Daisy," and he was gone.

As he walked home he recalled some words of Daisy's that had been among the last words she had spoken to him before he left England.

"I've been thinking, Kenneth, of what you told me about Graham. I know it's true, because you told me. As it's true he can't be good. I shouldn't like to (how well he remembered the pretty flush and hesitation with which the next word was spoken!) marry any one who isn't good. I want making good, and keeping good myself. He has no promise of mine, and, Kenneth, he never will have. I tell you this now, because I have seen that you are anxious about me."

How well he remembered the exact how, and when, and where, those words of Daisy's had been spoken!

They had stood together at the glass door of the drawing-room of what was then Daisy's home, looking down the bright lawn to the shining river.

He remembered how confidently she had clung to his arm, how, while she was speaking, she kept brushing away from his sleeve petals from the overblown roses that kept falling there.

He remembered how sweet and how fair he had felt her. He remembered the hard fight he had fought to hinder himself from clasping her in his arms and saying:

"Wait for me, Daisy. It is I who love you. Wait for me, be my wife."

He remembered how hard it had been when, at parting, the sweet fresh mouth was lifted for his kiss, to leave unsaid any word that should have startled the child to consciousness of the love with which he loved her.

But at that time Mr. Stewart was not only poor, but had others dependent upon him. At that time he had no thought of the possibility of succeeding to Redcombe Manor, there being then two lives to all appearances as "good" as his between him and such succession.

When Daisy found herself alone, she set herself to think if, in any way, she might win into this heaven of happiness which seemed to stand open to her with a visible door, while by an invisible door it was close shut. There seemed to be two ways, if only either were possible. Suppose she yielded to his wish and let him make her his wife, leaving all her secret undisclosed, letting things go as they would, leaving the future to shape itself? Perhaps, had she believed in her own power to be, in this way, happy, she might have chosen this course, deceiving herself with the sophistry that she yielded for his sake. But Daisy knew she could not, so, be happy; knew that, sooner or later, the misery of concealment would become unendurable, and then it seemed to her his sorrow over her sin, his grief at her deceit, when he should come to know, would kill her. She remembered, in long past times, how he had looked when she was "naughty," when she talked perversely, and acted wilfully. Remembering the pain, which seemed both mental and physical, his face had, at such times, expressed, she had only to imagine a proportionate suffering in him, when his wife should convict herself of such secretness and treacherous deception, to believe that he might well die of such anguish. That way, then, was not the possible way. What of the other?

To tell him every thing, and trust to his love being so strong that, in spite of every thing, he should still wish her for his wife! Was this the possible way? No, no, no, she decided.

"If I knew that he knew, there would be times when I should not but be forced to believe that he must think of me with disgust. How could I bear this? I could not bear it. No, there is no way in which I may be his wife—I could not be his wife, and deceive him. I cannot be his wife if he knows. What, then, is there left for me to do?"

Daisy did not sleep this night. She tried to plan some future. If only there were but some place and some person in the world to whom and to which he would be satisfied that she should go, then possibly in time he might forget her, and learn to be happy—alone, or with some other. But there was no such person, and there was no such place.

From the misery and perplexity of this sleepless night Daisy could not seek help in prayer. How can we pray when there stands on the threshold of spiritual consciousness the knowledge that the thing we ought to do is the thing we mean, if we can help it, never to do? When we refuse to have the open eye and open ear, and choose to be among those whose ears are dull of hearing, and whose eyes are closed, must not the lips of the heart be shut from praying?

And thus it was with Daisy. She could only sob, till sobbing ceased from mere exhaustion, then turn on her pillow, trying to sleep, and find some fresh aspect of her sorrow bring a fresh burst of sobbing. Between her and the power to pray stood the consciousness that she knew what she had to do, but could not, would not, do it.

"If you will not have me for your husband, you cannot have me for your friend."

He had said so. It was true. Must she be always and utterly alone?

It was this night, that, for the first time, or rather it was in the morning after this night, when she opened her casement wide at dawn, and leaned out into the dewy gray fragrance of growth and life—it was then that, for the first time, in thinking of her child, she was conscious of a dim yearning, sweet and strong, as yet passing her by, touching her as it passed, rather than entering into her, seeming a part of the soft mist of spring rather than any thing personal.

"Perhaps it is dead!" She shivered, the balmy air seeming to turn chill at the thought. "If I knew it was dead, or if I knew it would be sure to die before it grew up, then I could love it! Any way, I should like to look on its sleeping face once more, and once more to feel its tiny hand close round my finger."

After this, often on spring evenings, the mist-veiled stars would seem

to her like the tear-dimmed eyes of little children, and the soft wind of the summer nights like the breath of little children. And she was never more able to forget that she had a child. She kept count of the weeks and the months of his age; and at any cottage child who numbered the same she would look with wistful wonder, marvelling if to that stature had grown her own little son.

It was with Daisy now much as it is, in the spring-time, with the wood primroses, when they push their leaf-lances and their little buds through the thick-lying dead leaves, the rotting beech-mast, or the empty acorn-cups, the fallen bits of hoary lichen, and the broken lichen twigs and boughs, pushing through to the softening air and the sunshine. What of fresh youth was left in Daisy was coming to life again, was struggling through and pushing aside the memories of the horrors and miseries that had fallen upon and stifled her.

Poor Daisy! Though she often felt so old, so old, and as weary as if she had all but done with life, hers was a girlish heart still, and a passionate girlish heart.

Daisy's love of nature was passionate, and, perhaps, when one is still young, the passionate love of irresponsible nature is rarely unaccompanied by longing for responsive love, a longing unconscious of what it desires, and yet a conscious longing.

A thrush's singing through the spring twilights, the summer incense of woodbines at dew-fall, rich sunsets and "mellow moon-births," the sound of distant village bells, the dream-beauty of the sunny sleep of a September day, with the dew staying all day on the brambles in the deep hill-hollows, and the gossamers lying all about on the gray hill-sides, and the soft pale sunlight on the corn slopes of late uplands, these things had always had power to touch Daisy nearly and deeply.

A mist of bluebells in an April copse, a primrose-starred bank, a flush of wild roses in a sunset hedge, a group of queenly white lilies in a moonlit garden, the music of bells, of brooks, of birds, the flooding fragrance of summer blossoms, would stir in her a sweet, sad longing; such a longing as makes many of us yearn toward something that is not, that never can be; a something that if found would enable us to hear the secret of things, to taste the sweetness of things, to live, not to lead a misty, sorrowful, dreamy existence, but to live to the core.

A POPULAR "NUISANCE."

ON the western side of this city there lies a wide, dusty, uneven tract of ground, barren of houses, with the exception of one beneath its level, and to which you descend by a series of awkward steps hewn in the clay; and barren of buildings, save a huge, iron-bolted, stone-and-mortar structure, looking much like some century-old sacrificial altar of extinct giants, but which is nothing but a tumble-down, decrepit lime-kiln, the monument of some exhausted enterprise, or perhaps of some nuisance long since happily extinguished; and also barren of life, except when, at stated times in the day, there is a sudden irruption of staggering horses, jolting, untidy carts, and of begrimed, hallooing men, who disperse hurriedly over its hot area, and deposit loads of street-sweepings, most of which seem to gather into dense clouds and sweep away over the river.

The place is honey-combed. There are countless pits, at the bottom of which is river-mud, and in one or two is some stagnant, greenish water, in which some children are forever plunging, and swimming races for the championship of the puddles. The high ridges which divide them are marked with countless devious cart-ruts, from which are precipitated countless heaps of dust, upon which, as soon as they have been deposited, groups of fierce men and women in rags, with baskets and bent pieces of iron in their hands, fling themselves, and wrangle, and curse, and pick up eventual riches by petty means of rags and glass. The cartmen stand and watch them with the momentary air of grand patricians who have flung some handfuls of coin among the rabble, and laugh derisively at the real patricians, in point of money, and feel themselves benefactors for the instant.

The wretches thus benefacted drive desperate bargains over their trifles of garbage. Whooping and begrimed, they cast themselves headlong at the dissolving heaps, tussling for scraps, and wrestling savagely for handfuls. Bare-armed, booted, furious women are the terrors here, and you find them with dingy shawls about their shoulders and waists, with draggled, tattered skirts, and matted hair, and lank, sinewy forms, perfect examples of termagants.

They chatter and brawl like furies, and plunge their hooks into their prey as if they were some avenging weapons whose each separate thrust needed an imprecation. They cast the dirt in showers upon themselves in their struggles, and envelop themselves in blinding clouds, until they have expertly wrung the utmost atom of value from the pile, when they suddenly leap in a body from the smoking confusion, and madly rush on to other heaps beyond, where they again struggle and blaspheme for their infinitesimal gains.

The miserable, unsightly ugliness of one spot is consistent with the appearance of the whole vast, dreary area. Beyond its hillocks of refuse and at the water-side there are some soiled, muddied sloops, busy at unloading some soiled, muddied stone into the soiled and muddied river. There is an unfinished pier, some hulking, iron-guarded canal-boats, much decaying cordage, and a total general aspect of distemper and disorder. On the inland side it is to be perceived that it comes by its bad character by degrees, and does not outrage any better out-look, or contrast very vividly to the great disadvantage of any other scene; for here the city ravelts out into unsightly shops, which give out a constant din of hammering; small, tottering tenements overflowing with unclean life; ricks of musty hay; useless, dismantled boilers, and kettles half-buried and discolored; fag-ends of streets and sidewalks, with staggering lamp-posts, and lofty, blackened chimneys, whose factories have been burned down about them, and which seem to be always patiently waiting to be built about once more, and set to smoking again, as has been their habit.

Thus, properly adjacent to such an unsightly and unhappy view, comes a supplementary disaffection to civic purity and elegance, that appertains to and clings about a certain pier which extends westerly and encroaches on the river. It is a matter in which nicety is not at all concerned, and yet in which there is extreme cleanliness and order. A woman with a sensitive eye or keen nerves would shrink and fly from what she would see, yet she could not but praise the length to which the delusion was carried, that she was not among things distasteful.

It comes upon one in a single turn, but up to this turn there is a certain refinement of concealment, and an almost total absence of what the senses can lay hold of to warn one. There are some few oddities about the place, such as brownish, wavy stains upon the planked walk, which give out a pungent and not unpleasant smell; it is some corrective or disinfectant, perhaps carbolic acid. There are also, among the rest, some reddish, wedge-shaped carts, opening at the rear end, and covered completely at a distance of four feet from the platform. One is told that they are late improvements,

for their burdens, when exposed as under former management, were highly unpleasant and disagreeable to passers-by. There are some dozen horses, munching busily in their cleanly-kept stalls, and there is a huge, black-and-white, slouching dog lazily snuffing about with a look of debauchery in his bloodshot eyes, which, as one takes his departure a little after, seems highly appropriate and natural; not to dwell over-long upon the beast, it is yet proper to mention that his pace, visage, and manner of looking, all seem animated by some unclean propensity, and that his whole body is permeated by ghoully tendencies unpleasant to contemplate.

There are one or two silent men in oily clothing standing about, busy at nothing but a ceaseless mopping of their hands upon their hips, as if they were constantly being fouled in some mysterious manner, and always, therefore, in need of much cleansing. As for the oiliness of their attire, however, it is by no means peculiar to them or especially disparaging, for every thing hereabout has an undeniable complexion of the same oiliness. It appears beneath your feet, and breaks out upon the stanchions of the wharf; it dyes the gangways and bulwarks of two vessels moored alongside, and stains the sides of the buildings and offices hand-high with a heavy shade, and yet there is not an atom of matter to be seen which might by any method be swabbed or washed from sight.

The two vessels referred to are hulks shorn of nearly all semblance to their former selves except their ability to float and their tall funnels, and which contain within their dingy sides what we thus slightly sketch, the mysteries of "rendering."

As are all matters and things about them, they are, even in this moment of active operation, scrupulously neat. The

floors and bulwarks are deluged with the same brown stains of deodorizing agents, and the air wafts freely across their partially-enclosed decks. All other portions not likely to be contaminated by passing impurities are freshly whitewashed, and all articles not in immediate use are neatly stowed away in their proper places.

Lengthwise with the engine-deck of our sample subject there rise five white brick mounds, to the height of three or four feet above the deck, and sink enough below it to enclose kettles or boilers huge enough to accommodate ten thousand pounds each. The tops of these are perforated by feed-holes, through which the matter passes, and by pipes which accommodate the escaping gas.

Upon the subject of this last the obliging exhibiter becomes emphatically urgent, and details the operation at great length, and with much minuteness, with so much, indeed, that it becomes a pleasure to listen to him. Among the rest he says:

"Bare-armed, booted, furious women, are the terrors here."

"Smell from here isn't possible. Tell you why. Each and every one of them there," pointing at the boilers, with outstretched fingers, to denote the five—"each one of them has a coil, eleven hundred feet in length, piled into an Argand furnace, and which carries off from the cooking mass in those kettles every breath of steam generated by the operation. Now, do you see, we give this coil a separate fire by itself, and throughout its long course it is subjected to a sharp heat, which reduces its contents to gases, which are consumed by the fire which makes them, and thus the matter which passes off through the funnels into the open air, and which was the foul exhalation of what we are all the time boiling, is a perfectly odorless heat. To prove that no effluvium whatever passes off, we treated a respectable board to a bit of woollen cloth, the other day, which had been saturated for a long time with what passed through the funnel, and, after applying their respectable noses, they unanimously declared that there was no smell save of the scorching of the fabric."

In response to more questions, he resumes:

"All to once? No; by no means. There's mostly two kettles going here, and also two on the other boat. Sometimes three each. But we rarely have occasion for more, as one kettle will accommodate a dozen horses very comfortable. Time? Oh, five hours will boil 'em so there's no knowing 'em. Bones and all. It's queer about bones. Hard as they are, they'll crumble in your fingers after coming through. And it brings matters down to a fine point. If you put in a hundred barr'ls of stuff, with the proper amount of water, of course, you're lucky, mighty lucky, if you squeeze out eight to bless yourself with; yes, sir!"

It is suggested that the residuum must be extremely unsavory, which idea has the appearance of being a time-honored fallacy, if one might judge from the quick method by which he was undeceived. In response to an order quickly given, a man as quickly brings a grayish mass upon a shovel, which appears to be a portion of the refuse in question.

"Sweet, sir? Sweet's no name for it; it's perfect!" He looks upon it admiringly. "Here's the animal, or, I should say, animals, started on their way to their final dust. This is all sold to farmers for fertilizing, and so I imagine that in this shovelful of—of—excuse me—horse—shovelful of horse there's the identical germs or limes which go into oats and corn, and so the whirligig of events naturally makes me a link between the horse dead and the horse alive, and in which there will be no hitch so long as they continyer with my salary as heretofore."

Upon hearing this, we are led to ask about the disposal of the other portions of the matter which passes through his hands.

"Well, there's the oil, that goes for machinery; there's the skin, which goes to the tanners. And do you see them?"

He pointed to some hoofs with the shin-bone attached, which were lying in a heap beside where we stood.

"And them? They goes to Newark and into Prussian-blue."

After a moment we step away a few paces, and come upon a singular and not an over-pleasant sight. It is the nucleus of the whole operation, and is so silently conducted that it would be possible to miss it altogether were not the attention especially called to it. It is the preparing of the various large carcasses for the vats.

It is all done in a space twelve feet square, and with no confusion or clatter whatever.

Six oily men slip noiselessly about, hovering over two huge masses which have as yet some lingering semblance to certain forms, but which, under the rapid plying of glittering knives, are fast losing it. They slide rather than step in their work, and their arms, to the elbows, are covered with bad stains, as is their loose clothing. Each has his separate duty, and there is, therefore, no necessity for a single word as they pursue their labor.

Large pieces are fast severed, and are dragged away with hooks and flung into the open boiler at hand. The body with its huge bones and great bulk sinks rapidly into nothing, and is distributed with startling quickness. The men lunge at it with all sorts of keen implements, and one half-expects some moans of agony to break out in protest.

The dissection is carried on much as one would fling down and separate a toy-house of bricks, but the portions fall little as bricks would, inasmuch as they give out a thud and an ill-conditioned sound which much resembles a spatter.

"Quick?" says our friend, in response to an observation. "Yes,

tolerable speedy. As speedy as this: give us a horse whole, and you have him in your hand in seven minutes after. That is, turn him into our hands at fifty-three minutes after one o'clock, and at two we've bolted him out of sight and smell."

Some observation is made regarding the health of the men.

"The labor is good for them. That lot there has been with us for three years, and they haven't had a sick day yet, neither has one of them left of his own accord. They gain in flesh and blood. Queer, ain't it?"

Then, further on, he speaks of the other boat, the one fastened farther out on the pier.

"She's built much the same as this, but she takes in the slaughter-house refuse, while we stand by larger game here. All is quiet, you see," says the superintendent, with a gesture embracing the whole of his domain—"all is neat as possible, and there's no smell; you might pass us by, and indeed walk straight into us, and not know us until you came on those fellows beyond, and they ain't much after you're once used to it. Ah, but you should see 'em at grub!"

Here he shakes his head, as if this summing-up embraced all and every advantage which was to be named.

Upon this we walk away to the office, and look over some books and papers, and examine the clerical method of the place.

"Now, supposing there's an unfortunate beast lying away up-town. The policeman is told, he sees him, he reports him to his station, he is telegraphed to the Twenty-second Precinct, and an order is wrote to me to fetch him, and so I do on the minute. Now, here's the book." He opens a neatly-kept volume, ruled into proper spaces, and drags a file of slips toward him, on which are written descriptions of various animals and the particular places in the streets which their bodies encumber. "Now, here the Twenty-second Precinct have charged me with five rats, two cats, a couple of horses, and a dog. Now I, in my turn, charge my cartman with the self-same lot, and, on his return from the specified places, each is checked off. I credit him with the rats, cats, horses, and dogs, and report back to the Twenty-second Precinct, where I am credited also, and there we are. Regular as clock-work. It doesn't make any difference how big, or how small, or how great the distance. An ox in the swamps of Harlem, or a rat at Castle Garden, is as civilly treated as a dog in Thirty-eighth Street, two blocks up from here. If any thing is missed, we can pin the loss where it belongs. Now, last week there was a goat; he disappeared mysteriously from a corner up-town. Policeman saw him with his own eyes, telegraph knocked him off, he was wrote out, and he was sent for, but, like the old boys bid to the feast, he wasn't to be found, and so there's a debit all around the lot to the policeman again. Who's to blame? Nobody. Maybe the goat's arose, but most likely he's gone to manure some squatter's squash-patch; there's one of the mysteries of our trade, but it ain't often.—Goin', sir?"

It is vaguely promised to drop in upon him at some and indeed many future times, and we step away under the close surveillance of the huge dog, who has in some way become almost frightful; and pass some carts unloading soft-hard bones and skulls into barges, and into which they fall with a sudden rattle, and slip over each other as particles of thickened water do, and find their level. Still all is neat and cleanly, and the sharp pungency of the acid arises from about us and beneath our feet, effectually putting to rout all worse perfumes, and destroying all vestiges of the place, now that our backs are turned upon it, and we step into the torrid, scorching, dismal, unsightly area without the latticed gate, and stumble away over the dust-heaps.

AT SEA.

MY friend Snedico has been insisting that I am ill, and has exhausted his limited stock of medical knowledge in diagnoses and prescriptions. It is true, that I have not been conscious of disease; but my friend thinks this the most serious of my symptoms.

"It's your liver, Jones!" said he, three weeks ago; "now, if I know any thing about diseases, I understand livers. Torpid, my boy, torpid! You see, when the functions of the liver got cranky, the whole system is disarranged." Here he paused, and pulled his long mustache, thoughtfully. "I think," he resumed, "calomel is the dodge for you. About twenty grains. By Jove! I've got a lot in my pocket now! Bloker told me to put some on my mare's leg. I can

guess at twenty grains." So he tore off the back of an envelope, opened a little package of white powder, and dipped up a small teaspoonful, which he gravely folded in the fragment of an envelope, discoursing the while impressively.

"The exhibition of mercury in some form, for liver-diseases, may be called the mathematical part of medical treatment. In fact, it is a specific. As a general rule, physic is a humbug. You never catch me going to Sawbones for advice. I believe in the *vis med*. Still, when the liver is involved, it is time to *do* something. Now, old fellow, just take this little powder to-night, and drink—say—two great tumblers of Congress-water before breakfast to-morrow. You'll feel rather shaky for a day or so; but you'll be a new man in a week! By-by! It's a good thing I happened to notice your looks!"

On my way home, by train, I waited until we were crossing the river, and then I dropped Snedicator's prescription into its placid waters. I like to fish in that stream sometimes; but I think I shall give my flimsy friends time to get over any liver-complaints they may have, before I trouble them with a line again.

I met Snedicator within a week. Of course, he would ask me about the effects of his treatment, and I was not entirely prepared to describe them accurately. I could not get my own consent to *lie* out of the difficulty, and, anyhow, I had not time to concoct a plausible story; so I forestalled inquiries by assuming the offensive.

"I wish you distinctly to understand, Mr. Snedicator," I began, with an air of injured innocence, "that you are not going to try any more pharmaceutical experiments upon me! That lot of calomel was enough to dose an elephant!"

Snedicator laughed consumedly.

"Ah! my boy!" he said, with tears in his eyes, "I knew what I was doing! Why, you look fifty per cent. better! Now, if you will take—"

"I'll take none of your confounded stuff!" I answered; "the very thought of your last dose makes me sick! Ugh! I think I'll go to Newport and spend a couple of weeks."

"Newport be hanged! No, no, Jones! I've begun the cure, and I mean to complete it. You shall have a sea-trip!"

A sea-trip! I had been thinking about it for a solid month. In fact, I had a hankering for bounding billows. I had been sneakily humming:

"The sea! the sea! the open sea!"

I had conned the maritime advertisements in the daily papers. "For freight and passage, having superior accommodations, apply," etc. I had even consulted Amelia, my amiable sister, who persistently ignored my symptoms, and who settled the question for the time by the application of her vigorous feminine logic.

"I have heard," she began, "that nine-tenths of the passengers on ocean-steamers suffer terribly with sea-sickness. You know, brother, that you are easily upset, and I think it would be sheer madness for you to try such an experiment!"

"Sawbones says the temporary sickness is sometimes beneficial."

"Not to men of *your* age, I imagine," answered Amelia. This was a needle-gun bullet, and it laid me out. Amelia had charge of me when I was a toddling infant, and I am inclined to think she whacked me occasionally. So, when Snedicator proposed the sea-trip, the old banking revived, and I cordially yielded to his superior judgment. It would not do to fall into his plans too easily, however, and I timidly hinted some slight objections. These were pooh-poohed into smoke, as soon as uttered.

"Now, look here, Jones," said my friend, dogmatically, "my mind's made up! We'll go to Halifax in the Inman boat, next week. *I'll* go. Two solid days at sea, a-rolling on the briny deep! We can get back by way of Portland."

"I cannot undertake so formidable a trip, Snedicator, except by medical advice. If the doctor *orders* a sea-trip, I'll obey; and I may add, that I shall not object to *paying* for advice. But, until you produce your diploma, I must decline—"

"All right, my boy!" said Snedicator, "pack up. Next Toosday, 1 P. M. You shall have your orders in the mean time."

On Saturday, Amelia handed me a note, at the dinner-table. It was from Sawbones, and was gotten up artistically. I recognized Snedicator's management, but said nothing to my sister.

"My dear Jones," it ran, "my opinion is, that your health needs looking after. I do not think you need positive medical treatment,

but I advise you to get away from your books for a week or so. It will do you no good to go to the Springs. Send Miss Amelia to Newport for ten days, and spend the same time on the sea yourself. She requires the relaxation, and you will be greatly improved by a good shaking up. Any of the short-trip steamers will do.

"Yours truly,

"J. SAWBONES."

"Pish!" I exclaimed, tossing the note across the table. Amelia read the missive twice. I looked as unconcerned as possible.

"You have no appetite, brother. Try a wing of this chicken."

"No more, I thank you, sister. I cannot get my own consent to feed on the innocent fowl. Probably the vegetarians are right, after all. Potatoes and salt, and then a peach, will suffice me to-day." (I had had a good lunch.)

"You don't appear to favor Dr. Sawbones's opinions."

"Oh, it's a scheme of Snedicator's!" I answered, with rare honesty; "he wants a sea-trip, and wants my company. I have not spoken to Sawbones about my health, or about any thing else, for a month."

"It would be beneficial, though, or the doctor would not recommend it. You eat nothing, and sea-air might improve your appetite at least. If you decide to try the experiment, I have no objection to Newport for a week. In fact, Mrs. Spangle invited me to-day to go with her on Monday. You know she has a cottage."

"Well. Suppose I go with you to Newport?"

"The other plan is better, I think. I saw in the papers that the City of Albany sails on Tuesday, touching at Halifax."

"Tuesday?" I replied, deliberately and deceitfully. "I suppose I shall not need much baggage? Well, Amelia, if you think it advisable, I will escort you to the Newport boat on Monday, and take passage for Halifax the next day."

I have written thus far on top of my hat-box, in my state-room. Snedicator is on deck. We have been from the pier about two hours, and he has smoked about seven cigars. All my surroundings are novel. The dimensions of my apartment, when compared with the house occupied by Carlo, my dog, may be termed spacious. Seated on the edge of my berth, I find the opposite wall very convenient, as it prevents my slipping, and supports my knees. Snedicator selected the upper berth, which is filled with rugs, valises, and overcoats. Where he is going to store them to-night, I cannot imagine. Indeed, I await with some awe the sleeping-hour, to resolve the doubts which now haunt me respecting the disposition of Snedicator's legs. I suppose there are several screws loose about the steamer's machinery, as I notice a peculiar shudder that seems to pervade the boat from stem to stern. Our room is in the stern, and Snedicator pointed out a stick in the other end of the vessel, which, he said, was the stem. It is tied to other sticks, which are nearly perpendicular. There are three of those, tied to one another in the most curious and complicated manner. Somebody is in the adjoining room in dire agony. I have endured the groans, which come through the thin partition, until my life is a burden. I shall arrest the "stooard" when he passes my door, and institute inquiries.

The stooard has passed, and I have obtained the information.

"Oh, bless your heyas, sir, *that's* nothink! Honly a passerger as fancies hisself sea-sick. He's tryin' to caust hup, sir, and, bein' as he's heaten nothink, why there's nothing to caust!"

I have written this down, and, when Snedicator comes in, I shall get it translated. I get confused when I attempt to master the lingo of the sea, and, as far as I have been able to judge, it does not accord with sea-lingo in books. I heard a man, wearing a cap with a gold band, shouting, as we left the pier, "Caust off that line!" and I saw another man, less gorgeously attired, untie a rope as thick as my leg. I wonder if the rope was the line referred to, and I wonder if untying it was "causting off?"

If Snedicator's legs should prove too long for his berth, it is probable that he will kick a panel out of the partition, and disturb our ailing neighbor. I think I shall suggest the propriety of making up a bed on the floor. It will accommodate him from his knees up, and he could put his feet out in the passage. I suppose the stooard goes to bed somewhere at night. If he passes up and down this long passage all night, Snedicator's feet would be somewhat troublesome.

Sawbones was on the pier when we sailed. He grinned suspiciously, and asked me if I received his note. I answered in the affirmative, and paid him five dollars. He threw in a piece of advice gratuitously.

"Jones," he whispered, "Snedicor intends you to be sea-sick. Now, if you will just nibble pilot's-bread for a day, and sip champagne—a table-spoonful at a dose—you will probably escape. Seasickness is all a notion anyhow."

I will accost the stooard again when he returns. He has come and gone, and I record the interlocation for future reference.

"Stooard," I began, "where can I find the pilot?"

"Pilot, sir? Bless your heyes, sir, he's been gone a bower. Want to send a letter, sir?"

"No. I only wanted some of his bread. I have—a curiosity to taste pilot's-bread. A small loaf. And a bottle of champagne."

The stooard worked his features convulsively, put his knuckles in his mouth, and coughed.

"Yessir! I can get you some," and he retired, muttering, "Loaf o' pilot's-bread! My heyes! 'ere's a go!"

He brought me half a dozen crackers, as large as dinner-plates and hard as stones, a lump of cheese, and a bottle of Piper Heidsick. I have had a "dose." Sawbones entirely forgot to tell me the proper intervals between doses. It is very wishy-washy stuff. The ship has acquired an entirely new motion, retaining the old shudder, however. It, I mean she, is now practising a new sort of marine dance—a kind of *chasser de chasser*, in addition to the inevitable pitch. She slides sideways, as if she were greased. I suspect she is. There is a distinct oleaginous odor pervading the atmosphere, despite the sea-breeze. I'll take another dose.

Snedicor has just looked in, and has descanted largely upon the beauties of the ocean. I promised to join him on deck in half an hour. He says we are "off-soundings;" but the unearthly groans of that poor devil next door—I mean next berth—are very much like sounds to my mind. Snedicor took several doses in one, and then repeated them, without asking for directions. He is a man of wonderful capacity. The stooard has just informed me that dinner is ready. I must put on a black coat, I suppose.

The dinner was of good quality, and too abundant in quantity. I cannot imagine what will be done with the loads of edibles remaining after the passengers had dined. Snedicor stuck to his curriculum—his ordinary vinous circle. He began with sherry (which was horrid), sipping it while I chased the soup round my plate. We had bluefish and striped bass—the latter was magnificent. Snedicor enveloped a pint-bottle of "Sauterne;" then beef in various styles of cookery. Snedicor had a whole bottle of Piper Heidsick "for both of us." But I was mindful of Sawbones, and adhered to tablespoon doses. There was a profusion of puddings and pies, and my friend partook of all liberally, finishing with a whole bottle of claret. He then proposed "a turn on deck," but he did not confine himself to one turn. Hooking his arm in mine, he favored me with much valuable advice, while he took his turns.

"You see, Jones," he observed, with thickened utterance, "you'll get no benefit from this trip, if you eat and drink nothing. D—n the ship! how she pitches! Isn't this glorious? I was reading about the sidereal heavens the other day. I think we must be on them. The bark seems to be going more sideways than longways! Don't she, Jones? How she shakes! Jones, do you feel at all sick?"

"Not at all. Suppose we go down, Snedicor?"

"Go down! Ha! ha! ha! I knew you would catch it! No, no, my boy! Stick it out! D—n that puddin'! It feels just like a lump of cold lead on my stomach! Jones, ask the Captain if he will stop the ship a few minutes. If I could get five minutes' rest from this shaking and pitchin'. Ah! Hello! Let's get to the rail, Jones. That infernal puddin' was one too many! Outch! how she does pitch, to be sure! Could you ask the stooard for a drop of brandy? About a pint."

I steered to larboard, and then to starboard, I suppose, as I pursued a zigzag course to the cabin stairway. After blundering through narrow passages, I fell suddenly into the arms of the stooard, as he emerged from a state-room. I made known Snedicor's wants, and took the stooard's arm to assist him on deck. We found my friend doubled up in a pitiable state, hanging over the rail; his eyes looked fishy, and his gills pallid and flabby. He took the bottle in his tremulous gripe, and gulped down sundry doses; next, he made another feeble attempt at hilarity.

"Stick it out, old fellow!" said he, persisting in his idea that I was the sufferer; "stick it out! You did not indulge in that infernal

puddin', It'll all pass off d'rectly. If you could persuade that devil of an engineer to stop his machine a minute—suppose you ask him, Jones?"

I staggered forward once more, and succeeded in finding the engine-room. I could not get in, fortunately, as I should have been mixed up in the complicated machinery in five seconds. A serious gentleman was intently regarding two iron bars, which appeared to be trying to climb to the upper deck. One went up, as the other came down. There were various wheels and levers whirling and chopping about in the most distracting manner. An agreeable odor of hot train-oil pervaded the apartment.

"Are you the engineer, sir?"

The serious man nodded.

"Would you object to stopping the machinery a short time, to oblige a gentleman who is a friend of the captain, and who is slightly indisposed?"

I said this in my most polite style. The serious man stared at me fifteen minutes; he was debating several questions in his own mind: was I drunk? was I a born fool? or was I attempting to crack a harmless joke? I saw all these suggestions in his stolid countenance. He appeared to make a mental equation while he stared. At last he spoke, and, as his discourse flowed on, he dabbed a greasy swab here and there in the mass of laboring iron, missing a crushing blow by a hair's-breadth, withdrawing his hand from the nip of the moving arms precisely as the nip occurred, and thrusting the swab back again in the jaws of destruction, until I became half frantic.

"If the cap'n will write me a note" (swab, swab), "and take the 'sponsibility, bein' a good head of steam on" (swab, swab), "and the ship goin' fifteen knots, and a goodish breeze on the port quarter" (swab), "and if you could hunt up a parson aboard, to read pra'rs in the after-cabin before we go down in consekens of busted biler" (swab, swab), "I s'pose it would be as good a way of going to heaven as any. But, you see, sir, I must have written orders."

All this was said with great deliberation, and in a husky voice. This worthy gentleman was evidently lineally descended from Casablanca of the burning deck. He was still poking his hand and arm in the openings made by the chopping machinery, as I withdrew. It is my deliberate opinion that he is doing the same thing at the present moment, unless some other unreasonable passenger has prevailed upon him to stop the "biler" and take the dire "consekenses."

HALIFAX, Friday morning.

Since we were landed, I have vainly endeavored to find a route—all rail—by which we may return to the land of liberty. As for a return sea-trip, I am resolved to die here, or go home by balloon, before I again dare the dangers of the deep. After my colloquy with the serious engineer, I retired to my state-room, and passed an experience entirely novel to me. Snedicor enjoyed similar hygienic exercises, but is remarkably reticent about them. His only remark concerning our sea episode, since we came ashore, referred to the commissariat.

"I say, Jones," he observed, blandly—"d—n that puddin'!"

In case any of my friends should require a restorative during the dog-days, and in the hope that they may escape the clutches of their Sawbones and Snedicors, or any other emissaries of the Arch-Fiend, I beg to offer a substitute for a sea-trip. I have "thought the thing out," in moments of dire agony, and in subsequent hours of blissful repose on *terra firma*. The advantages of my substitute are numerous: it is comparatively inexpensive; it involves no care of luggage; it can be enjoyed on one's own premises; and, instead of employing a ship's-crew, four muscular friends can put a patient through the entire course.

First: fasten to your extremities a system of cog-wheels, to be set in rapid motion by the mainspring (second-hand will do) of a steeple-clock. This will simulate the shudder of the machinery. Mix two pounds of powdered ipecacuanha and three and a quarter pounds of tartrate of antimony and potash, and take a teacupful of the mixture every five minutes, alternating with the same quantity of tincture of lobelia. This will simulate the sea-nausea. Close the doors and windows of your apartment; kindle a fire, and boil a two-gallon pot of train-oil, leaving the cover off the pot. This will simulate the balmy sea-odors. Then get four muscular Christians to toss you in a blanket until you come out of your boots, through the legitimate effect of the

internal exhibitions aforesaid. You may then safely tell your anxious friends that you have been "to sea," and have enjoyed the trip immensely; for you will have passed through all the experiences of bounding billows. Seize the opportunity, and see the enjoyment to be realized in the proper season "at sea."

A. JONES.

MY FRIENDS.

I'VE no great nor titled friends—
Lords nor dames of high degree;
Grandeur ne'er my steps attends,
Rank nor glory compass me.
Throwing wide my garden's gate,
Courtiers ne'er its paths explore;
And no liveried footmen wait
At my humble cottage-door.

Yet at pensive eventide,
When the day's long toil is past,
And from wanderings far and wide
Thought comes home to rest at last;
When the firelight, leaping high,
Brightens all the quiet room,
And the startled shadows fly,
Bearing off the dusky gloom;

Then—a brave and noble band—
Over mount and over sea,
And from out the "summer-land,"
Come my friends to sit with me.
Heads with bay-wreaths greenly crowned;
Hands that clasp the victor's palm;
Presences that all around
Shed a most unearthly calm:

Chaucer, wearing on his face
All the freshness of the morn;
Dreamy Spenser, whose rare grace
Far in faerie-land was born;
Milton, grand, majestic, blind,
Yet seeing God by inner sight;
Shakespeare, in the realm of mind,
Crown'd king by kingly right;

Dante, with uplifted brow,
And a sadly, royal mien;
Camœns praising, soft, and low,
"Sweetest eyes were ever seen;"
Keats, to whom the spring-time brought
All the glory of the year,
And whose dying strains were caught
By the angels listening near;

Wordsworth, in serenest calm,
Holding converse with the skies;
Cowper, singing some low psalm,
Set to human harmonies;
Byron, still forlornly proud,
In his desolate disdain;
Shelley, dreaming of his shroud,
By the blue Italian main—

These—and others. Ah! the place
Seems a temple grand and fair:
To whose lofty, vaulted space,
Priest and priestess still repair!
Sappho, with her golden lyre,
Crowned Corinna's kindling cheek;
Pale Aspasia's eye of fire,
Saintly Heloise, strong, yet meek;

Hemans, breathing changeful strains,
Half of joy, and half of woe;

L. E. L., whose song contains
Just a fond heart's overflow;
Our own Margaret's lifted face,
Wearing still its queenly dower;
Sorrowing Brontë's quiet grace,
Veiling such transcendent power.

Ah, another!—priestess, seer,
Bay-wreathed poet, three in one—
Star-crowned angel, singing clear,
Where there is no need of sun—
Thou whose Florence mourns thee still
Less as woman than as saint—
Whose Aurora's voice can thrill
With new life hearts long a-faint—

Need I name thee? O beloved!
Friends of mine, through good or ill;
Others fail me—ye are proved—
Time nor change your hearts can chill!
Ye who being dead yet speak,
Ye afar and yet most near;
Let your words the silence break,
And my soul runs quick to hear!

JULIA C. R. DORR.

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

II.

"THE STRANGER WITHIN THE GATES."

MOUNTED upon Egyptian steeds—with Turkish saddles, with housings of green or crimson velvet, and bridles and trappings truly wondrous to look upon—we sally forth to visit an Egyptian prince of the blood, whose palace is just outside of the city gate, opening on the road which leads to Boolak, the old port of Cairo on the Nile.

Before each of our horses runs a sable *sais*, or groom, of the race termed Berberi, in Egypt; not a negro of the type we are accustomed to see in this country, with the flat foot, slouching gait, and awkward form, but a species of human greyhound, supple, spare, and sinewy, and with almost the fleetness of foot and agility which characterize the animal to which we have likened him. Neither in face nor figure does he resemble the African we know, having high, clear-cut nose, and thin, compressed lips. His dress is very picturesque though simple, consisting of a white undershirt, over which is a short frock of white or blue stuff reaching only to his knee, with a red-morocco belt tightly girding in his waist. His sinewy black legs are bare; red-morocco slippers with pointed toes complete his costume, and these he usually takes off while running, stowing them away in the capacious bosom of his upper gown. In his hand he carries a short staff, and as he runs on in advance of the horses, he shouts and strikes at all persons impeding the way, with a warning cry of "*Oa yen ragl!*" "Get out of the way, O man!"—"Oa yen bint!" "Get out of the way, O woman!" enforcing his warning by the liberal use of his staff—for the servants of those who ride consider themselves privileged to take liberties with less fortunate pedestrians—unless they be Franks, whom they are shy of meddling with, through fear of *bastinado*. A running *sais* will move on in advance of your horse in a long, swinging trot for hours, without apparent fatigue, or showing a drop of moisture on the dusky skin, being trained from their earliest youth, and becoming practised gymnasts in this kind of exercise, every man of them.

Our two precede us, until, stopping suddenly at a high wall, one of them strikes with his staff on the gate sharply, crying out, "*Efta el bab!*" "Open the gate." No attention being paid to his summons, he strikes again, more sharply, shouting, "*Boab efta!*" "Door-keeper, open!" and then a response comes from the other side: "*Da deh?*" "What is it?" "*Effendi foak?*" "Is the master at home?" "*Aioah foak!*" "Yes; he is at home!" During this parley, the gate is slowly opened, and reveals the head of an ancient, white-bearded Berberi, with dark-blue robe and white turban, who, repeating "*Effendi foak!*" again squats down on his *caffass*, or wooden seat, not unlike

a hencecoop, which serves as his chair by day and bed by night, and tranquilly resumes the interrupted smoke of his long *chibouque*.

His sole duty is to sit at that gate, day and night, to open or close it, and he seldom stirs from it. As a general thing, he is not a man of family, and, if he has any, it is invisible, for "his being is a thing apart." He is the emblem of solitude, the remote ancestor of that busy being, the French *concierge*, the most terrible tyrant over the French household—at once spy, scandal-monger, and domestic nuisance. But the Boab, like Gallio, "cares for none of these things," and passes most of his existence in alternate smoking and slumber.

Admitted by this grisly janitor, we find ourselves in a square courtyard, open to the sky above. A pet gazelle, with symmetrical form, soft dark eyes, and dangerous, dagger-looking horns, starts up and surveys us shyly. A cynical-looking white donkey, tethered in a corner, greets us with a prolonged and resonant bray of welcome; several slaves, of various colors, sit in a circle, making cushions for divans; the space around them strewn with wool and other materials. On all four sides of the court rise up the high walls of the palace, no windows below, but high up latticed wood-work trellises are seen through loop-holes, at which an occasional human eye is perceptible.

We dismount, our *sais* holding our stirrups, and taking the bridles, and a black Nubian slave, suddenly appearing, salutes us, and leads the way to a small door, and we pass up a flight of marble steps into the interior of the palace. At the head of this flight we find a long suite of apartments, splendidly furnished in Eastern style; long, low, broad divans covered with silk, and with pillows strewn over them, constituting the chief furniture. The floors are of wooden mosaic-work, inlaid in squares like a checker-board, with long narrow strips of carpeting running through the centre, over which we follow our sable guide.

At the end of this long suite, squatted on his divan, we find the Egyptian gentleman on whom we have called. He rises up, courteously salutes us in Oriental fashion, touching with his right hand his brow, lips, and heart, and motions us to take seats at his side.

We see a man of fair, ruddy complexion, closely-clipped reddish beard and mustache, with shaven head, wearing a red fez cap, but otherwise attired in European costume. When he speaks, his French is as pure as that of a Parisian, and the ease and elegance of his manner truly princely. We glance around the room, and find it furnished chiefly in French style, with highly-gilt chairs and ottomans; in the centre of the room is a marble fountain. By the time we have seated ourselves, attentive slaves present us with the long *chibouques*, with amber mouth-pieces, inlaid with precious stones, and with egg-shell coffee-cups of porcelain resting in silver *zarfs*, incrustated with precious stones. We smoke and sip, and the prince converses freely with us on his *souvenirs* of Europe, and especially on his travels through Italy, precisely as an educated European might do.

Nothing in his appearance, manner, or conversation, would induce you to remember that you were talking to a man of another race and religion from those of Christendom; or that in character, life, and manners, this courteous gentleman was your very antipodes; yet in truth such is the case. "Scratch a Russian, and you find a Tartar!" said the first Napoleon, and the remark may as justly be applied to the modern Turk or Egyptian, conforming, as he now often does in public, to the external forms of our civilization, but loathing them in his heart, and utterly repudiating them in private. For all this affectation of dress and manner before Europeans is but a masquerade. The real inner life of the sons of Othman is the same as it was in the most palmy days of the pride and power of his race, for the social system of the East has undergone no change, and society is moulded by the domestic life of every people. The prince we visited was Ismail Pacha, now Viceroy of Egypt, an educated, even a cultivated man, but as thorough a Turk at heart as any of his ancestors who wore the turban; for the other wing of his palace was dedicated to his harem, which could boast of more female occupants than Brigham Young's block of brick houses; and in that harem the prince forgot the costume and the customs of the Franks, and lived his real life in true Oriental fashion. That life is as different in all respects from ours as the East is from the West, in its natural products, in its skies, and in its people.

Reverse all your own ideas and prejudices, and you have those of the Turk; and of this many curious exemplifications could be cited even in ordinary habits. Thus, on entering a place of worship, or visiting a superior, as a mark of reverence, the Oriental takes off his shoes, and keeps his head carefully covered. If you are dining with

him, the greatest attention he can show you is to roll up a morsel in his fingers and pop it into the mouth of his guest. He writes and reads from right to left, reversing our system. When he admits you "into the bosom of his family," it is only on his side of the house, and it is a breach of etiquette even to inquire after the females of the family. The nearest you can come to it is to inquire after "the health of his house."

The Egyptian gentleman is hospitable, and not only insists on your smoking and sipping coffee every time you visit him, but asks you to dinner frequently if intimate, and that dinner is a good one always. But his hospitality is confined to his own side of the house. If he gives you music or dancing, it is from paid performers of very unequivocal character, and he never thinks it time to "join the ladies upstairs." But, if you do not see the women of his household, they see you, while you dine or smoke, through peep-holes, contrived to gratify their curiosity, but the most you may see is a bright eye peeping through the lattice, as you ride away. This constitutes the peculiar feature of social life in the Orient, and gives to its character its exceptional form. Let us then lift the curtains of the "closely-veiled harem," and without our host's permission, as he drowsily nods on his divan, take a peep at its inmates. For behind those curtains is formed, in childhood, the character of the Egyptian youth; and here, in manhood, does he find his only real home.

THE GERMAN ARCTIC EXPEDITION.

IN May, a year ago, the steamer *Germania*, with a small schooner, the *Hansa*, as tender, sailed from Bremen to explore the Arctic Sea, and push as far as possible toward the North-Pole. The two having parted in a boisterous gale of wind, the *Germania* wintered in latitude 74° north, on the coast of East Greenland, and sent out sledge-parties which travelled up the coast to 77° north, obtaining additions to geographical science. The ship returned last September to Bremen, all well.

The same good fortune did not attend the *Hansa*. After parting company with her consort, she was steered to the north in pursuance of instructions, and in endeavoring to force a passage through the ice became beset, and on the 19th of September was completely frozen in, in latitude 73° 6' north, longitude 19° 18' west. Amid news of battles, sieges, and painful diplomacy, this last-finished adventure in Arctic discovery will scarcely be noticed, and yet it involved conflict with danger and heroic endurance, which, simply told in the journals of Dr. Gustav Laube, of the University of Vienna, and Dr. Buchholz, of the University of Griefswalde, both of whom were attached to the expedition for scientific purposes, command admiration. Anticipating the publication of these journals in another of the many books that make up the library of Arctic expeditions, let us translate, from Petermann's *Mittheilungen*, a sketch of the last adventurous voyage undertaken to explore hitherto inaccessible seas and shores.

The sledge-parties from the *Germania* were perpetual through last winter. They were absent on their respective tours from six to eighty days, travelling from forty-four to seven hundred and sixty miles. Often a bear, a wolf, or musk-ox, attracted attention around, while remarkable parhelia glittered aloft in the heavens. Mock-suns—arcs concentric or inverted—and segments of inverted arcs, showing the brightest of prismatic colors, are described in the journals with mathematical precision. These phenomena were most brilliant when the cold was most intense. An observant English tar, who seems to have been the Sam Weller of the *Germania*, remarked upon these coruscations, that "when them 'ere sun-dogs shows themselves we always gets double allowance from Jack Frost." The men cheerfully faced the biting gale and sturdily advanced against the snow-drift. Often the snow lay deep and soft, with a crusted surface through which the entire party sank. Again, the route was over long waves of suddenly-frozen ice, studded with hemispherical icy mounds. Some of the parties were frost-bitten; others had snow-blindness in one or both eyes; and all suffered from aching limbs. Yet no man's heart shrunk from the encounter with cold, pain, blindness, and peril of life. In drawing the sledges, the snow-blind were placed in the rear, as vision only was needed in the leaders to see the way. Wine of opium was applied to the eyes of the sufferers with good effect, though it caused excruciating pain. Often, in drinking, the lips adhered to the edge of the vessels, and the accumulation of ice on the beard continually irri-

tated the mouth. Washing being impracticable, every face acquired a dark complexion, begrimed with dirt and soot. The big toe on the left foot of every one was frost-bitten. One poor fellow, refusing remedies, who kept bravely dragging at a belated sledge all night, succumbed the next day, and now rests in a grave beneath the chilled surface of Griffith Island. At one time, when the whole party of nine men and sixteen dogs were cramped together in a tent, pressed in by accumulation of snow, the growl of a white bear was heard close by. The dogs seemed paralyzed with fear. Bruin poked his nose upon the poles and brought down the canvas on top of dogs and men together. The position was imminent. The dogs escaped, howling. Cramped by clothing and skins, the men with difficulty crawled out from the smothering surrounding. All ended safely, however, and it is satisfactory to know that the beast paid for his temerity with his life.

The most remarkable of these journeys was made by Dr. Buchholz, with a party of ten sailors and twenty-eight dogs, who reached one of the western points of Melville Island, distant from the *Germania* three hundred and sixty miles in a direct line, which it took eighty days, going and coming, to accomplish. The indomitable spirit of the doctor's associates is well illustrated by his own statement, that the most disagreeable duty he had to perform was to enforce the return to the ship of those men who had received injuries, much greater than they themselves were aware of, and who evinced the strongest desire to proceed, even endeavoring to conceal from each other their frost-bites and the pain which labor occasioned them.

To understand the value of these sledge-expeditions, it is necessary to remember that the eighty-third parallel bounds our knowledge. All beyond is a blank to geographers. Parry in 1827 barely reached 82° 45'. Kane in 1864 touched only 81° 22', sighting at the same time a lofty mountain which he estimated to be in 82° 30'. What lies beyond is the problem to be solved. Is it an unbroken wilderness of ice? Is the great ocean around the North-Pole forever stiffened into a shapeless mass of unthawed hummocks and unchanging icebergs? Or, far beyond where civilized man has penetrated, is there, as all authentic evidence goes to prove, a bound to the ice, an open ocean, and an outlet to the mysterious channels beyond?

The *Germania*, as has been said, returned safely to Bremen last August. She brought no news of her consort, the *Hansa*. The two ships had parted company in August, 1869. Nothing had been heard afterward of the stanch little tender. She was last seen making her way in the midst of a driving snow-storm through floes and fields and bergs, her head bravely facing the northwest. Nothing more. "Quick! quick! bear a hand everywhere and with every thing!" had been all that under Providence had saved the *Germania* from being crushed between the floating masses on that fearful August night. The *Hansa* disappeared, perhaps to go down in the gale, perhaps to be driven into the unknown west which swallowed up Franklin and his one hundred and thirty-nine picked seamen. Friends of the absent began to be alarmed. The University of Vienna, which had lost its Dr. Laube, were urgent to dispatch a ship of rescue. The committee of management, hampered by the unexpected war, were at their wits' ends what to do. In the midst of the excitement news came from Copenhagen of the safety of officers and crew, and in October the missing mariners were all landed, not one lost, at Bremen. Their story may be shortly told.

The *Hansa*, after parting company with the *Germania*, was steered northward. In endeavoring to force a passage through the ice, she became beset, and on the 19th of September, 1869, was completely frozen in. This was the beginning only of tribulation. Ice accumulated around the vessel. Immense pressure from floating masses in the sea beyond increased. Her timbers began to crack. The drift of the whole body of ice perpetually changed her position. Like wedges driven in one after the other, the floes pressed upon her keel, until nipped beyond all her timbers could endure, she went down, a shapeless wreck.

The officers and crew, fourteen persons in all, escaped. They were twenty miles from land. Provisions, cordage, and stores, had been previously taken out of the ship. It was the last of October. On the huge floe they made themselves a home. There they built a house with planks and sails; enclosed it with blocks of ice and snow; stacked around it their barrels of provisions; heated it by a huge fireplace; contrived to ignite the blocks of coal that had been saved; made of mattresses and blankets, buffalo-ropes and skins, a common sleeping-place; organized themselves into regular watches; formed a compact

that no one of their number could break without consent of the whole; and so passed the winter, trusting to the southerly drift on which the Arctic ice is slowly borne. No discipline was ever more severe than that to which these fourteen men voluntarily agreed. They formed a community more perfect than Lebanon or Oneida. The word of command from the head became law to all. Even the bears and foxes that visited them were not molested without previous concurrence.

At the end of December observations taken four times daily showed that they had drifted more than five degrees. They had been nipped at 73° 6'; they had been carried down to 68°; a distance, in virtual midwinter, on a solid area of ice, without perceptible motion, of more than three hundred miles.

About the middle of April, in storm and mist, greatly to the surprise of all the party, the floe began to break up. Loud noises, sometimes resembling thunder, sometimes successive and sharp as volleys of musketry, were heard all around them. Hummocks were observed to settle. Fissures like Alpine *crevasses* were observed. Motion became apparent. The area around, which in October had comprised many square miles, was reduced to rods. Their house was destroyed, and, taking to their boats, illy clad and short of provisions—so suddenly at last had they fled from their insecure shelter—they awaited for five days and nights the final destruction of the floe. The southerly drift continued, and the voyagers were swept along with it. On the 7th of May the observations taken showed them to be at 61° 12'; Cape Farewell could not be far distant; steering out therefore into the dangerous sea, with leaky boats, scant cordage, and one unshipped rudder, with half rations and brackish water, they battled their way through and over the ice to the shore. On the 13th of June, they entered a bay and found themselves at the Friedrichstal Mission Station, where their weary and perilsome voyage came to an end. From the mission the adventurers went on to Julianshaab, where they found passage to Copenhagen, and landed in that port September 1st.

There are novel points about this expedition which will be studied with interest by those who are contemplating as well as those engaged in fitting out another Arctic expedition. The time and distance of the drift are, it is believed, the greatest on record. Much has probably not been gained for geography by either of the voyages. But the observations made by the scientific men on board both vessels—the meteorological data collected—and the narrative of perils encountered by the heroic little band of the *Hansa*, every individual of which (to the amazement of the Esquimaux that any one survived such a weary drift upon a field of ice), arrived safely home, will add an interesting volume to Arctic-voyage literature.

N. S. DODGE.

PROSPER MÉRIMÉE.

PROSPER MÉRIMÉE, member of the French Academy, senator, the accomplished scholar, the elegant and witty writer, whose productions have charmed the lovers of French literature for the last forty-five years, recently died in his villa at Cannes, on the shores of the Mediterranean, after a lingering illness of several years, at the age of sixty-seven, leaving a blank behind him which few of his contemporaries are qualified to fill.

Having studied for the law, he was received by the faculty as an advocate, but never exercised his forensic capabilities—the fields of literature, over which he delighted to roam at will, proving too great an attraction for his talents and genius.

After the Revolution of 1830, the Count of Argout, then minister, selected him as secretary for his cabinet, and afterward appointed him secretary of the Board of Trade, and head-clerk of the Admiralty-office. In 1831 he succeeded M. Vitet as the inspector of the ancient historical monuments of France, a post which he retained until the time of his death, and in which he acquired his reputation as a distinguished antiquarian and archæologist. In 1848 the provisional government selected him as one of the commissioners charged to take the inventory of the possessions belonging to the Orleans family. Some time afterward, when the tribunals gave judgment against M. Libri for adhering to the Orleans interest, the fidelity of M. Mérimée to the same cause led him to recriminate against the decision of the judges in two letters inserted in the *Revue des Deux Mondes*, for which he was fined and imprisoned for fifteen days. In 1844 he succeeded

M. Charles Nodier in the French Academy; in 1853 he was nominated senator and free member of the Academy of Inscriptions; in 1860 he was made commander and in 1866 grand-officer of the Legion of Honor.

The wide range of M. Prosper Mérimée's attainments enabled him to obtain distinction in the domains of archæology, history, and romance. At the outset of his literary career he gained celebrity by his two apocryphal works, by imaginary authors—"The Theatre of Clara Gazul, a Spanish Comédienne" (1825), and "Guzla," a collection of Illyrian songs, attributed by him to Hyacinthus Maglanowich. "The Theatre of Clara Gazul," one of the most perfect examples of literary mystification, precipitated the romantic revolution in France, and, according to the expression of a well-known critic of the time, M. Mérimée was the Mazeppa of an army of which Victor Hugo was the Charles XII. He published afterward, anonymously, the "Jacquerie" (1828), depicting feudal scenes, followed by "The Carvajal Family" and the "Chronicle of the Reign of Charles IX." (1829.) After this date he ventured to attach his signature to his literary productions, of which the following are the principal: "Tamango," "The Capture of the Redoubt," "Venus of Ille," "Souls in Purgatory," "The Vision of Charles XI.," "The Plague of Toledo," "The Game of Trictrac," "The Etruscan Vase," "The Double Mistake," "Arsène Guillot," "Matteo Falcone," "Colomba." These charming stories were published between 1830 and 1840, in the *Revue de Paris* and the *Revue des Deux Mondes*, and afterward collected in volumes. "Carmen" (1847), "Episode of the History of Russia" (1852), "The Two Heritages" (1853), "The Inspector-General" (1853), "Outset of an Adventurer" (1853), are little novels, full of life and interest, and distinguished for their sobriety of style and elegance of language.

His archæological works are the following: "Travels in the South of France" (1835), "Travels in the West of France" (1836), "Travels in Auvergne and Limousin" (1838), "Travels in Corsica" (1840), "Historical Monuments" (1843), "Paintings of the Church Saint-Savin" (1844), in which the wonders of Nature, the marvels of art, and the relics of history, are presented to the reader in the most attractive forms, which seldom fail to excite his interest and sympathy.

His miscellaneous works are: "Notice on the Life and Works of Michael Cervantes" (1828); "Essay on Social War" (1841); "History of Don Pedro I., King of Castile" (1843); "The False Demetrius" (1854); "Historical and Literary Fragments" (1855); "Introduction to the Stories and Poems of Modern Greece de Marino Vreto" (1855); and numerous articles in the *Revue des Deux Mondes*, the *Salon* of 1839, the *Archæological Review*, *Revue Contemporaine*, *Plutarque Français*, the *Globe*, *Constitutionnel*, *Moniteur*, *History of the Villes de France*, etc., equally distinguished for their sparkling wit, graceful humor, elegance of language, breadth of views, and soundness of judgment.

ANCIENT AND MODERN DIVISIONS OF TIME.

IT is not generally known that, a little more than a century ago, New-Year's was celebrated on the 25th of March throughout the British dominions, including America.

The following enactments, adopted by Parliament, entitled "An Act regulating the Commencement of the Year, and for correcting the Calendar in use," were passed in the twenty-fourth year of the reign of George II.:

"PREAMBLE.—Whereas, the legal supputation of the year of our Lord—according to which the year beginneth on the 25th day of March—hath been found by experience to be attended with divers inconveniences," etc.

"Enactments.—That throughout his majesty's dominions in Europe, Asia, Africa, and America, the said supputation, according to which the year of our Lord beginneth on the 25th day of March, shall not be made use of from and after the last day of December, 1751; and that the first day of January next following the said last day of December shall be reckoned, taken, deemed, and accounted, to be the first day of our Lord, 1752, and so on from time to time. The first day of January in every year which shall happen in time to come shall be deemed and reckoned the first day of the year," etc.

The act further corrects the calendar thus:

"And that the natural day next immediately following the 2d day of September shall be called and accounted to be the 14th day of September, omitting for that time only the eleven intermediate nominal days of the common calendar."

We believe that in the State of Rhode Island to this day all farm and other leases date from the day of the ancient New Year, namely, the 25th of March.

The ancient divisions of the day differed widely from the customs of our own time.

The Chaldeans, Syrians, Persians, and Indians, began the day at sunrise, and divided the day and night into four parts. This division of the day into quarters was in use long before the division into hours.

The Chinese, who begin their day at midnight, and reckon to the midnight following, divide the interval into twelve hours, each equal to two of ours, and known by a name and particular figure.

In Egypt the day was divided into unequal hours. The clock, invented by Ctesibius of Alexandria, B. C. 250, was so contrived as to lengthen or shorten the hours by the flowing of water.

The Greeks divided the natural day into twelve hours—a practice derived from the Babylonians.

The Romans called the time between the rising and the setting sun the natural day; and the time in the twenty-four hours the civil day. They began and ended their civil day at midnight, and took this practice from their ancient laws, and customs, and rites of religion, in use long before they had any idea of the divisions into hours.

The first sun-dial seen at Rome was brought from Catania, in Sicily, in the first Punic War, as part of the spoils of that city; and, after this period, they divided the day into twenty-four hours. An officer, called *accensus*, at one time proclaimed the hours, and at the bench of justice announced every three hours the time of day.

In the Turkish empire time is reckoned by certain portions of the natural day, resembling the "watches" of the ancient Jews and Romans. Public clocks not being in use, these divisions of time are proclaimed from the minarets.

SIR JOHN LUBBOCK, BART., M. P., F. R. S.

THE examples of men engaged in regular mercantile business, who give their surplus time and thought to any serious subject with a view of contributing to its original elucidation, or of in any way promoting the real intellectual interests of the community, are so rare, that, when one appears, he is looked upon with astonishment. The common excuse for this is, that business labors are so exhausting that no surplus power is left for solid or systematic mental work in the hours of release from office-duty. But a great deal more is made of this than the facts will warrant. The anxieties of an insecure business may harass the feelings, but the current talk about using up the intellect in commercial transactions is simply nonsensical. The mental effort here required is generally of the lowest and simplest kind—mere automatic, mechanical routine, with hardly enough of real mental excitement to keep the mind from lapsing into stupidity. That the health of business-men often gives way, is true; but it is generally more due to inaction, bad eating, and bad breathing, than to excessive brain-work.

It is pitiable to see a man of good capacity narrowing down his mental action to petty counting-room details, and then offering the need of recreation to an overtasked intellect as an excuse for wasting all the rest of his time in the empty frivolities of sensational literature, pleasures, and social gossip. For farmers and mechanics, who labor regularly with their hands, and in whom muscular exertion draws powerfully upon nervous vitality, there is more excuse for mental inaction; but for the neglect of serious mental work, on the part of men of business, there is no such apology. No doubt, our vicious, classical education, which fails to enforce the duty of mental preparation for useful substantial ends, and makes mental pleasure the end of culture, is largely responsible for this result; but it is none the less deplorable on that account. Let us see what example has been set to us by an English man of business, now but thirty-six years of age, who had every temptation to an empty and aimless life which affluence and high social position can create.

SIR JOHN LUBBOCK was born at Eaton Square, London, in 1834. He is the eldest son of Sir John William Lubbock, the third baronet of that name, and who won a distinguished reputation as a mathematician and astronomer. He wrote on the "Lunar Theory," on the "Perturbations of the Planets," and "Researches on the Tides." Among his numerous scientific productions was a little work on

"Probabilities," which anticipated by many years the now well-known work of Quetelet. It was published anonymously, and long ascribed to Mr. De Morgan.

The subject of our sketch was sent at an early age to Eton, and in 1848, when but fourteen years old, he entered the well-known banking-house in Lombard Street, of which his father was then the leading partner, and in which, during the last two-and-twenty years, he has been an indefatigable worker.

Young Lubbock early developed a fondness for natural history, devoting himself specially to entomology and the study of the structures and changes of the invertebrate animals. His patient, persevering, and careful researches and discoveries in this field, and his

admirable descriptions of his observations, have achieved for him an enviable reputation in the foremost rank of scientific biologists.

But it is in the department of archæology, or the investigation of the most ancient vestiges and remains of man, that Sir John Lubbock has most distinguished himself. His preparation for this field of inquiry was specially fortunate. In the pursuit of ethnology, the advantage of a thorough and direct acquaintance with biological principles, and the benefits of a methodical training in practical scientific investigations, can hardly be overestimated. Thus qualified, Sir John Lubbock has devoted himself to the study of primeval man, by original researches through the whole range of the investigation. In those elucidations he has not only drawn upon all

available sources of information, but he has himself examined the gravel-pits, from Amiens to the sea, in search of all the signs and tokens of prehistoric humanity; he has explored the bone-caves of the Dordogne, the peat-bogs and shell-mounds of Denmark, the lake-habitations of Switzerland, and countless museums, public and private, which are scattered all over Europe. The results of all these laborious inquiries he has given to the world in his splendid volume, entitled "*Prehistoric Times*," of which a new and revised edition will soon be offered to the American public by D. Appleton & Co.

Sir John Lubbock has published numerous original memoirs, of a scientific character, in the "*Transactions of the Royal Society*," of the *Ethnological* and *Linnæan Societies*, and in the *Scientific Review*. His last important work, however, is "*The Origin of Civilization* ; or, the *Primitive Condition of Man*," which has just been reprinted in this

country. How the work is appreciated is shown by the fact that the first edition disappeared in a few days after its issue. Of the character of this volume the London *Athenæum* speaks as follows :

"Such is the summing-up of a work which is most comprehensive in its aim, and most admirable in its execution. The patience and judgment bestowed on the book are everywhere apparent; the mere list of authorities quoted give evidence of wide and impartial reading. The work, indeed, is not only a valuable one, on account of the opinions which it expresses, but it is also most serviceable as a book of reference. It offers an able and exhaustive table of a vast array of facts which no single student could well obtain for himself, and it has not been made the vehicle for any special pleading on the part of the author."

Sir John Lubbock belongs to the school of Darwin, and holds to the hypothesis of development as applied not only to the inferior world of life, but also to man. He believes that the law of humanity is not degeneracy, but progress; not the falling away from a primitive state of perfection, but the gradual amelioration and advance toward a higher and a better condition. His writings upon this subject are pervaded by an elevated and hopeful spirit, of which the following passage, from "*Prehistoric Times*," may serve as an illustration:

"It will, I think, be admitted that, of the evils under which we suffer, nearly all may be attributed to ignorance or sin. That ignorance will be diminished by the progress of science is, of course, self-evident; that the same will be the case with sin, seems little less so.

Thus, then, both theory and experience point to the same conclusion. The future happiness of our race, which poets hardly ventured to hope for, science boldly predicts. Utopia, which we have long looked upon as synonymous with an evident impossibility—which we have ungratefully regarded as 'too good to be true'—turns out, on the contrary, to be the necessary consequences of natural laws; and once more we find that the simple truth exceeds the most brilliant flights of the imagination. Even in our own time we may hope to see some improvement; but the unselfish mind will find its highest gratification in the belief that, whatever may be the case with ourselves, our descendants will understand many things which are hidden from us now, will better appreciate the beautiful world in which we live, avoid much of the suffering to which we are subject, enjoy many blessings of which we are not yet worthy, and escape many of those temptations which we deplore but cannot wholly resist. . . . It may be said that our present sufferings and sorrows arise principally from sin, and that any moral improvement

SIR JOHN LUBBOCK.

must be due to religion and not to science. This separation of the two mighty agents of improvement is the great misfortune of humanity, and has done more than any thing else to retard the progress of civilization. . . . Fully satisfied that religion and science cannot be at variance, I have striven in the present publication to follow out the rule laid down by the Bishop of London (now Archbishop of Canterbury) in his excellent lecture delivered last year (1864) at Edinburgh. 'The man of science,' says Dr. Tait, 'ought to go on honestly, patiently, diffidently, observing and storing up his observations, and carrying his reasonings unflinchingly to their legitimate conclusions, convinced that it would be treason to the majesty at once of science and of religion if he sought to help either by swerving ever so little from the straight rule of truth.'"

Well, is this earnest devotion of thought to the later and larger questions of science incompatible with the duties and cares of business? Far from it. Sir John Lubbock is as successful a man in his bank as in his library. But it is because his training has not been uncongenial with his business. We have yet to learn the vast advantage of a true scientific education as a preparation for practical life. The man of business has to deal with facts, with operations which are governed by laws, otherwise it would be impossible for him to reason from past experience to a future policy. But it is the one great business of science to deal with fact and law, and of scientific education to train the mind to this method of thought. We are, therefore, not surprised to learn, not only that Sir John Lubbock manages his own financial affairs successfully, but that he has introduced comprehensive measures of improvement in the English banking system. In 1865 he published a valuable paper in the "Journal of the Statistical Society," solving two questions to the great importance of which Mr. Babbage had called attention. The first of these had reference to the proportion of the transactions of bankers which passed through the clearing-house to that which did not. Taking an amount of one hundred and fifteen million dollars which passed through the hands of his own banking firm during the last few days of 1864, Sir John analyzed the respective items of clearing-checks, bills, bank-notes, and coin, and found that out of each million more than seven hundred thousand dollars passed through the clearing-house. It was to facilitate this large element of monetary transactions that Sir John Lubbock worked out, and by indefatigable exertions succeeded in carrying into effect, the plan known as "the country clearing," by which great public benefit was secured. The fact that Sir John Lubbock is the chairman of the Association of Bankers, and that he was selected by government to serve on the commission appointed to consider the question of an international coinage, shows what value is attached to his judgment in the monetary world.

Sir John Lubbock is magistrate for the county of Kent, president of the Entomological Society, and vice-president of the Linnean and Ethnological Societies. He has also been appointed by government a member of the Public Schools Commission and of the Royal Commission for the Advancement of Science.

In 1868 he was nominated as a candidate for Parliament from the University of London, backed by a committee consisting of such men as Huxley, Babbage, Tyndall, Airy, Lyell, Darwin, Max Müller, and others. He was beaten; but, in 1870, he was the successful candidate of the Liberal party from Maidstone. He was married, in 1856, to Ellen Frances, only child of the Rev. Peter Harndern, of Lancashire. He succeeded his father to the baronetcy in 1865.

SIEGES OF PARIS.

WHEN Cæsar came first to Gaul, Lutece, or Paris, had no walls, and was merely a cluster of poor huts, defended by a river that wound its way between forest and marsh. In the great insurrection, when the wild Gauls refused any longer to contribute cavalry to the Roman armies, Cæsar, before his defeat in Auvergne and his retreat to Champagne, sent Labienus, his lieutenant, to attack the Parisians. The barbarians on his approach burned their fortresses, destroyed their bridges, forsook their woods, and encamped to the north of the town. In the battle that ensued the Gauls were routed, and their chieftain, Camulogene, slain. In 356 Julian the Apostate cleared Paris and its environs of the hordes of German barbarians who had overrun it for five years, gave the town a municipality, and built the Palais des Thermes (now the Hôtel Cluny). The Roman camp then stood on part of what is now the garden of the Luxembourg.

Lutetia—the favorite city of Julian the Apostate, the pleasant capital of Roman Gaul—was much tormented by those rapacious Danes, who, in the ninth century, came down in hungry swarms from their Northern pine-forests upon the unhappy countries of their choice. In 842, fresh from burning Nantes and spoiling the Saracens of Spain, the Danes rushed on Paris. The river was wider then, and there were but two bridges to the city island, and probably only one gate. The Palais des Thermes was still a noble structure, the great monasteries of St.-Germain l'Auxerrois, St.-Germain des Près, Ste.-Geneviève, and St.-Victor, were castellated fortresses, used as strongholds in such hours of need. On the approach of Regner Lodbrok and his horde, Charles the Bald concentrated his army at St.-Denis, before the abbey (St.-Germain des Près), and opposite to an island of the Seine. The Danes did not attack, but spread over the country, burning and ravaging. The frightened inhabitants abandoned Paris, and on Easter Eve the Danes entered it. The monks had fled with their shrines' relics, the citizens had borne away or hidden their valuables, so the Danes carried off only the iron gates and the roof-beams of St.-Germain, to show as trophies to King Eric of Denmark, and, when the too free use of wine brought on dysentery in their army, they consented to depart on Charles the Bald paying them the enormous subsidy of seven thousand pounds of silver, a sum equal, say the Academicians, to five hundred and twenty thousand livres.

In 857 these pirates were again on the Seine. The monasteries, heretofore sacked, were now destroyed. St.-Denis was burned, and a heavy ransom demanded for the abbot, Charlemagne's grandson. Notre-Dame (then St.-Etienne) and St.-Germain des Près alone escaped. The savages also broke open the tombs of the Merovingian kings, and scattered the bones of Clovis. Even till the era of Louis XIII., a clause was retained in the Ste.-Geneviève Litany, "From the fury of the Norsemen, good Lord deliver us."

These sea-robbers came again in 885. Rollo had then reoccupied Rouen, and advanced on Paris; Sigfried leading their host of forty thousand men in boats and barges that covered the Seine for two leagues. The city was now fortified, a painted bridge stopped their vessels, and the Grand Chatelet was defended by Eudes, son of the Count of Paris. This is the defence that Ariosto has immortalized in his gay and chivalrous verse. A treaty refused, on Ste.-Catherine's Day the Danes fell to it, trying to storm the Grand Chatelet, and wounding Bishop Gauzelaine. The siege lingered on for four years, but the Danes made no great way. One spring the Seine swelled, carried off several piers of the Petit Pont, and opened a way to the Danish vessels, but Bishop Gauzelaine instantly repaired the bridge, and manned an adjoining tower with twelve brave citizens of the merchant forces. The Danes tried to burn the painted bridge with fire-ships, but the bishop sunk them; the tower, however, they burned, and butchered the defenders, who surrendered. Bishop Gauzelaine dying of vexation, the emperor sent a grand army to raise the siege, but the Danes caught the leader, Count Henry, in a pitfall outside their camp, and killed him. Eventually Charles came and gave them a subsidy of fourteen hundred silver marks and Burgundy, which had recently revolted from him. Sigfried was soon after killed in a foray in Holland. The Parisians refusing to allow the Danes to ascend the Seine, the Northmen dragged their vessels round overland; and about fifty years since, says Sir F. Palgrave, a curious Danish boat, hollowed out of a single piece of timber, that had been swallowed up by the silt, was dug up near the Champ de Mars. The Danes lingered for a year or two round Paris, till every stiver of the black-mail was paid.

Paris had then some little rest, nearly a century's repose, till 978, in fact, when the Emperor Otho attacked Lothaire, one of the last of the Carlovingian race, with sixty thousand steadfast Germans. The French refused to fight, all except one knight, who slew a German ritter who rode up in defiance to the Chatelet gate. Enraged at this reticence, Otho ascended the heights of Montmartre, and there sang exulting hallelujahs over the city, having first ridden to the Chatelet, and contemptuously stuck his lance into the door.

The great wars between France and England in the reign of Edward III. originated in Edward's claim to the French throne on the death of Charles IV. Philip of Valois derived his title by being cousin-german to the deceased monarch, while Edward claimed it as nephew of Charles, ignoring the Salic law, which forbade women to ascend the throne, and which debarred his mother, a sister of Charles, from any right. Edward also espousing the cause of a fugitive Count

of Artois, and of Artevelt, the rebel brewer of Ghent, an enemy of France, furnished fresh causes of quarrel where none were needed. As a climax to these sources of hatred, King Edward added this also, that the Emperor Louis, at a diet at Coblenz, put Philip under the ban, and appointed Edward vicar for all lands held by France on the left bank of the Rhine. Chivalrous Sir Walter Manny broke the first spear by attacking Montaigne; the French retaliated by landing at Southampton and pillaging the town. About St. John the Baptist's Day, 1346, says Froissart, King Edward, leaving his brave wife in the care of her cousin, the Earl of Kent, embarked with his men-at-arms and archers at Southampton. The English were to have landed in Gascony, but afterward decided on Normandy, as being fuller of rich towns and handsome castles. The army landed at La Hogue, and took Caen, sacking the place, and obtaining great plunder of rich robes, jewels, and gold-and-silver plate. The English then took Louviers and burned Gisors, Mantes, and Meulan, and pushed forward to Poissy, only seven leagues from Paris. The bridge here being broken down, the patient army remained five days while it was repairing, the knights in the mean time solacing themselves by burning St.-Germain-en-Laye, five leagues from Paris, St.-Cloud, Boulogne (Bois de), and Boissy la Reine. "The Parisians," says the chronicler, "were much alarmed, for Paris at that time was not enclosed." Still the invaders hesitated about marching on, and King Philip, beginning to stir, pulled down all the pent-houses in the city, and went to St.-Denis to meet the King of Bohemia, Lord John of Hainault, the Duke of Lorraine, the Earl of Flanders, the Earl of Blois, and others of his allies and vassals—barons, knights, and lords. The Parisians, hearing he was leaving the city, came and fell on their knees, and said, in the simple-hearted language of those times:

"Ah, sire and noble king, what are you about to do? To leave your fine city of Paris? Our enemies are only two leagues off. As soon as they know you have quitted us, they will come directly, and we are not able to resist them ourselves, nor shall we find any to defend us. Have the kindness, therefore, sire, to remain in your good city of Paris and take care of us."

The king replied: "My good people, do not be afraid; the English will not approach you nearer than they have done. I am going to St.-Denis to my army, for I am impatient to pursue these English, and am resolute to fight without delay."

Soon after this came the English march into Picardy and the great victory at Crécy, where the English heralds counted among the French dead eighty banners, eleven princes, twelve hundred knights, and thirty thousand common soldiers.

In 1357 Paris was enclosed for the first time. The Provost of Paris fortified it with walls and a ditch—employing three hundred masons for a whole year. And the time soon came to test the new walls. The Duke of Normandy, Regent of France, collecting three hundred lances, besieged Paris, on the side of the Faubourg of St.-Anthony, his headquarters being at Charenton and St.-Maur. He held both the Marne and the Seine, allowing nothing to enter the city, and burned all the suburban villages. The city was defended by the King of Navarre, the Provost of Merchants, and some Navarrese English archers. Peace was at last proclaimed, but the provost still intrigued for the King of Navarre, who remained at St.-Denis, and allowed his English soldiers to brawl and riot in the city, where sixty of them were killed in one fray alone. The Parisians arming to retaliate, the English were set upon as they were returning by the gate of St.-Honore, and six hundred of them slain. The provost at last planning to let in the English to sack the city and kill all the regent's adherents, some citizens set upon him on the steps of the fort of St.-Anthony, struck him down with a battle-axe, killed six of his fellow-conspirators, and brought the Duke of Normandy in triumph from Charenton to the Louvre.

In 1359 Paris was again besieged by the English, who had sailed from Dover two days before the feast of All Saints with cries of "God and St. George!" Marching through Picardy and Rheims, they in due course arrived at Monthéry (seven leagues from Paris), and thence sent to Paris heralds to offer battle to the regent, who, however, refused to come outside the walls at a disadvantage. It was at this time that the good knight Sir Walter Manny, eager for lance-breaking, requested the king to let him venture with some new-made knights as far as the barriers of Paris. The son of Sir Nicholas Dambreticourt, a squire of the body, the king had wished to be of the party, but, as the chronicler sarcastically perhaps mentions, the young man excused himself

by saying he could not find his helmet. In these skirmishes many hard blows were exchanged, which ended by a French knight being captured by a stratagem, before the English retreated. An eye-witness says: "No living being to be seen from the Seine to Etampes; all have sought refuge in the three faubourgs of St.-Germain, St.-Marcel, and Notre Dame des Champs. Monthéry and Longjumeau are on fire—all round we see the smoke of burning villages rising to heaven. On Easter-day I saw the priests of ten communes officiate at the Carmelites, the next day orders came to burn down the three faubourgs. Some wept, others laughed. Near Chanteloup twelve thousand persons, men, women, and children, threw themselves into a church, which was burnt by the English, and not three hundred escaped." "I learned," says the eye-witness, "this lamentable event from a man who had escaped through our Lord's will, and who thanked God for it." Paris was in great distress, for Burgundy sent up no more fire-wood, and fruit-trees had to be used for fuel. The English king at last drew off his forces toward the Loire, promising to return to Paris at the vintage. In May, 1361, he made peace on receiving Aquitaine, and a ransom for King John, of three million gold crowns, six hundred thousand to be paid before he left Calais. Paris went frantic with joy at this treaty that saved them, and even presented the English ambassadors with some thorns from the real crown at the Sainte Chapelle. "All rejoice," says the chronicler, "but the armorers. The levied towns and provinces were alone miserable, the Rochelle people saying they would rather pay half their incomes; and adding, 'we may submit to the English with our lips, but with our hearts—never.'"

In those cruel wars which devastated France in the reign of Charles VII., when Burgundians and Armagnacs were more dreaded in Paris than even the English, Joan of Arc, after saving Orleans, making the redoubtable Talbot prisoner, and crowning Charles king of France at Rheims, experienced her first reverse at Paris. Against her wish (for poor Joan after the coronation had fallen at the king's knees and begged him to let her go back to her father and mother, to once more guard their sheep and tend their cattle), the Pucelle led the French troops in August, 1430, to wrest Paris from the English by a *coup de main*. Her angelic voices had warned her to go no farther than St.-Denis. At the first attack she carried an outpost by a rush. She crossed the first fosse, and even the mound that separated it from the second. Finding the second fosse full of water, amid a storm of arrows she called for fascines and began sounding the water with her lance. Just then, as she stood there conspicuous, an English arrow pierced her thigh; she strove to resist the pain and to urge the troops to the assault, but, faint with loss of blood, she at last sought the shelter of the first fosse, and late at night was persuaded to return to the camp. But fifteen hundred were killed or wounded in this attack, and the army accused La Pucelle of imprudence, and believed her justly punished for her impiety in giving the assault on the anniversary of the nativity of Our Lady. Soon afterward the brave girl was stricken from her horse at the siege of Compiègne, sold to John of Luxembourg, and cruelly burnt alive. It was not till April, 1436, that the brave Breton Constable of France, Count de Richemont, and the gallant Dunois, immortalized by both Shakespeare and Schiller, took Paris from the English, and put the garrison of rough invaders to the sword.

Another lull till 1465, when the proud and warlike Count of Charolois, afterward Charles the Bold, Duke of Burgundy, whom Sir Walter has sketched in such a masterly way in "Quentin Durward" and "Anne of Geierstein," invested Paris, in order to bring his deadly and wily enemy, Louis XI., to terms. Commynes, who was with the duke, computes his army of German cross-bow men, Neapolitan horse-men, and Swiss halberdiers, at one hundred thousand men. They routed a handful of French archers at Charenton, and, passing over the bridge there, encamped at Conflans, beside the river, enclosing their army with wagons and artillery. While the scared citizens were still hesitating about an armistice, the subtle king slipped into Paris with two thousand men-at-arms and half the nobility and volunteers of Normandy, and lent new vigor to the sallies on the Burgundian foragers. The enemy not having blocked the three rivers, Marne, Yonne, and the Seine, provisions were plentiful in Paris. "In a word," says Commynes, "Paris is surrounded by the finest and most plentiful country I ever yet beheld, and it is almost incredible what vast quantities of provisions are brought to it." The Parisians made frequent sallies, and in many a warm skirmish drove

back the Burgundian outposts of fifty lancers at Berey. The ladies of Paris, being spectators, roused the chivalry of the twenty-five hundred men-at-arms who helped to defend the city. One day, particularly, four thousand of the king's Franc archers (young Quentin Dureward was perhaps among them, and certainly grim old Balafré) came to Charenton, threw up a barricade, dug a trench, and began to cannonade the Duke of Calabria's quarters on the opposite side of the river, even killing a trumpeter who was bringing up a dish of meat to the Count de Charolois. The Burgundians instantly mounted their cannon (all but their cumbersome bombards) along the river wall, and gave tongue, having either sheltered themselves in a convenient stone quarry, or dug pits before their tents. During this temporary success, half Paris came out to have a safe peep at the enemy. The Burgundians then made a bridge of planks laid on barges, broad enough for three men abreast, and at daybreak passed over; but on a sudden the men in the trenches shouted, "Farewell, neighbors, farewell," and, setting fire to their tents, drew off in a huge cluster toward Paris. The king, says Commynes, did not dare attack in force, being suspicious of some of his officers, having indeed one night found the gate of the Bastille (of St.-Antoine) toward the fields left open. At the grandest sally there were to be three attacks; one a general sortie, the second at the bridge of Charenton, the third with a brigade of two hundred men-at-arms from the wood at Vincennes. At daybreak, when the attack opened, the Burgundian army sprang in a moment to arms, and a hot cannonade began on both sides, though the walls of Paris were a good two leagues off; the count's scouts in the mist mistook a field of tall thistles for the king's lancers advancing in force, much to the amusement of the rear-guard. Peace was soon after proclaimed; Louis, for two hundred thousand golden crowns, giving up to the duke Amiens, Abbeville, and other fortresses on the Somme. The Burgundians were, however, again shaking their lances at Paris in 1465; they attempted to surprise the gate of St. Denis, but, being repulsed at the barriers, they cannonaded the town; and during this attack, says Jean of Troyes—the supposed author of the "*Chronique Scandaleuse*"—a cowardly rascal of a bailiff frightened the citizens almost into fits by running up and down, shouting at the top of his voice, "Get into your houses, O Parisians, for the Burgundians have entered the town!" Louis, arriving just as the count had stormed St.-Cloud, fell on the Burgundians at Mont Chery, defeated their vanguard, and captured their baggage. The Bretons and Burgundians, during this siege, cut down ruthlessly all the vines at Clignancourt, Montmartre, and St.-Courtille, and made wine of the green grapes; and the Parisians, to save the fruit, did the same to all the other vineyards. During this danger the citizens of Paris barricaded their streets with chains, as the Provost Marcel had first done during the Armagnac and Burgundian troubles of 1356; great bonfires were burnt nightly in every ward, and watch was kept all night at the Hôtel de Ville. Louis XI. again temporarily bought off his enemies by concessions of money and territory, and so the war ended. According to Dulaure's calculation, there were at this time only about one hundred and fifty thousand souls in Paris.

After Henry IV. had stricken down the insolent Spaniards and the fanatic Leaguers at Ivry, he invested Paris. Choosing a dark night, he told off twenty divisions, to carry at the same time the suburbs of St.-Antoine, St.-Martin, St.-Denis, Montmartre, St.-Honoré, St.-Germain, St.-Michael, St.-Agnes, St.-Marceau, and St.-Victoire, in order to cut off all supplies from Paris. "I wish for peace," said the king; "for a battle I would lose one finger; for a general peace, two. I love my city of Paris: she is my eldest daughter. I am jealous of her. I am desirous of doing her service, and would grant her more favors than she demands of me; but I will not be compelled to grant them by the Duke of Mayence or the King of Spain." Henry, attended by his wise favorite Sully, who had been severely wounded at Ivry, and by his secretaries and physician, sat at one of the windows of the Abbey of Montmartre, and watched the two hours' cannonade, and the flames that sprang up with horrible rapidity in a hundred different directions. The Duke de Nemours, who defended Paris, defended it well, nevertheless. Thirty thousand poor wretches died of hunger in the space of a month; mothers fed upon the flesh of their children, and, by the advice of the philosophic or fanatical Spanish ambassador, the citizens even dug up dead bodies, and pounded the bones into a kind of horrible dough, which generally caused the death of its consumers. The half-starved people fought with fury; even the Capuchin and Carthusian monks put on armor over their frocks, and fought be-

side the citizens. Sully, however, says the city could never have held out if the king's officers had not allowed provisions to pass in exchange for scarfs, plumes, silk stockings, sashes, gloves, and beavers, that they wanted from within. Eventually, either owing to hopelessness or fear of the cruelty of his Huguenot soldiers, Henry IV. raised the siege, and retired to Challes, a town between Paris and Meaux, where the Duke of Parma (grandson of Charles V.) was encamped, and soon after retired to the castle of Creil, on the Oise.

This was, no doubt, a discomfiture, though Sully colored it over: but in 1594, Henry fairly bought his capital of the League governor, the Count de Brisac, for one million six hundred and ninety five thousand four hundred livres. The royal troops were admitted by the Porte Neuve, at the Quai du Tuileries, which had been banked up, the Porte St.-Honoré, and the Porte St.-Denis. The cannon on the ramparts were at once turned on the city. Soldiers from Corbeil and Melun landed at the Quai de Celestins. Some German soldiers who resisted at the Quai de l'École, were killed and thrown into the Seine. The Leaguers in vain endeavored to save the Temple. The agitators excited the people in the University quarter, but a lame-legged captain, falling down and breaking his wooden leg and musket, covered with an air of ridicule the whole *émeute*. From a window near the Porte St.-Denis, the king himself shouted to the Spanish soldiers as they left the city, "Gentlemen, commend me to your master, but never return here."

But the siege that after all more nearly concerns us, and was attended by events that bear more resemblance to what may soon happen, was that conducted by the allies in March, 1814. A short narrative of this one day's siege will have a special interest to most of our readers at this moment. The allies, eager to revenge the losses of Marengo, Jena, and Smolensko, took an ungenerous but not unnatural advantage of those disasters of Napoleon that had culminated at Beresina and at Leipsic, and crossed the Rhine, mustering with their reserves scarcely less than half a million of men. The emperor, with a genius soaring above all dangers, concentrated eighty thousand men at Chalons, and ordered a levy of two hundred and eighty thousand fresh conscripts, intending to form three camps, one at Bordeaux, a second at Metz, and a third at Lyons.

The grand running fight which the emperor carried on through Champagne ended in his being frequently overpowered by his relentless enemies. Unwilling to be crushed between Blücher's and Schwartzberg's divisions, he at last retreated, hoping to be joined by Suchet's army from Catalonia, and Augereau's regiment from Lyons, and then to hurry back and defeat his enemies under the very walls of Paris. In the mean time, as Marmont and Mortier fell back to the capital, the allies approached the gay city by three routes, Meaux, Lagny, and Soissons. The preparations in Paris for real defence had hitherto been but slight. Napoleon had either never relied on the luxurious and excitable people of the capital, or, what is more likely, had, like his nephew, been afraid to trust them with arms. There were two hundred cannon at Vincennes intended for the heights, but they were not yet mounted. No barricades had been thrown up in the streets near the Octroi wall. Of the thirty thousand National Guards, not more than six thousand had been provided with muskets. The redoubts before the gates were mere "tambours" of palisades, and without moats. The fifty or sixty thousand volunteers with fowling-pieces that could have been mustered had not been called upon. Paris was not yet fortified, and all was excitement, confusion, and distrust, while the actual reliable soldiers did not number more than twenty-five thousand men.

On the 29th of March the allied sovereigns met at the Château of Bondy; and, dreading the tiger-like rush of Napoleon, resolved to at once storm Paris, and by the right bank of the Seine, so as not to have to recross the river if repulsed. There were to be three simultaneous attacks. On the east (the German side), Barclay de Tolly, with fifty thousand men, was to march by Passy and Pantin, and carry the plateau of Romainville; on the south, the Prince Royal of Würtemberg undertook, with thirty thousand Germans, to break through the wood of Vincennes, and to reach the barriers of Charonne and du Trône; the third attack, on the north (the English side), was to be led by grim old Blücher himself, who was to force his way through Mortier's grenadiers and over the plain of St.-Denis.

On the French side, Marmont took Vincennes, the Barriers du Trône and Charonne, and the plateau of Romainville as far north behind this plateau as Près St.-Gervais; while Mortier defended the plain

of St.-Denis and the space round the Canal of the Ourcq. The Russians won the first move. Misled by an officer, Marmont was mortified to find the Russians already in possession of Romainville. With twelve hundred men of the Lagrange division, however, he threw himself on their rear-guard, and drove them hotly back on Pantin and Noisy. At the same moment the Ledru des Essarts division swarmed hotly into the wood of Romainville, whose heights border the plain of St.-Denis. Marmont then distributed his troops. The Duke of Padua placed his men on the extreme edge of the plateau of Romainville, in the tallest houses of Bagnolet and Montreuil, where the gardens slope down toward the city. In the centre of the plateau Marmont drew up the Lagrange division, backed by the houses of Belleville, while the Ricard division was in the wood of Romainville on the left, and to the north the division of Ledru des Essarts. At the foot of the plateau, in the plain at Près St.-Gervais, stood the Boyer de Rebeval division, while the Michel division guarded La Grande and La Petite Villette. The cavalry was posted between Charonne and Vincennes. About eight o'clock, Joseph, posted safe like Jupiter in Montmartre, heard the musketry begin to rattle.

The brave Livonian, Barclay de Tolly, vexed at being pushed out of Romainville, called up his reserves to retake it. Paskiewich's grenadiers were to scale the heights on the Rosny side, while Count Pahlen's cavalry attacked on the south from Montreuil. At the same time Prince Eugene of Würtemberg was told off to attack Pantin and Près St.-Gervais to the north, and to contribute to the recovery of the important post of Romainville. The Russian attack prospered. General Meyerzoff, who had been repulsed in the morning, forced back Lagrange, and wrested from him the heights. The Russian brigade also turned the plateau by Montreuil and Bagnolet, and the Duke of Padua, being outflanked, was driven slowly but surely backward. At the same time the Russian cuirassiers, storming along the plateau, charged the French infantry, but were repelled by the drifting fire. At Belleville, too, the narrower plateau gave the French, by concentration, greater strength. The tirailleurs threw themselves for cover behind the houses of Bagnolet, and found shelter in the wood of Romainville. The French batteries, though served for the most part by mere lads from the Polytechnique, kept up a relentless fire that drove the gray-coats backward, at the same time Ledru des Essart's Young Guard won back, tree by tree, the wood of Romainville, and outflanked the Russian force. At the foot of the plateau, the French still held Pantin and Près St.-Gervais, and repelled all efforts of the Prince of Würtemberg to win them back. If the French had now got but eleven thousand more men, their historians say, the allies might have received a severe check; but they had not.

The other attacks were now commencing. Blucher was on the plain of St.-Denis. Langeron had driven through Aubervilliers nearly to the Bois de Boulogne. He then sent his Prussian and Baden guards to help Prince Eugene to carry Pantin and Près St.-Gervais. The Prince Royal of Würtemberg was also moving forward to the south by Neuilly and the forest of Vincennes.

The allied forces were now in line. To the north Prince Eugene, backed by Prussian bayonets, fell fiercely on Pantin and Près St.-Gervais, and tried his best to drive out the Boyer de Rebeval divisions and the Young Guard. Slowly but surely Romainville was won. The Russians, though at first repulsed, at last seized Montreuil and Bagnolet, and took possession of the nearest houses of Menilmontant, and the Duke of Padua was outflanked on the French left. The Ledru des Essart division was beaten from tree to tree out of the wood of Romainville, which they had so lately conquered. Pressed on both flanks and enveloped in fire, Marmont struck a brave blow for life and for victory. Throwing his troops rapidly into four massive battalions formed in column, he rushed like a sword-fish at the Russian centre. Twelve cannons loaded with grape welcomed the fierce assailants, and at the same moment the Russian grenadiers pressed upon his front, while Miloradovitch's heavy cavalry hewed at his flank. The French columns bent, wavered, and retired before these myriads; but a brave fellow, named Ghesseler, breaking with two hundred men from a wood, gave time to Marmont to retreat toward Belleville. The game was all but played, the struggle all but over. Everywhere the French were outweighed and retiring. The wood and plateau were now both lost. The centre stood near Belleville, maimed and enfeebled. The Padua division was at Menilmontant. The Michel and Boyer divisions battled still, but almost hopelessly, for Pantin. In the plain, too, there was tough fighting; La Villette and La Chapelle were both assailed.

General Billiard's cavalry was keeping Blucher's dogged squadrons at bay. It was at this crisis that General Dejean arrived from Napoleon, and cheered on the men for a last rush by the enormous and reckless lie that the emperor was almost in sight, with a force of six hundred thousand men. There was some hope still at Vincennes. A battery, nobly worked by Polytechnique lads, advancing too far from the Barrier du Trône to play on Pahlen's cavalry, got cut off by some German cavalry, and were only saved by their own steadiness and a dash of some national guards and dragoons, who would not leave them to perish. Belleville, the key of the height, still held out; and there Marmont had concentrated his field-artillery and the wrecks of his shattered divisions, sending word to scared Joseph, like an obstinate old soldier that he was, that as yet he saw no reason for surrender.

But the end was now near. Schwartzenberg, dreading every moment to see the flash of Napoleon's bayonets on the eastern horizon, ordered a general attack. Five columns (north and south) were to cut off Belleville from Paris. Brigadier Paisch, with eight heavy guns at Menilmontant, four more at Belleville, and eight on the Butte de Chaumont, received them with a mowing fire, but nothing could stop such deluging masses; they were everywhere superior, and Belleville fell. Mortier, afraid of being cut off, then collected all his forces, charged on the Russians, already entering the Temple Faubourg, drove them out, and resumed the defence of the Octroi wall. In the mean time another division, fighting desperately on the plains of St. Denis, was jostled back to the barriers, while Langeron took the now undefended Montmartre, and marched on the Clichy barrier, held bravely by Marshal Moncey. Marmont, unwilling to see the city destroyed in a useless defence, now proposed terms, and surrendered the city to the allies. Thus, with a total loss of sixteen thousand men, fell Paris after one day's hard fighting.

Paris is now far stronger than in 1814; and, instead of a few contemptible redoubts and one hundred guns, has twelve leagues of wall and sixteen citadels. Instead of thirty thousand men, she has at present, by the most trustworthy accounts, sixty thousand soldiers, one hundred thousand Gardes Mobile, one hundred and ninety thousand National Guards, nine thousand volunteer Franc-Tireurs, and ten thousand auxiliaries from the municipal services. The reliable defenders of the city are computed by General Trochu, a cool and determined man, at four hundred and ten thousand armed men, and much may be expected from the rage and despair of such a multitude, even though two-thirds of them are young recruits. Still we do not think that Paris will rival even Sevastopol, much less Troy, Numantia, or Saragossa. Yet there are certainly elements of strength unknown in 1814. The population, then only seven hundred thousand, is now one million six hundred and ninety-six thousand. The whole twenty-two miles of ramparts only require one hundred and fifty thousand men to man them; and, if the total number of guns required, thirty-six hundred and forty (the allies of 1814 only took one hundred), have really been mounted, and the thirty-six entrances hitherto left open have been well fortified—if there is no treason, internal insurrection, or panic—Paris may still make a bloody resistance, and many thousands of Prussians may perish before its bastions, even in the few days of storm that we expect. The rain of fire and iron must soon, we fear, descend upon the fair siren of cities. God grant her days of suffering may be short, and that the sunshine of peace may follow speedily the cruel tempest!

WALTER THORNBURY.

SONNET.

AS some lone hermit of the days of old,
Couched in his cave, through fancy's brief excess,
Might once have dreamed of far-off loveliness,
Sheen of bright eyes, and veils of woven gold,
Thus, from my desolate Thebaid I behold
The flower-like dawn of this, thy wedding-day,
Which keen October turns to maiden May,
Her sweet lips tremulous with a bliss untold;
Thine eyes, O friend, are touched to tender tears,
While wingéd hopes and blessings fly to place
Aërial garlands on her brow of grace,
Whose love binds up thy bloomless broken years,
Till life made whole, all pure of pain and fears,
Beams in the sunshine of her heavenly face.

TABLE-TALK.

OUR best American artists complain indignantly of the incapacity and impertinence of most of the art-critics who write in the newspapers. They allege that these critics are generally wholly incompetent to judge of the merits or demerits of the works which they praise or condemn with such a lordly air of superiority, and that, with all their skill in the use of words, they have little or no conception of the means employed by the painter, or of the legitimate objects and aims of art. This being the settled opinion of the whole profession, it seems to be clear that there must be foundation for it. The artists themselves are certainly the best judges of works of art, and in their opinion the criticism of the newspapers is contemptible, because ignorant or malicious. At least, so far as we have had an opportunity to observe, this is the unanimous verdict of the studios, which would hardly be the case if the critics were really competent judges. We believe it is only in New York and Boston that art-criticism is written by men who have never practically studied painting or sculpture; and it is only in newspapers that non-professional criticism is dreaded, or has the least effect. All the best French and English art-critics have studied painting as painters, or they have passed the best part of their lives in the society of painters. Hazlitt was for several years a painter, so likewise was Gautier; and Hazlitt, in England, and Gautier, in France, have written the best about painting. We are led to make these remarks by the reception which the newspaper press has given to the fall exhibition of the Academy of Design in this city. A leading journal, for instance, devoted considerable space to a criticism of the exhibition, and yet its critic failed to mention, and probably even to observe, that one of Jules Breton's pictures, the one best known by artists and the least known by the public, was to be seen in the large gallery. It is a picture from which to date a new style in art, and is universally recognized by painters as a natural and delightful work, broad and sunny in effect, bold and firm and fine in style, and admirable in action and color. A peasant-woman walks by the side of a little wagon which holds her child, while her boy tugs it along the road; back of the group the ripened grain ripples against the sky, and, in the distance, the tower of a church makes a gray spot against the light. This is just one of those admirable specimens of the art of painting by the side of which all spoken or written expression seems faint and dull. With such a picture, how can the exhibition be said to be poor? But this is not all that is to be seen there, though it is alone enough to compensate one for an hour spent at the Academy galleries. Whoever may be interested in powerful brush-work, whoever cares for painting, will find much to interest and instruct the eye at the Academy. American art is more or less well represented by Inness, Page, Brevoort, Gay, Coleman, La Farge, Homer, Gray, and Huntington. These names indicate in part the measure and character of the interest of the exhibition. The pic-

tures of May, Bougereau, Wappers, and Reingnault, must suggest the best that comes to us from Europe. We find exaggeration and power in the foreign pictures. They are superb as mere pieces of painting; they burst out upon the spectator, and, among the tender flutones of American art, seem like the blare of trumpets expressing tumult and fury. Yes, even at the Academy, that dull and monotonous place according to some, enough bold and fine, if not beautiful art may be seen to awaken a glow of sensibility, and stir the imagination with the expression of Life and Nature. Reingnault's superb example of powerful use of the brush, and Bougereau's dramatic group, "Orestes pursued by the Furies," can hardly face an indifferent spectator; the latter picture, we believe, has excited general attention. And naturally enough, for it is horrible and awful in contrast with the mild and undramatic forms affected by American art. It is not a creation; it bears too many traces of the studio-model to win the highest tribute, the tribute it would compel had the subject been presented by a Delacroix. But, as a powerful example of academic art, treated in a naturalistic, and, in some respects, a realistic spirit, it must be accepted as one of the most remarkable pictures ever seen on the Academy walls. It is singularly strong in expression, and, though earthy and materialistic, it is, pictorially speaking, tremendously expressive of the subject. American artists have very little to do with antique subjects, and, owing to the geographical position of most of them, it is well they do not attempt to treat such subjects, although it was the fashion among them to do so a quarter of a century ago. France has paid the best tribute to the myths and legends of the ancient world, and has done the most to revive the Greek and Roman types now sheltered in museums and libraries. It is worth while, however, even for us, in our purely modern life, to think of and see the typical and tragic forms that were as familiar to the ancients as Rip Van Winkle is to us.

— Alexandre Dumas, the famous French author, died at Dieppe, about the middle of December, at the age of sixty-seven. His grandmother was a full-blooded African, and his father a mulatto, born in Hayti, but educated in France, who entered the army and rose to the rank of general. Alexandre began his literary career by writing poetry and plays. Some of his dramas were very successful, and are popular on the stage of every country in the civilized world. He began to write novels in 1835, and has published more than we can remember, his best being "Monte Cristo," "The Three Guardsmen," and "Margaret of Valois." The most striking peculiarity in the character of this singular personage was his sublime egotism. Ten years ago, said he: "There are three men who stand at the head of French literature—Victor Hugo, Lamartine, and myself." In this sentence we can only find one thing to wonder at, and that is that he did not put the *moi-même* first. On this occasion the authorities had forbidden the representation of one of Dumas's dramas; but, far from wounding the feelings of the dramatist, the edict only had

the effect of drawing out a witty and presuming letter, which created such a sensation that in the end the injunction was removed, and the play made an immense and astonishing success. To Americans, such gross egotism is not only repugnant, but absurd. Here, in short, self-assertion is self-condemnation. But from the pen of a Frenchman—above all, from the pen of M. Dumas—the expression was in keeping with the French character and the character of the man. The successive schools of literature of France were like those of England. The age of Louis XIV. may be placed side by side with the age of Queen Elizabeth, in the richness of its mine of letters. There naturally followed a decline from so much literary grandeur; for Corneille, Racine, and Molière, had worn out the resources of the time, and left to those who followed them compositions which could only be imitated, not approached. A new era was begun with the Revolution. De Staël and many others sprang up. But, in the language of the author of "Les Misérables," a political revolution must produce a revolution in letters. The end of the Reign of Terror brought to completion the absolute change which began with Madame de Staël. Victor Hugo, Lamartine, Alexandre Dumas, George Sand, Edmond About, and Michelet, headed the school of romance; Béranger, Hugo, and Lamartine, the list of poets; Thiers, Lamartine, Michelet, and others, the roll of historians. Much has been said of Dumas's "Antony." It came out of the Revolution. He was professedly a liberalist in politics, and so did not fail to embody his ideas in his works. Yet the "Catiline," which was brought forth afterward, contrary to expectation, achieved a success greater still. What he anticipated accomplishing in this, and in all the works, in fact, of similar tendency, is shown in the preface to "Caligula." He observes "that antiquity, as it is displayed in the tragedies of Voltaire's school, had fallen into such utter discredit that the sense of weariness with which it affected us had become proverbial. It was nothing at all new that I was about to attempt; it was simply a restoration." At the time much was said of the ingenuity with which Dumas treated the arch-conspirator of the old Roman republic. Full thirty characters were introduced on the stage, by which he intended to typify the leading public men of his own period, and he did not hesitate to acknowledge that the tragedy was *altogether* a portrait of modern French opinions, principles, and parties. Sylla was Napoleon; Cato and Cicero, conservatives; Cæsar, the *éminent* of the day, and partisan double-dealer; Lucullus, the *bourgeois* office-seeker. There were also other appropriate *dramatis personæ*, to represent the Parisian *lorette* and her followers. The character of Catiline was done by M. Méligne, who was, in stage-phrase, at that time "leading man" at the Théâtre Historique. The most successful dramatic works of M. Dumas, since the last thirty years, were "Mademoiselle de Belle-Isle," in which Mademoiselle Mars, the Déjazet of that period, appeared, undertaking at the age of sixty-five the part of a girl of twenty; the "Mariage sous Louis XV.," the "Demoiselles de St.-Cyr," the "Comte Hermann," and "La Conscience."

— In a novel now publishing in a Boston periodical, one of the characters, an American, addressing Americans, speaks as follows: "I can't account for the sparseness of our crop of great intellects. I sometimes fear that our long backwoods life has dwarfed the national brain, or that our climate is not fitted to develop the human plant in perfection. Our painting can't get into European exhibitions. Our sculpture has only done two or three things which have attracted European attention. Our scientific men, with three or four exceptions, confine themselves to rehearsing European discoveries. Our histories are good second class; so are our poems, the best of them. Even in novels—one would think we might do something there; we have a wealth of stirring incidents and curious characters—but what is the result? The American novelist either can't draw a character, or he can't make a plot. In general he is as dull and dry as a school-geography. I don't understand it." These utterances come from one who is described as "well-balanced," and "chilling" his companions by his "rational conversation and sound example." Hence it was not written as the extravagant expression of a loose talker, but is given as the sound opinion of a dispassionate mind. There is some small show of truth in it, it must be admitted, but its exaggerations and errors would not be worthy of attention were it not for certain significant omissions which may, with good advantage, be pointed out. This "sound" and "rational" depreciator of American genius is utterly silent upon that branch of effort in which our national intellect has attained its greatest triumphs. In jurisprudence American writers have a reputation second to none in the world, and in some branches of this science they have foremost rank. The fame of Story, Kent, Wheaton, and a few others, is very high in Europe; and the whole body of our Commentaries is in nowise inferior to the similar productions of other countries. A little analysis will show that our national intellect is not inferior, but that circumstances have directed it into special channels. With us literature is not yet a regular pursuit. In almost every family young men of marked talent are encouraged to adopt the study of law, for this profession, above all others, offers opportunities for men of ambition and genius. And then our national talent is in this direction. As early as 1775 Edmund Burke pointed out the fondness of the American mind for the study of law; and, from that early period to this, our practitioners as well as our legal writers have exhibited a skill that has made them famous. The rewards of literature or art are precarious, and usually with us almost the last thing a man would educate his son for would be either of these professions. Literature is commonly pursued incidentally to something else. If its emoluments were as great, and its position as fixed and certain, as law or any of the recognized professions, it would be more cultivated, more studied, more systematically pursued, and, of course, with greater results than now. The measure of the intellect of a country is not the measure of what it has accomplished in certain arbitrary directions, but the measure of what it

has wrought in those fields to which the character of its genius tends.

— Engraving on steel in pure line is an art almost passed away. Among the numerous prints gathered in such art-rooms as Goupil's or Schaus's, the visitor can discover only occasionally one that is not at least in part executed in mezzo-tint, stipple, or by some other rapid or inexpensive method. Landscapes are commonly etched, and this process is suitable and proper for subjects of this character. But figure-subjects, or portraits, have a special value engraved in line. In America, of all the innumerable portraits on steel that are issued from the press, we know of but very few, with the exception of the heads on bank-notes, which are executed in line. Some dozen years ago, the most accomplished of engravers on bank-note heads was Mr. William E. Marshall. Encouraged by the applause with which his efforts in this way were received, he engraved a portrait of Fenimore Cooper, of a size about four times that of the bank-note heads. This was a success. Fired now with ambition, he determined to attempt at once a large head, and the result was that portrait of Washington now known all over the country as "Marshall's Washington," and which has received the approbation of the best critics in the world. These were followed by heads of Lincoln and Grant, both standing acknowledged as not merely the best portraits of these eminent persons, but as works of art of the very highest execution, such as no European burin has excelled. These triumphs have not satisfied Mr. Marshall. He is now devoting all his energies to the execution of a head of Christ, which he hopes to make the acknowledged greatest work in line the century has produced. The size will be large, covering something over five hundred square inches. He has already been two years upon the work, and has given the profoundest attention to the character of the head. To produce a portrait that shall express the gentleness and yet the strength, the ideal purity and yet the human sympathy of the character, so that all men may say, "This is the Christ," has been his enthusiastic purpose. The drawings and sketches for this ambitious work, which we have been permitted to inspect, impress us as giving promise of a great triumph. Mr. Marshall's execution of his work would be sure to be admirable; it was only necessary that the conception of the face should meet with the exacting demands of such a subject. To our minds, this has been done; for, while no doubt a difference of opinion as to many points will be certain to ensue, yet we believe that it is a face coming very near, indeed, to the ideal of Christ, and one which will stir the admiration, freshen the love, and profoundly move the emotions of every one looking upon it.

— A European correspondent of the JOURNAL, a man of scientific note, sent to us, a few weeks ago, some curious citations from the writings of eminent European naturalists on the interesting question of the mixed races of mankind, in which views were expressed differing from those entertained by most American writers on ethnology. These views, however, seem to be formed from theory, and not

from practical observation, and, at any rate, apply only to the tropical regions of Spanish and Portuguese America, to which we should hardly look for the best specimens of the white race. In our own country, those who have had the best opportunities of observation are, with scarcely an exception, decidedly of opinion that the European notions on the subject are erroneous. Such, at least, is the conclusion of a correspondent in Georgia, who has paid particular attention to this question, and who gives, as the result of forty years experience of the Southern mulattoes, the following statement: "In nine cases out of ten the hybrid proved totally unfit for field-work, the females invariably so. They could not stand excess of heat or cold, were liable to headaches and inflammatory diseases in winter, and were exhausted and worn out long before the muscular vigor of the pure African was at all impaired. In fact, to the latter they were constant subjects of ridicule and contempt. It is generally supposed that they were superior to the negro in intellect; but I doubt it. That they furnished any apparent evidence of superiority is owing, I think, to the fact that, from necessity as well as choice, we took them into our families as body and house servants, and thus, from constant contact with persons of intelligence, they were able to exhibit a little superiority over those who did not possess such advantages."

— Dr. John Lord, who for a quarter of a century has enjoyed a very high reputation as an historical lecturer, purposes to give, this winter, a series of twenty-five lectures "On the Men and Women who for the last Five Hundred Years are most identified with the Progress of Society." The series will be given in the mornings at the Association Hall, and are designed for people generally of leisure and culture, but more especially for young ladies, who, having completed their ordinary education, may be desirous of pursuing a course of historical reading. We commend this series of lectures, particulars of which can be learned at Mr. Putnam's book-store, Association Building, to the attention of all ladies and gentlemen of cultivation.

Literary Notes.

WE have a new volume of poems, by Jean Ingelow, entitled "The Monitions of the Unseen, and Poems of Love and Childhood." For sweetness, grace, and delicacy, Jean Ingelow leads all her contemporaries, and, even if her reaches of philosophy are not the highest, there is in all her teachings the beauty of wisdom and the tenderness of human sympathy. "The Monitions of the Unseen," the leading poem of this volume, is ambitious in purpose; it tells of a curate who, impatient at the little good his earnest efforts seem to avail in his struggle with the wickedness and suffering around him, rebels that—

"God, who loves the world, should yet
Let it lie down in sorrow, when a smile
From Him could make it laugh and sing."

and is visited by the vision of a child, from whom by various ways he at last learns that he is—

"not bound to make the wrong go right.
But only to discover, and to do
With cheerful heart the work that God appoints."

Of the minor poems in the collection many are admirable, and all have some special grace or felicity. The volume is handsomely issued by Roberts Brothers, Boston.

"School-days at Mount Pleasant," by Ralph Morley, is a book of school life and adventures, similar in design to the famous "Tom Brown at Rugby." Mount Pleasant is a military school at Sing Sing, on the Hudson. The narrative carries the reader among the Highlands, and to many localities famous in song, story, and history. The exploits, the escapes, the mishaps, the adventures, jocular and serious, of the young cadets at Mount Pleasant are agreeably and often spiritedly told. Stories of school-life, if at all well related, have a singular fascination to most readers, and this narrative will recall many experiences, and renew, in imagination, not a few of those boyish delights that to so many of us are now gone forever.

Messrs. Sheldon & Co. have published a translation of Victor Hugo's "The Destroyer of the Second Republic, being Napoleon the Little," which was first issued in 1852. The work is now timely, and will be read with vivid interest. It is characterized by the author's merits and faults. It is often eloquent, always dramatic and stirring, sometimes a little blasphemous, and, as in all of Hugo's productions, is marred by excessive egotism and not a few absurdities. Many of its predictions, that would have seemed ridiculous six months ago, are now verified by recent events.

"Our Poetical Favorites" is a new collection of some of the best-known minor poems in the English language. There is no attempt at classification, but the poets have been drawn upon freely and without order for their favorite verses. The collection is made by Professor Kendrick, of the Rochester University, who is himself a poet, as well as one of the most accomplished of American scholars.

Miscellany.

Buckstone's March to London.

WE might seek far ere we found a better illustration of the vicissitudes of an actor's life than that supplied in Mr. Buckstone's march to London in search of fame and fortune, a story best told as it was told by his own mouth: "I once walked from Northampton to London, seventy-two miles, on fourpence-halfpenny. I had a companion in the same plight; and, on comparing our pecuniary resources, we discovered ourselves to be masters of the sum of ninepence—fourpence-halfpenny each, according to Cocker. My costume consisted of a threadbare whity-blue coat with tarnished metal buttons, secured to the throat, because I wore beneath what we call a 'flowered' waistcoat, made of glazed chintz of a very showy pattern, generally adopted when playing country boys and singing comic songs—which at that time was my vocation. I will not attempt to describe my hat; while my trousers must only be delicately alluded to, as they were made of what was originally white duck; but as they had been worn six weeks, and had been much in the fields, there was a refreshing tint of a green and clay color about them, which imparted to that portion of my attire quite an agricultural appearance. I carried a small bundle. I will not describe its entire contents, but may mention that it held a red wig and a pair of russet boots. Under my arm was a portfolio containing sketches from Nature, and some attempts

at love-poetry; while on my feet, to perform this distance of seventy-two miles, I wore a pair of dancing-pumps, tied up at the heels with packthread. Thus equipped, I started with my companion from Northampton, and before breakfast we accomplished fifteen miles. When we sat down to rest ourselves under a hedge by the roadside, we felt very much inclined to partake of the meal in question, but were rather puzzled how to provide it. Presently a cow-boy appeared, driving some lazy, zizzag-going cows, and carrying two large tin cans containing skimmed milk. We purchased the contents of one of the cans for a halfpenny; a cottage was close at hand, where we procured a very nice, though rather stale, half-quarter home-baked loaf for a penny. The cow-boy sat by us on that roadside waiting for his can. The cows seemed to regard us with a sleepy look of mingled pity and indifference; while with the bottom crust of that loaf, and three pints of skimmed milk, I enjoyed the roadside breakfast of that summer morning more than I have enjoyed the banquet of this evening. On the first day, we walked forty miles, for which my pumps and what they covered suffered some. Our bed for the night was in one of those wayside hostleries called lodgings for travellers, for which accommodation we disbursed twopence. Late in the evening of the next day, we completed the remaining thirty-two miles, and found ourselves at the *Mother Redcap*, Camden Town, with enough in our pockets to procure half a pint of porter."

Bourbon Folly.

At the time of the Emperor Napoleon's exile to the island of Elba, among other small means to which the Bourbon king resorted in order to stay up his tottering throne, was the passage of a stringent law that no picture, statue, statuette, figure, or resemblance of "General Bonaparte," as he was called, should be suffered to remain in any place, public or private, among any residents, native or foreign. Consequently there was a sudden disappearance of every thing of the kind, from the bronze statue on the top of the pillar made from cannon taken at Austerlitz, which statue Louis Philippe had the good sense and discretion to restore, to the mere toy or thimble-case bearing Napoleon's profile upon its outline. Every house was to be visited and examined, to see that the order was strictly obeyed, and all offending articles were to be seized.

Mr. Wilder, an American residing in Paris, owning a particularly fine and correct bronze statuette of the emperor, buried it, with other things of the kind, in his cellar. His turn for inspection by the police came. In walked into his counting-room the officer, with his secretary and other attendants, who said in a pompous and semi-contemptuous tone, "Have you any statue, image, or likeness of any kind, of that man?" "Of what man?" said Mr. Wilder. "You know, sir, very well, who is meant," said the officer, impatiently; "that man—that usurper." "What man? what usurper?" said Mr. Wilder; "I am a stranger here." "Why do you keep me? You know whom I mean; that usurper—that Bonaparte, if you will have it," said the officer. "Have you any likeness or representation of him?" "Certainly I have," said Mr. Wilder; and, turning to a clerk, "Gougain, bring me a bag of Napoleons." Then, pouring them out on the desk before him, "Here they are, sir." The police official stared. At first he could make no answer; but then said, "That money is not what I want. You can keep that." "Go and tell your master," said Mr. Wilder, "that the whole specie currency of the realm must be called in before he

can keep from the eyes of the people the features of the Emperor Napoleon." "You are right," said the officer, now leaving, but continuing aside to his comrades, "it is ridiculous, truly, this business we are on; but the Bourbons cannot see it."

The Snake-Charmers.

Among the sights bordering on the marvellous which attract the traveller's attention in Egypt, beyond even the mysterious proceedings of the Cairene magician who professes to summon the dead to life, may be mentioned the interesting performances of the snake-charmers. These men belong to the order of Riface Dervishes. They profess to discover the presence of any venomous snakes which may be concealed in the house, a very common occurrence in the warm climate of Egypt, and, if there be such snakes, to allure them from their hiding-places.

The first measure usually resorted to by the wary spectator is to cause the performers to be thoroughly searched in the court-yard previously to their being introduced into the interior of the house, lest they may have snakes hidden either in the folds of their "cafans," or long flowing robes, or in those of their *libis*, or baggy trousers. Sometimes they are forced to deposit their voluminous garments in some corner of the court-yard, and, as an additional precaution, they are made to tuck up the loose sleeves of their *kamis*, or shirts, after these have been as closely examined as the rest of their clothes.

When all possible precautions have been taken, the snake-charmers are allowed to enter the house. Immediately on admission they assume an air of mystery, strike the walls and floor with a short palm-stick, whistle, make a chuckling noise with the tongue, and spit on the ground, exclaiming, "I adjure ye, if ye be above or below, that ye come forth;" "I adjure ye, by the most great name, if ye be obedient, come forth; and, if ye be disobedient, die! die!" However close may have been the previous search in every corner of the apartment, and in every piece of furniture and hanging drapery, in about ten minutes, generally speaking, after these exclamations, a snake is dislodged from one of the projecting cupboard doors with which most rooms are lined, or drops from the wood-work of the ceiling. The result of any incredulous expression on the part of the spectator, who may imagine the snake to be harmless, is to make the snake-charmer excessively indignant. He generally seizes one of the snakes by the neck, and, after displaying his fangs, tears him to pieces with his teeth, spitting out the bits on the ground with an excited, defiant air.

The only solution of this mystery is, that as these dervishes make it a practice to tame snakes, live habitually with them, and are not very cleanly in their habits, their bodies and clothes become deeply impregnated with the pungent oil which collects on the surface of the snake's skin, and thus the latter reptile, being gifted with strong olfactory nerves, is immediately made aware of an odor which appears to indicate the presence of members of his family, and comes forth from his hiding-place to greet them.

Dynamite.

Nitro-glycerine was discovered in the year 1847, by an Italian, named Ascegne Sobrero; but its practical application is entirely due to the researches of Alfred Nobel, a Swedish mining engineer. It does not explode when brought into contact with fire, and remains unchanged even when raised to the temperature of boiling water; but, at about forty degrees Fahrenheit,

it becomes converted into an icy mass, which merely requires friction to develop all its explosive qualities. This peculiarity had been the cause of many lamentable accidents, when M. Nobel commenced a series of experiments with the view of rendering its employment comparatively safe. After some time, he found that mixing it with about ten per cent. of wood-spirit rendered it practically harmless, and this method is now generally adopted. When required for use, the wood-spirit can be removed, and all the properties of the nitro-glycerine restored by the simple addition of water, which, mixing with the spirit, sets free, as it were, the nitro-glycerine. The only drawback to this plan is that, when the nitro-glycerine is reconverted into its original state, it is of course quite as dangerous as ever.

To obviate this, M. Nobel has invented a new mixture, which he terms "dynamite." It consists of seventy-five per cent. of nitro-glycerine, and twenty-five per cent. of very fine sand, and is a brownish-looking powder, something like saw-dust, only greasy to the touch. It burns without explosion when placed in a fire, or brought into contact with a lighted match. If struck with a hammer on an anvil, the portion struck takes fire without inflaming the dynamite around it. As a proof of the perfect security with which it may be handled, we may mention that M. Nobel has placed a case containing about eight pounds of it (equal to nearly eighty pounds of ordinary powder) on a brisk fire, and that the dynamite was consumed without noise or shock; while a similar case was flung from a height of sixty-five feet on to a hard rock without producing the slightest explosion. A weight of over two hundred pounds was then let fall from a height of twenty feet upon a box of dynamite; the box was smashed, but again there was no explosion.

The usual method of firing dynamite is by means of a copper capsule containing fulminate of silver—the latter being inflamed either by the ordinary slow-match, or by the electric spark. The employment of this capsule and detonating composition is absolutely essential for the explosion of dynamite. In order to give some idea of the force developed by such an explosion, it may be mentioned that a specimen of it placed upon a block of quartz, covered with bricks, and fired, caused the quartz to be broken up into pieces about the size of a pea, and reduced the bricks to powder. Like nitro-glycerine, dynamite congeals at a comparatively high temperature; but, to restore it to its proper condition, it is only necessary to put it in a warm place, or, if it is contained in closed cartridges, to plunge it into warm water.

In mining operations, dynamite possesses many advantages over nitro-glycerine, besides those already mentioned.

A Chinese Story.

Some years ago, when the Tai-ping rebels were devastating the most fruitful provinces of China, a novel plan was invented for discovering the money and other treasure concealed by the terrified merchants and people on the first warning of the approach of the rebels. Some ingenious Tai-ping thought within himself that, as men are all devout worshippers of gold and silver, something composed from man would, in all probability, be more efficacious than any thing else in discovering hidden treasures, without putting men to the pains of pulling down each separate brick of any suspected place, to get at the coveted hoard. He therefore seized the first prisoner he could lay hands on, and quietly proceeded to cut him up and put him into a large caldron, wherein he

was allowed to simmer until a sufficient containing of oil had collected on the surface; this was carefully skimmed off, and then a roll of cloth was spread out and soaked in the human oil, after which it was tightly rolled up and converted into a torch. The rebel then lit his torch, and, in a fever of expectation, started in quest of a likely house. Having found one to his taste, he entered, and slowly waved the torch in all directions, intently watching the flame, which shortly commenced flickering—like a man's fingers clutching at gold! The rebel was overjoyed at this sight, and felt sure that this was a sign that treasure was concealed exactly where the torch flickered; he accordingly set to work and pulled down that part of the wall, and sure enough there discovered a goodly hoard of silver. This plan was afterward universally adopted in the Tai-ping camp, and became so notorious that, on an imperial officer—in whose suite was my informant—taking one of the rebels prisoner, he questioned him as to the truth of the report, remarking, at the same time, that he could not possibly believe it. The prisoner declared that such was their method of discovering hidden treasure. Whereupon the officer replied that, as the prisoner persisted in vouching for the truth of the report, he would do himself the pleasure of testing its truth or falsehood on his person. The prisoner was immediately killed, cooked, and converted into a torch, and used with the greatest success!

The Long White Seam.

BY JEAN INGELow.

As I came round the harbor-buoy,
The lights began to gleam,
No wave the land-locked harbor stirred,
The crags were white as cream;
And I marked my love by candle-light
Sewing her long white seam.
It's aye sewing ashore, by dear,
Watch and steer at sea,
It's reef and furl, and haul the line,
Set sail and think of thee.

I climbed to reach her cottage-door;
Oh, sweetly my love sings!
Like a shaft of light her voice breaks forth,
My soul to meet it springs
As the shining water leaped of old,
When stirred by angel-wings.
Aye longing to list anew,
Awake and in my dream.
But never a song she sang like this,
Sewing her long white seam.

Fair fall the lights, the harbor lights,
That brought me in to thee,
And peace drop down on that low roof
For the sight that I did see,
And the voice, my dear, that rang so clear
All for the love of me!

For oh, for oh, with brow bent low
By the flickering candle's gleam,
Her wedding-gown it was she wrought,
Sewing the long white seam.

Robes de Chambre.

The Historical Museum in Munich has recently been presented with a new and certainly very curious article; it is the *robe de chambre* of the late King of Bavaria, Ludwig I., the same who made the famous Lola Montes a countess. The letter which accompanies this present states that the monarch wore this garment for sixty consecutive years. It is to be hoped that it has undergone a thorough scouring previous to being placed among the other curiosities of the Museum.

The idea of exhibiting *robes de chambre* in historical museums is not new; the *Musée des*

Souverains in Paris contains several of them, but they are not all as interesting as that of Ludwig I. This museum is considered by many a very useless institution. How many, among the present generation, care for most of the sovereigns? Yet the crown of Charlemagne, the panoply of Francis I. and that of Henry IV. are worth being preserved; so are the small hat, and the gray coat of Napoleon I. But among these interesting curiosities, the most worthy of attracting our attention is the precious little slipper made of black silk, worn out and patched, a mere rag, whose miserable appearance forms a strange contrast with the gaudy rags around.

This shoe is poor Marie Antoinette's. It slipped from her foot when her mutilated body was taken down from the scaffold. Picked up by a child, it passed into the hands of a royalist family, who kept it religiously for a long time, and afterward bequeathed it to the *Musée des Souverains*.

Its elegant shape, the delicate texture of the material, the perfection of the workmanship, show that it is the same which the unfortunate woman wore when she left the Tuileries for the prison of the temple. During all the time of her captivity she could not get any other, and was reduced, poor queen, to mend it herself. This waif tells more of the sufferings of Marie Antoinette than all the accounts of historians.

Canes.

In the manufacture of canes great quantities and varieties of materials are consumed. There is scarcely grass or shrub, reed or tree, that has not been employed at one time or another. The blackthorn and crab, cherry-tree and furze-bush, sapling oak and Spanish reed, are the favorites. Then come supple-jacks and pimentoes from the West Indies, rattans and palms from Java, white and black bamboos from Singapore, and stems of the bambusa—the gigantic growth of the tropics—from Borneo. All these must be cut at certain seasons, freed from various appendages, searched to discover defects, assorted into sizes, and thoroughly rid of moisture. A year's seasoning is required for some woods, two for others. Then comes the curious process of manufacture. Twenty different handlings hardly finish the cheapest cane. The bark is to be removed after boiling the stick in water, or to be polished after roasting it in ashes; excrescences are to be manipulated into points of beauty; handles straightened and shanks shaped; forms twisted and heads rasped; tops carved or mounted, surfaces charred and scraped, shanks smoothed or varnished, and bottoms shaped and ferruled. Woods, too, have to be studied, lest chemical applications that beautify one might ruin another kind. Some are improved under subjection to intense heat, others destroyed. Malacca canes have frequently to be colored in parts so that stained and natural surfaces are not distinguishable; heads and hoofs for handles are baked to retain their forms; tortoise-shell raspings are conglomerated by pressure into ornamental shapes, and lithographic transfers, done by hand, are extensively used upon walking-sticks for the Parisian market.

Some of Dickens's Characters.

Mrs. Bardell was a Mrs. Ann Ellis, who kept an eating-house near Doctors' Commons; a blustering Sergeant Bumpus was the original of Sergeant Buzfuz; and Mr. Justice Starecigh was a caricature, by no means extravagant, of Sir Stephen Gaselee. Mr. Fang, the truculent Bow-Street magistrate in "Oliver Twist," was a faithful portrait of Mr. Laing, a London police magistrate, whose conduct had long been a subject of bitter criticism in the newspapers.

"Oliver Twist" caused his removal. Traddles is said to have been Sir T. N. Talfourd; Esther Summerson a Miss Sophia Iselin, sister-in-law of Moxon, the publisher; and Detective Buckett, the well-known Inspector Field, with whom Dickens made several interesting tours of observation. In "Dombey and Son," several characters are said to have been drawn from life. Mr. Dombey is supposed to represent Mr. Thomas Chapman, ship-owner, whose offices were opposite the Wooden Midshipman. As if to make Mr. Chapman undoubtedly identical with Dombey, we have, as messenger of the commercial house of "Dombey and Son," one Perch, actually taken from a funny little old chap named Stephen Hale, who was part clerk, part messenger, in Mr. Chapman's office. Old Sol Gills was intended for a little fellow named Norie, who kept a very small shop in Leadenhall Street, exactly opposite the office of John Chapman & Co., in which "the stock in trade comprised chronometers, barometers, telescopes, compasses, charts, maps, sextants, quadrants, and specimens of every kind of instruments used in the working of a ship's course, or the keeping of a ship's reckoning, or the prosecuting of a ship's discoveries." In front of this small shop stands a figure carved in wood, and curiously painted, of a miniature midshipman, with a large quadrant in his hand, as if about taking an observation. What is more, the little shop and the Wooden Midshipman may be seen by the curious, adorning Leadenhall Street to this very day. Captain Cuttle was one David Mainland, master of a merchantman.

Wordsworth.

Wordsworth's favorite poet was Milton, as Southey's was Spenser, and I suppose that these poets to a certain degree served as models to them. It is curious to observe how Milton's genius triumphed over political prejudices in a mind so strongly imbued with them as that of Wordsworth. His veneration for Milton was so great that, if that poet used a particular word in a particular sense, he would quote his authority to justify himself when his wife or daughter objected to its employment in his own poems. The fact of Milton preferring Euripides to the other Greek tragedians, served to raise that dramatist in his opinion. Perhaps he was almost as much attached to Milton as he was to his own lakes and mountains, in which he could never see a fault. With respect to the latter, I doubt whether he thought they were equalled by any scenery in the world, and whether he would not have given them the preference even to Switzerland. In comparing them to Killarney, he admitted that there was one view there—I think it was the view between the upper and lower lake—which was superior to any in Cumberland or Westmoreland; but, as a whole, he thought Killarney inferior to the English lakes.

Wordsworth was never, as far as I know, addicted to field sports or other manly exercises; I doubt whether he was ever on a horse in his life. For I recollect that Hartley Coleridge, in criticising one of his poems—"Lucy" I think—said that a certain verse, in which the poet described himself as riding, was spoiled for him (H. C.), because the idea of Mr. Wordsworth on horseback was utterly incongruous. The only feat I remember his performing in the way of sport, was endeavoring to catch what he thought to be a trout, by tickling it, but which, when he hauled it on shore, to his horror proved to be a toad!

Habits of Robert Burns.

The family breakfasted at nine. If he lay long in bed awake, he was always reading. At

all meals, he had a book beside him on the table. He did his work in the forenoon, and was seldom engaged professionally in the evening. Dined at two o'clock, when he dined at home. Was fond of plain things, and hated tarts, pies, and puddings. When at home in the evening, he employed his time in writing and reading, with the children playing about him. Their prattle never disturbed him in the least. Had but rarely company in the evening. Was much occupied composing his songs, most of which he wrote several times over. "Had plenty of excise-paper, and scrawled away." Mrs. Burns thinks he chiefly composed while riding and walking, and wrote from memory after he came in. Was not a good singer, but had a very correct ear. Could "step a tune" rudely on the fiddle, but was no player. Sometimes took this method of satisfying himself as to the modulations of a tune. Was very particular with his letters, when of any consequence; and uniformly wrote a scrawl before the principal. Went to bed generally at eleven o'clock, and sometimes a little sooner. Went to church frequently in the afternoon; went often to Mr. Inglis's, the Dissenting clergyman. Never took supper, and never drank by himself at home. The drink then was chiefly rum and gin; very little whiskey was used. Burns never spoke English, but very correct Scotch.

Lovers' Stratagems.

Talking of lovers' intercommunications, modern courtship finds expedients that surpass Ovid's powers of invention. Two such come to mind. One was described to me by a party to it, a droll French *barbier* full of anecdote, who used to operate upon my *chevelure*, and nearly made me bald with his stories; for while I listened he talked, and while he talked he cut. He had kept a shop in a native country town, and thither used frequently to go a young demoiselle closely watched by her duenna. Her hair was curled in papers, which were letters to her lover. The hair-dresser took these out and laid them aside, replacing them when necessary with others, which were letters from the forbidden youth. This curl-paper love-making went on for months; the end of it does not concern us. The second expedient was witnessed in Seville. At dark, a young don stole beneath a lofty window, unscrewed the handle of his walking-stick, drew out length after length of its tubular interior, and fitted the parts like a fishing-rod; he put a mouth-piece at each end, and raised one end to the envied lattice. A head appeared; and as long as the spectator's patience lasted he saw lips and ears above and below alternately applied to the soul-communicating pipe. Johnson's fishing-rod—"a worm at one end and a fool at the other!" Which was which?

House-Servants.

A writer in *London Society* says: I remember a lady being at the Botanical Gardens one day, and, while looking at the swans in the ornamental water, she accidentally touched the foot of another lady similarly employed. She immediately apologized, and the stranger, turning to bow, revealed her own house-maid. The girl was really elegantly dressed—better dressed and better looking than her mistress. The latter commenced a severe and angry lecture; but the house-maid took it very calmly, and told her mistress that she might provide herself with another house-maid by the end of the month. I believe there are certain houses in town to which servant-girls resort to doff their ordinary attire and don their ladylike raiment. I know a Frenchwoman who told her mistress that she meant to stay at home for a time to "compose herself and get her hands white."

Those who can read take a lively interest in the correspondence of the family. I know a family who were extremely annoyed by some piece of unpleasant family news becoming circulated in the neighborhood. They were careful people, and took pains either to lock up or destroy their letters. But it seemed that they tore up their letters into "spills," which they put into a vase on the drawing-room mantelshelf, and a servant had actually sewed together these "spills," and read off the contents of their letters.

Why they went to War.

A certain king, it is said, sent to another king, saying, "Send me a blue pig with a black tail, or else—" The other, in high dudgeon at the presumed insult, replied, "I have not got one; and if I had—" On this weighty cause they went to war for many years. After a satiety of glories and miseries, they finally bethought them that, as their armies and resources were exhausted, and their kingdoms mutually laid waste, it might be well to consult about the preliminaries of peace; but, before this could be concluded, a diplomatic explanation was first needed of the insulting language which formed the ground of the quarrel. "What could you mean," asked the second king of the first, "by saying, 'Send me a blue pig with a black tail, or else—?'" "Why," said the other, "I meant a blue pig with a black tail, or else some other color. But," retorted he, "what could you mean by saying, 'I have not got one, and if I had—?'" "Why, of course, if I had, I should have sent it." An explanation which was entirely satisfactory, and peace was concluded accordingly.

Aristotle.

Aristotle had nothing of the austerity of the philosopher, though his works are so austere. He was open, pleasant, and even charming in his conversation, fiery and volatile in his pleasures, magnificent in his dress. He is described as fierce, disdainful, and sarcastic. He joined to a taste for profound erudition that of elegant dissipation. His passion for luxury occasioned him such expenses when he was young, that he consumed all his property. Laertius has preserved the will of Aristotle, which is curious. The chief part turns on the future welfare and marriage of his daughter. "If, after my death, she chooses to marry, the executors will be careful she marries no person of an inferior rank. If she resides at Chalcis, she shall occupy the apartments contiguous to the garden; if she chooses Stagyræ, she shall reside in the house of my father, and my executors shall furnish either of those places."

Varieties.

PRINCESS LOUISE is to have eight bridesmaids, seven of whom have been selected: Lady Constance Seymour, daughter of the Marquis of Hertford; Lady Elizabeth Campbell, daughter of the Duke of Argyll; Lady Florence Lennox, daughter of the Duke of Richmond; Lady Florence Loveson-Gower, daughter of the Duke of Sutherland; Lady Mary Butler, daughter of the Marquis of Ormonde; Lady Alice Fitzgerald, daughter of the Marquis of Kildare; and Lady Florence Montagu, daughter of the Earl of Sandwich.

Recollecting the unhappy fate of the library at Strasbourg, which was completely burned during the siege, it is some consolation to lovers of books that Metz escaped a bombardment so that her library and museum remain still intact. The library consists of about thirty thousand volumes of printed books and eleven hundred and fifty-seven manuscripts, many of which date as far back as the tenth, eleventh, twelfth, and thirteenth centuries. Some are beautifully illuminated, and others are his-

pecially valuable, such as the chronicles of Paul Ferry and Philippe de Vigneulles.

Persons who prefer oysters cooked in their own liquor may be interested in knowing what the fluid contains. The *Journal of Microscopy* says: "Open an oyster, retain the liquor in the lower or deep shell, and, if viewed through a microscope, it will be found to contain multitudes of small oysters, covered with shells and swimming nimbly about—one hundred and twenty of which extend but one inch. Besides these young oysters, the liquor contains a variety of animalcula and myriads of three distinct species of worms. Sometimes their light represents a bluish star about the centre of the shell, which will be beautifully luminous in a dark room."

The *Cincinnati Enquirer* makes the following correction of an error which occurred in its publication of the President's message: "A topographical error of importance occurred in that portion of the message, published yesterday, which said that the course pursued by the Canadian authorities toward the Irishmen of the United States has not been marked by friendly feeling." The word Irishmen should be fishermen."

An enterprising agriculturist in Nebraska has planted one hundred acres with walnuts, and anticipates a very remunerative harvest in twenty years. Each acre will have six hundred and fifty trees, he says, which will be worth two hundred thousand dollars. He proposes next to try the pine, which will be marketable in fifty years. This sounds a little like the man who caged an eagle to ascertain whether it lived one hundred years.

Here are two small jokes about the river, which gives its name to the port of Liverpool: A wag, crossing to Woodside Ferry, and observing the muddiness of the water, remarked that Shakespeare was quite correct in stating that "the quality of *Mercy* is not strained." A Liverpool pilot, adrift in the Irish Sea during a dense fog, is said to have fervently uttered two lines from a well-known hymn:

"That Mersey I to others showed,
That Mersey show to me."

An ingenious confidence-scamper called on the wife of a Boston physician the other day, citing the absence of her husband, and, representing that he owed the doctor twenty-five dollars, tendered a bogus check for thirty dollars, and received five dollars in change. The same trick was tried a few days afterward elsewhere, but the publicity given the first transaction frustrated the game.

The Manchester papers describe a new instrument of torture which has been set up at several works, and is intended to arouse the workmen from their slumbers. This "American devil," as the English workmen call it, is set to work at half-past five every morning, and it wakes every one within two miles. The "American devil" is known to its friends as a "steam-gong."

The Prussians let loose hawks, whenever suspicious-looking birds are seen on the wing about Paris. The attacks which these birds of prey make upon the weaker birds is doubtless an explanation of the report that but a small number of pigeons carried away from Paris ever return. The hawks are called uhans of the air.

Vicount Vilain XIV. has been reflected on by the Chamber of Representatives in Belgium. As the title of Vilain XIV. goes from father to son without ever becoming XV., it should be stated, to explain the apparent anomaly, that the addition of XIV. was conferred by Louis XIV. as a permanent distinction in allusion to his own title.

The two official documents which issue from the pope are distinguished as the bull and the brief. To the bull is attached the papal seal, or *bullo*, from which it derives its name, while a brief is sealed with the "Ring of the Fisherman," or a seal on which is engraved the image of St. Peter in a boat.

"We regret," says the London *Army and Navy Gazette*, "that, in the face of the alarm of the Eastern difficulty, recruiting has practically come to so near a stand-still that

the standard of height was officially lowered this week by a private order to five feet four and one-half inches."

There is sometimes wit in an unwitting answer, as in the reply of the lady who, when asked "What's the difference between the North and South Pole?" unconsciously replied, "Why, all the difference in the world."

The milling of coin, which Queen Elizabeth established to prevent clipping, has retained its efficacy until the present inventive era, and now two men have been caught in San Francisco shaving fifty and sixty cents off of twenty-dollar gold-pieces, and then remilling them.

Hans Christian Andersen is described as tall, rather round-shouldered, with iron-gray hair. He is not handsome; but, when he smiles, it makes one love him, it is so genial and pleasant. He is perfectly simple and childlike in his manner, and is a bachelor of sixty-five.

A colored mail-carrier in Virginia was recently well shaken by a man for kicking his dog. "Look-a-here, massa," said he, "you'd better be careful how you shake dis chile! 'Cos when you shakes me, you shakes the whole of the United States; I carries de mails."

A new ticket-printing machine, which has just been patented in England and Prussia, prints railway-tickets on both sides, perforates them, and numbers them consecutively, by one process, and does all this at the rate of two hundred a minute.

A letter from Paris says: "It is strange and painful to see groups of well-dressed women looking in the windows of pork-butchers and tripe-shops with the same eager curiosity with which they used to gaze at ribbons and bonnets."

A Peoria lady of fashion has ordered a gorgeous coffin and funeral trappings, and proposes to have all her friends and acquaintances, without partiality, invited to attend her obsequies, by notices printed on the choicest paper. She has not fixed the date.

It is five years since nitro-glycerine came into use. The one thousand seven hundred persons whom it has killed or maimed for life, and the millions of property which it has destroyed, may be styled recommendations of its efficiency.

Emily Pitts Stevens proclaims to a suffering world that, when women vote, "poverty, idleness, drunkenness, broken-down constitutions in young men and young women, and infant-slaughter, will not be perpetuated or tolerated even."

It is a pleasant thing to reflect upon, says Dickens, and furnishes a complete answer to those who contend for the gradual degeneration of the human species, that every baby born into the world is a finer one than the last.

The American Tract Society has issued four thousand different publications, in one hundred and forty-three different languages. Every day their presses throw off five thousand books and fifty thousand tracts.

The Superior Court in Cincinnati decides that a wife has a vested right in her husband's society and companionship, and can maintain an action for damages against any person who tempts him to stay away from home.

There are two reasons why some people don't mind their own business. One is that they haven't any business, and the second that they have no mind.

Mr. Gladstone spoke one hundred and seventy-eight times during the late session of Parliament, and the speeches occupy eighty columns of the *Times*.

A little girl wants to know if fleas are white, because her uncle told her that "Mary had a little lamb with fleas as white as snow."

If a man does not make new acquaintances as he advances in life, he will soon find himself alone. A man should keep his friendship in constant repair.

Eight of the foreign diplomats at Washington are married to American wives.

The Chinese at North Adams, Massachusetts, have a Sunday-school. They are very eager to learn, and the classes are always full.

The French balloons, with a fair wind, go about as fast as the express-trains on American railroads.

The widow and two daughters of Nathaniel Hawthorne are now living in Kensington, the "old court suburb" of London.

There are now more than a score of republics in the world.

Five women run and own boats on the Erie Canal.

A Chicago girl, who has lost a leg, advertises for a husband similarly afflicted.

Out West raw potatoes are administered as a cure for intoxication.

London has thirty-two slang synonyms for drunkenness, and seventeen for money.

California boasts of acorns as large as horse-chestnuts.

The ship that everybody likes—Good fellow-ship.

One poultry fancier in California has ten thousand hens.

There are four hundred and thirty-seven lakes in Oakland County, Michigan.

Sincerity is the leading characteristic of a really heroic life.

Western adaptation of the words of the poet: "Loathe the poor Indian."

The Museum.

IN continuation of our geological series, we present this week an ideal landscape of the Miocene Period, the second subdivision of the Tertiary Epoch. Our illustration exhibits some of the remarkable mammals of this era. In the foreground, to the right, is the dinothierium, lying in the marshy grass, to the left is the rhinoceros, and behind it the mastodon. An ape of great size, the dryopithecus, is seen hanging from the branches of a tree. The vegetable kingdom is for the greater part analogous to those of our days. Oaks grow side by side with palms, the birch with bamboos, elms with laurels.

The dinothierium is the largest terrestrial mammal that ever lived. This colossus of the ancient world somewhat approaches the mastodon; it seems to announce the approach of the elephant, but its dimensions were vastly greater than those of living elephants, and superior even to those of the mastodon and of the mammoth, both fossil elephants. From its kind of life the dinothierium scarcely merits its formidable name (from *δεινός*, terrible; *θηρίον*, animal). Its size was, no doubt, frightful enough, but its habits seem to have been harmless. It is supposed to have inhabited freshwater lakes, or the mouths of great rivers and the marshes bordering their banks, by preference. Herbivorous, like the elephant, it employed its proboscis probably in seizing the plants which hung suspended over the waters, or floated on their surface. We know that elephants are very partial to the roots of herbaceous plants which grow in flooded plains. The dinothierium appears to have been organized to satisfy the same tastes. With the powerful natural mattock which Nature had supplied him for penetrating the soil, he would be able to tear from the bed of the river or lake feculent roots like those of the nymphaea, or even much harder ones, for which the mode of articulation of the jaws, and the powerful muscles intended to move them, as well as the large surface of the teeth, so well calculated for

grinding, were evidently intended. For a long time the imperfect remains discovered of this animal induced Cuvier to place it among the tapirs, but the discovery of a lower jaw, nearly perfect, armed with long defensive tusks descending from it, demonstrated that this animal was the type of an altogether new and singular genus. In 1836 a head, entire, of this

creature was found in the Grand-duchy of Hesse-Darmstadt. It was a yard and a half long and above a yard wide.

The mastodon was, to all appearance, very nearly of the form of our elephant—his body, however, being somewhat longer, and his limbs, on the contrary, a little thicker. He had tusks, and very probably a trunk, and is

chiefly distinguished from the existing elephant by the form of his molar teeth. The name means teat-like toothed animal. In 1796 remains of this animal were found at Albany, but it was not till 1801 that a nearly perfect skeleton was discovered near Newburg, on the Hudson. Only fragments of the mastodon have been found in Europe.

WITH SUPPLEMENT.

THE MARTYRS OF MADAGASCAR.*

THE magnificent island of Madagascar, one of the largest in the world, lies in the Indian Ocean, off the eastern coast of Southern Africa, from which it is separated by the Mozambique Channel, three hundred miles broad. The island is nearly a thousand miles in length from north to south, with an average breadth of two hundred and forty miles, and its area is, therefore, twice as large as that of

acknowledgment and homage, if not tribute, as the rulers over the entire country. The capital of the kingdom is Tananarivo, a large town nearly in the centre of the island.

The earliest embassy of friendship to the central regions of Madagascar was sent by the English in 1816 to the first Radama, ruler of the Hovas, and then in the twenty-fourth year of his age. This young

VIEW IN TANANARIVO.

the British islands, or nearly five times that of the State of New York. The population is estimated at four million, comprising several races, some of whom are negroes, while others are of Malayo-Polynesian origin. Among these last are the Hovas, who occupy the elevated and central part of the island. This race, though themselves formerly tributary to the more numerous Sakalavas in the southwest, have, since their alliance with the English, subjugated the other races, established their military posts in every province, and now receive

prince, the most enlightened ruler ever known in Madagascar, joyfully welcomed the envoy, and treated him with assiduous kindness.

Compared with Europeans, the Madagascans were uncivilized, though in some respects they were greatly in advance of the tribes inhabiting the adjacent coast of Africa, the natives of Australia, or the South-Sea Islanders; and they had already attained some of the important elements of a higher civilization. Most of the races had an organized civil government. They were a nation of agriculturists and herdsmen. The flesh of the ox constituted their chief animal food, and though some of the tribes cultivated arrow-root, or a species of pulse, and though fruits were abundant, rice was with most of them

* THE MARTYR-CHURCH: A Narrative of the Introduction, Progress, and Triumph of Christianity in Madagascar. By Rev. William Ellis, London, 1870.

the staff of life, and constituted their daily food. Oxen and rice were also, after the abolition of trade in slaves, their most important articles of export.

The climate of Madagascar is warm, yet all the inhabitants, above the very poor, are decently, and some of them now richly clothed. Large herds of cattle feed on their plains, or are fattened in their pens or stalls, though the people never clothe themselves with their skins. Caterpillars or worms of different kinds feed on the leaves of indigenous or exotic plants, and spin delicately fine or coarse silk, which is cleaned, and colored with native dyes. This silk is spun in simple looms, of Indian or Arabian origin, woven not unfrequently with beautiful and curious patterns into rich and gorgeous dresses for the nobles of both sexes, and for the higher classes in Madagascar generally. Cotton is grown throughout the country, and a species of nettle yields a tenacious fibre resembling hemp, which is also manufactured into strong and durable woven cloth, worn by the farmers and middle classes, wrapped round the body by day, and spread over them at night.

The morals of the people, before the introduction of Christianity,

more lives and inflicted greater suffering than any other single cause in Madagascar.

But the most direct power over the people was the *sikidy*, or divination, which, in different forms, prevailed throughout the island. Believed to have been received from a supernatural source, and regarded as the will of God, the influence of the *sikidy* extended over both worlds, affecting gods and men, as well as the unquiet ghosts which left their graves to disturb the living. The most baneful influence of the diviners was their pretending, by calculations based on the age and position of the moon at the period of birth, to reveal the destiny or *vinana* of every newly-born infant, thus deciding, whatever its rank or parentage might be, whether its life should be preserved or destroyed. The decisions were believed to be those of God, and, though determined by a table of divination which might be worked almost like a game of chess, were received by the people as their fate.

This brief notice of the social and moral condition of the people; and of the superstitions and idolatries of the country, will enable us to form a more correct opinion than would otherwise be possible of the

AMBODINANDOHALO.

were very bad. Truth and honesty were rare, and chastity was little regarded by either sex. Idolatry prevailed, though there seems to have been some idea of the existence of a supreme and spiritual deity. Every family possessed its household god; and the sun and other heavenly bodies, certain valleys and mountains, in which idols were kept, or in which renowned men had lived, were deemed sacred and worshipped. The spirits of their ancestors, and those of the ancestors of the reigning sovereign, were objects of the highest religious regard.

The national idols were of comparatively modern origin, being an extension of the principle of household worship, introduced from political motives by successive rulers representing themselves as the fathers of the people. There were fifteen of these in Ankova, the land of the Hovas, two of which were supposed to preside over the entire kingdom.

The belief in fetishism, sorcery, or divination, was a fertile source of misery and crime, and often enjoined the iniquitous and deadly poison ordeal, which was deified and invoked as the trier of innocence or guilt under the name of Rai-ma-na-man-ga, and probably destroyed

encouragements, as well as of the appalling antagonism, by which Christianity was confronted on its entrance into Madagascar. It will also show the combined and organized forces which so fiercely disputed every step in its advance, and enable us more clearly to comprehend the marvellous victory which God, by the Gospel, has achieved among the people, and which ranks among the most remarkable triumphs of Christianity in the nineteenth century.

The conversion of Madagascar began in 1820, under the auspices of the London Missionary Society. Mr. Jones, the first missionary, with the approbation of King Radama, began his great work of teaching with three scholars, who had multiplied to thousands when Radama died, in 1828. His successor, Queen Ranavalona, was a zealous pagan, and soon began to persecute the Christians, partly, however, for political as well as religious reasons. The missionaries were forbidden to teach or to preach, but were for some time allowed to continue the work of translating and publishing the Scriptures in the native language.

In a year or two, however, through English influence, greater liberty was allowed, and in 1830 several hundred youths were under

NATIVE PASTORS AND DEACONS OF THE FIRST CHURCH.

instruction, and five thousand copies of the New Testament were printed and circulated. In 1831 the queen gave permission to her people to be baptized, to commemorate the death of Christ, and to be married in the Christian manner. On the 29th of May of that year, twenty of the first converts were baptized, and in the following August a church was organized at Ambodinandohalo, the place of which we give a view. The church was formed in a building behind the large trees, on the left of our view. Shortly afterward another church was organized at Ambatonakanga, of whose native pastor and deacons we give the portraits.

The favor of the suspicious queen soon passed away, and various edicts were issued against the Christians, whose numbers were increasing rapidly. At the end of fourteen years, from the commencement of

NATIVE CHRISTIANS OF VARIOUS RANKS.

the mission, it was estimated that there were at least thirty thousand native readers of the Scriptures. By the heathen party the doctrines of Christianity and the designs of the Christians were grossly misrepresented. The queen was made to believe, or pretended to believe, that the Christians were traitors not only to the national gods, but to the sovereign herself. Jehovah and Jesus were said to be English kings, by whom Madagascar would be invaded, and to whom the Christians had sworn allegiance, regardless of the rights of their native ruler. One of the principal chiefs, after attending a Christian meeting, went to the queen and reported that the converts were changing the customs of their ancestors, despising divination and the idols of the queen. "They hold," he added, "assemblies in the night, and deliver speeches, without per-

mission from the queen. Beyond this, they urge all present to serve Jehovah and Jesus Christ; and these meetings are carried on by slaves. We cannot see the end of these things. The queen knows, and she alone, what is best to be done; but we fear these people, who have become so friendly with the English, will attempt to transfer the kingdom of the queen to them."

Ratsimanisa, the chief minister, laid this accusation, with his own confirmation of its charges, before the queen on the following day, when, it is said, she burst into tears of grief and rage, and wept for a long time. She then swore, by the name of the highest spiritual power to whom she could appeal, that she would put a stop to these things with shedding of blood.

On the 1st of March, 1835, a national assembly, called by the queen, was held at Tananarivo, at which it was estimated that at least a hundred thousand persons, fifteen thousand of them disciplined soldiers, were present. The object of this gathering was to strike terror into the Christians, and to promulgate, in the most solemn manner, a royal edict prohibiting baptism, church meetings, the observance of the Sabbath, and other tokens of Christian belief. For a while no blood was shed. Four hundred officers of the army, convicted of adher-

yielding to the advice of their native friends, withdrew from the country.

Among the native converts was Rafaravavy, a woman of rank and position, the wife of a colonel in the army.

Before the suppression of Christianity she had obtained one of the largest houses in the capital, which she appropriated to Christian worship; and her simplicity of character and earnestness induced many to attend the preaching of the Gospel.

Notwithstanding the punishment threatened by the queen, Rafaravavy and a few female friends occasionally met in her house on Sunday evenings to read and pray. On the 17th of June, 1835, three of her slaves went to the judge and accused her of these practices. A Christian who heard the accusation hastened to inform her of it. She immediately placed her Bible and other books in a place of security, while her father, on hearing what the slaves had done, had them

confined in irons. Rafaravavy, however, ordered them to be liberated, sent for them, forgave them, wept over them, and spoke to them of the mercy and forgiveness of God through Christ. Two of them afterward became Christians, and one of them died for her faith.

The judge demanded the names of her companions, and, on her

HOME OF ANDRIAMANANTENA, ONE OF THE CHIEF MARTYRS.

CHRISTIAN VILLAGE OF LAZAINA.

ing to the new faith, were reduced in rank, and two thousand other persons were fined. The majority of the converts stood firm, and accessions to their numbers were constantly made. The government, however, gradually grew more severe, and, in a few months, the missionaries,

refusal to give them, reported her offence to the queen, who, in great wrath, exclaimed, "Is it possible that any one is so daring as to defy me? And that one a woman, too! Go and put her to death at once!" Two of the queen's high officers, and a woman of rank and influence

with the queen, pleaded for the life of the accused, on account of services which her father and brother had rendered to the state, and the sentence was deferred.

Two years later, in 1837, Rafaravavy was again denounced, with ten other Christians, for meeting on Sunday for prayer and worship. The chief officer of the queen, to whom the judges carried the accusation, declared, with an oath, "Then they shall die! for they despise the queen's law." They were all immediately arrested except Rafaravavy, whose family influence for a time protected her. She was interrogated by the officers, however, to discover her associates, but she refused to disclose their names. They then brought one of her companions who had confessed that she prayed with her, and, when confronted with her, Rafaravavy said, "We have prayed together; we do not deny it;" and, when further asked, "Where have you prayed?" she replied, "In our own houses, and in many other places. Wherever we went we endeavored to remember God, and pray to Him." On being asked if they had not met for prayer at Akatso, a mountain, they answered, "Yes, but not there only. Wherever we went we remembered God, in the house and out of doors, in the town and in the country, or on the mountains."

The officers then proceeded to the other Christians already in prison, chiefly for the purpose of inducing them to name those not yet accused. They falsely told a young woman whose name was Rasalama, that the others had already given the names of all the Christians, so that it would be of no avail for her to refuse to mention those she knew. Influenced by this specious

READING THE SCRIPTURES TO A CHRISTIAN CAPTIVE.

THE PLACE OF MARTYRDOM.

declaration, Rasalama mentioned the names of seven who had not before been impeached, and these, among others esteemed and beloved, included Raintscheva, the diviner, known among the Christians as Paul. The seven were immediately apprehended, and the declarations—confessions, as they were called—of the whole were then laid before the queen.

Fourteen days later Rafaravavy was arrested, put in fetters, and carried to Ambobipotsy, the place where criminals were usually put to death. Rasalama, the Christian woman who had been deluded into revealing the names of seven other Christians, was now ordered for execution the next morning, and on the previous afternoon was put in irons, which, being fastened to the feet, hands, knees, and neck, confined the whole body in a position of excruciating pain. In the early morning she sang hymns as she was borne along to the place of execution, expressing her joy in the knowledge of the Gospel; and, on passing the chapel in which she had been baptized, she exclaimed, "There I heard the words of the Saviour!" After being borne more than a mile farther, she reached the fatal spot, a broad, dry, shallow fosse, or ditch, strewed with the bones of previous criminals, outside of what was formerly a fortification, at the southern extremity of the mountain on which the city stands. Two or three hundred feet below this Golgotha stretches the wide plain, spotted with villages, verdant with rice-fields, and irrigated by streams from the Ikiopa, which, issuing from the lofty Ankaratra, almost encircles the capital in its course to the sea on the west.

Here, permission being granted her to pray, Rasalama calmly knelt

on the earth, committed her spirit into the hands of her Redeemer, and fell with the executioners' spears buried in her body. Some few of the by-standers, it was reported, cried out, "Where is the God she prayed to, that He does not save her now?" Others were moved to pity for one whom they deemed an innocent sufferer; and the heathen executioners repeatedly declared, "There is some charm in the religion of the white people which takes away the fear of death." So suffered, on the 14th of August, 1837, Rasalama, the first martyr of Madagascar.

After the death of Rasalama, the other Christians under arrest, to the number of two hundred, were sold as slaves. The aged Paul, who had been heavily ironed night and day, and guarded as a felon, became a slave of the chief minister, who sent him to field-work with four other Christian slaves. They were in the rice-fields all day and in irons all night, but had a hut to themselves; and the venerable servant of Christ proved a great source of consolation to his fellow-slaves, often repeating to them the forty-sixth Psalm, which he had committed to memory.

Rafaravavy, who had now been some months in irons, constantly guarded by soldiers, was, by an order of the queen, sold in the public market to the chief military officer; and he placed her in the charge of one of his aides-de-camp, who was a relative, and who treated her kindly, giving her liberty to go and come, so that her Christian work was not neglected.

Rafaralahy, a young man about two-and-twenty years of age, who had accompanied Rafaravavy herself, when it was supposed she was being carried forth to execution, who had witnessed the tranquil death of Rasalama, and had been accustomed to receive a number of the Christians at his house, which was nearly two miles from the capital, for reading and prayer, was next arrested. After being confined in heavy irons for three days, he was taken out for execution. On the way he spoke to the officers of the love and mercy of Christ, and of his own happiness in the prospect of so soon seeing his Redeemer. Having reached the place of execution, the same spot on which Rasalama, nearly twelve months before, had suffered, he spent the last moments of his life in supplication for his country and his persecuted brethren. As he rose from his knees the executioners were preparing to throw him on the ground, but he told them that was needless; he was ready to die; and, laying himself down, was instantly speared to death.

Orders were now issued for the death of Rafaravavy, but she was warned in time, and made her escape from the capital, and, after wandering for several months in the forests of the interior, everywhere closely pursued, reached at last the sea-coast, and took refuge on an English ship, which carried her to Mauritius. Thence she proceeded to England, where she was warmly welcomed by the friends of missions.

The third martyr was a young woman named Ravahiny, who was compelled to drink the fatal ordeal-poison called *tangena*. The next execution was on the 9th of July, 1840, when nine martyrs fell beneath the spears of the executioners, among them Paul the diviner, and Joshua the preacher. Two more were put to death June 19, 1842. After this, for several years, there were few executions, though many Christians were sold as slaves, and otherwise maltreated. But, in 1849, a heavy storm of persecution burst upon the Madagascar Church. Sixteen persons, among them four nobles of the highest rank, were put to death, some of them by burning, while one hundred

and seventeen were publicly flogged and condemned to hard labor in chains for life. Many others were imprisoned and heavily fined. The total number of those on whom one or other of the sentences was pronounced on this occasion amounted, at the least computation, to nineteen hundred and three, but by some accounts it is nearer three thousand. The martyrs who were burned died bravely in the sight of a vast multitude, singing Christian hymns and praying for their persecutors, who in vain sought to silence them by the roar of cannon and the incessant beating of the drums of the army.

It is a remarkable fact that, while the queen was the bitterest enemy of the Christians, her son and heir, Radama II., was, from the age of sixteen, attached to their doctrines and a frequent attendant on their meetings, and his influence seems to have been one of the chief agencies in lulling the storm of persecution, which gradually subsided, until, in 1853, the Christians ceased to be molested, though the profession of their religion continued to be illegal. In 1857, however, a French conspiracy for the dethronement of the queen being detected, a fresh persecution of the Christians ensued, in which more than two hundred were severely

CHURCH OF THE MARTYRS.

punished, and about fifty put to death. This was happily the last persecution. The pagan queen died July 16, 1861, and Radama II. succeeded to the throne. Though the new king could hardly be called a Christian, he was friendly to those who held the Christian faith. One of his earliest edicts proclaimed liberty to all religions, another recalled the Christian exiles and released the Christian captives, while still another abolished sorcery and the ordeal by poison. The English missionaries returned to the island, and from this time the progress of the Church in Madagascar was rapid, and finally triumphant. The king was murdered by conspirators, on May 12, 1864, and his widow, Rasoherina, was made sovereign. At the first audience she gave to the missionaries, the queen stated that the liberties and privileges of the Christians would be preserved in their full extent, and they were at the same time assured that the objects of the mission were approved. The queen herself was not a Christian, but was publicly regarded as the head of the heathen and the patron of the idols; yet she faithfully preserved inviolate the liberty of worship and teaching to the missionaries and their converts.

In the beginning of 1867 a large church, of which we give a view, was erected in memory of the martyrs on the spot where they had suffered. Thousands of Christians assembled to witness its dedication, and the queen sent in state seven of the highest officers of the government, who were Christians, to testify her approval of the building.

By the close of the year the number of native Christians was computed at twenty-one thousand, of whom five thousand were communicants.

Queen Rasoherina died April 1, 1868, and was succeeded by her sister, who took the name of Ranavalona II., and who is still on the throne. She is remarkable for her gentle and amiable character, and, since her accession, has publicly professed Christianity. The latest intelligence that we have seen from Madagascar states that, a few months ago, the queen ordered the idols to be burned, and teachers of Christianity to be sent to every village in the island, the whole population of which is rapidly becoming converted to the faith in Christ.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER III.

AFTER she had opened her casement to the fresh air of dawn, Daisy fell asleep. She slept late, and woke to a morning of exquisite brightness.

Night had not brought wisdom, nor darkness counsel, but morning brought hope—of what?

Of a pause in her troubles, of a few quiet days.

Daisy was selfish and cowardly; but there was excuse to be made for her. She had suffered so much, while she was still unripe for suffering well and wisely, that she had suffered with mere animal endurance, getting, therefore, the bane and not the blessing of suffering. While the dawn, the bloom, the dew, had been still upon all her girlish imaginings, she had been suddenly subjected to the rudest disillusion, buffeted by the most outrageous shocks of knowledge, not of good and evil, but of evil only. It was, indeed, as if an unawakened maiden soul had been seized and plunged into hell for its awakening.

It seemed to Daisy that it had been with her as with the fated ship, which, in a rude engraving that had exercised a horrible fascination over her as a child, was being sucked into the vortex of a whirlpool.

Nevertheless, so much of elasticity remained, that the brisk brightness of the spring to-day almost enabled her to forget the misery of yesterday and the hopelessness of to-morrow.

A wood-fire was burning cheerily on the hearth when she came down to the breakfast-room. The table was set near the open window, and the sunshine fell upon its snowy cloth, bright silver, and delicate china. Out-doors a fresh, but soft, southwest wind was chasing April shadow and April shine across lawn and flower-border, rippling the bed of many-colored anemones, and filling the golden cups of late crocuses.

In the orchard, which was full in sight, were some grand old pear-trees, now one mass of blossom; the boles of the elm-trees, which, on another side, sheltered the garden, were just a-flutter with fresh-degged leaflets. It was a world of life and motion, of shimmer, and shine, and glitter, and gleam, and the time of the singing of birds was, indeed, come.

Daisy stood at the window.

"How beautiful the world is! Surely, somewhere in it is some place meant for me to be happy in," was her childish thought. And then she stood there in a dream, till the servant, coming in with the coffee, roused her, and she turned to the table.

Three or four letters lay beside her plate; but Daisy never had letters of any interest, and they roused no curiosity. As she sat there with fresh morning face, in her fresh morning dress, a glass of flowers beside her, every now and then stretching her head into the sunshine, feeling it sweet, the belief was strong upon her that some sweetness, some sunshine must, somehow, be meant to fall upon and enter into her life.

Foolish Daisy! She might have known how empty was all this momentary content. If the parting of last night had been, indeed, "good-by," and not "good-night," the soft, fresh wind might have blown upon her, the sun might have shone upon her, the flowers have sent forth their fragrance, and the birds their song, and all the beauty and sweetness of life would have been as nothing to her, or even as worse than nothing.

Presently came a click of the latch of the garden-gate, a step upon the winding, gravelled way, and then, as she knew before she saw, a face at the open window.

"I couldn't help coming to look at you; I had such a horrible dream about you last night."

"Don't tell it me! On such a morning one doesn't wish to hear of horrible things."

"Indeed, Daisy, I had no thought of telling it to you."

"I wonder what it was like, Kenneth?"

"As unlike you as possible, and it is a blessed thing, Daisy of daisies, to look upon you sitting there with your fresh morning face, and to know my dream was only a dream."

"He could dream nothing about me so bad as what is the truth," thought Daisy; but she said:

"What a morning it is, Kenneth! I feel as if I could be happy in the way the birds are, sitting singing in the sun, not conscious of yesterday, or caring for to-morrow."

He smiled. "Will you give me a cup of tea?" he asked.

"Indeed, I will. You look as if you wanted that, or something."

"I do want that, and something."

"Will you have it there, or will you come in?"

"I should be glad to sit down, I'm tired, so I will come in."

He left the window to enter the house.

"Just happy to-day, at least to-day," was what she whispered to herself, as she rang to order a cup and plate for Mr. Stewart. Mr. Stewart was so habitual a visitor at the cottage that his presence there, at any time, as yet, provoked no remark.

"Why, what a lot of letters!" commented Mr. Stewart, half jealously. "I didn't know you had any correspondents."

"I haven't opened them—I know by the outsides what they are. You shall know, too, if you will. This is from my dress-maker—this contains a packet of flower-seeds—this is about some books—and this," she paused, examined the postmarks, of which there were many, then tore that letter open—her face sharp with sudden agitation.

"Well?"

The expression with which she looked up was at once puzzled and relieved.

"A most perplexing letter! Surely not meant for me. It begins, 'My dear unknown aunt,' and ends," turning the letter over, "'your prepared-to-be-affectionate niece, Myrrha Brown.' I didn't know I had a niece. How can I have a niece? Surely it's some mistake altogether."

"Brown—Myrrha Brown!" Mr. Stewart meditated; then a sudden light broke upon him. "I think I can guess, Daisy, who she must be. The name, Myrrha, is as uncommon as it is, I think, ugly. It was, I remember, the name of your father's daughter by his unhappy first marriage."

"I had forgotten, perhaps I hardly knew, that papa had been married before he married mamma. I was so young when he died."

"Yes, and he was a reserved man, not likely to speak before you of such things. But he had a daughter, and her name was Myrrha, and she made a clandestine marriage, of which he strongly disapproved, running away from the French school at which he had placed her when he married your mother. I don't know that I ever heard the name of the man she married—he was an American, I remember, and they went to live among the French colonists in America. No doubt his name was Brown, and this correspondent of yours is their daughter."

"But, Kenneth, how could this girl possibly find me out?"

"That would be easy enough, Daisy, to any one knowing how to set about it. It is very possible that your father kept up some sort of communication with them, the Browns, while he lived: no doubt they had the address of his lawyer. I don't know that I should have any so distinct recollection of the name of Myrrha, had it not been for a most lovely miniature of that Myrrha, which used to hang in your father's dressing-room, when I was a boy and you were a baby. In later years it wasn't there. It represented a girl of about, I should think, seventeen, with a profusion of very fair, fine hair, with gleeful-looking blue eyes, and an exquisite complexion, rather pale, but tinged with a delicate shell, or wild-rose, pink. If the daughter is like the mother, she is a pretty creature. But what does she write to you about, Daisy?"

"I haven't been able to find out, Kenneth."

"May I try?"

"Of course you may."

Meanwhile he had taken up and was examining the envelope.

"It has been a good while on the road," he said; "it has been, among other places, to your old home, Daisy. What place is this—Littlehampton—where is that?"

"That is where nurse lives."

"Littlehampton is where nurse lives." Then he asked, eagerly, "Where is Littlehampton? How do you get at it? I should uncommonly like to see nurse again some day."

Daisy turned from crimson to white, then red again.

"I mean," she said, "that is where she did live when she was first married. I forget the name of the place she lives at now."

"I wonder why Daisy is telling me a falsehood? I think it would be better and more like Daisy to be truthful, and to trust me."

"Kenneth!"

Daisy was, at once, ashamed, pained, startled, and angry. But Mr. Stewart, who had spoken with an affectation of only thinking aloud, took no notice of Daisy's explanation, but appeared intent upon the reading of Myrrha Brown's letter.

"A clever young lady, I should say! I suppose you read the postscript?"

"I didn't know there was a postscript."

"Oh, yes, there is, and it contains the gist of the letter. It informs you that your prepared-to-be-affectionate niece, Myrrha Brown, is on her way to pay her dear unknown aunt, Daisy, a visit."

"To visit me, Kenneth?"

"To visit you, Daisy."

"I won't have her. I can't. I don't know her. Even if I did, I couldn't bear to have any one always about."

"It might be good for you, Daisy; she may be a nice girl, and you are too much alone."

"Good for me! It would be intolerable to me, Kenneth!"

"You'll get used to it, you shy little soul. For my part, I shall welcome Miss Myrrha Brown; her coming seems to me most opportune."

"Do you mean I must let her come?"

"I most decidedly mean you must let her come."

"Oh, Kenneth!"

"I don't think you could help letting her come. I think it probable she will be here before you could tell her not to come. The letter has been a good deal delayed. I should not be surprised if she were here to-day."

"Here to-day!" Daisy repeated.

Not ten minutes had elapsed, and they were still discussing Miss Brown, when "Behold she comes!" Mr. Stewart cried, pointing with a tragic air to an open vehicle, a "fly" from the small country-station, coming down the lane.

Daisy looked into Mr. Stewart's face with such unmistakable dismay in her own, that, instead of laughing at her, he laid a kind hand on her shoulder, saying:

"Courage, little woman! I will help you all I can. Don't let this young person think herself alarming enough to put Aunt Daisy in a flutter."

By this time the fly had stopped at the garden-gate, and there stepped out of it a tall, slight, young lady, elegantly "got up" in the style of the period; that is to say, with a picturesqueness somewhat theatrical, but still, on a graceful and piquant creature; so graceful and piquant, that one needs to be a somewhat stern moralist (or, what comes to the same thing, a crabbed old bachelor, whom no girl dresses to please, a sour and ill-favored old maid, whom conformity with such fashion would make ridiculous, or the father of many daughters, smarting under the too frequent and too heavy attacks upon his purse) to cavil at and condemn. Of course, there is a higher ground on which this style of dress may be considered objectionable; it is too evidently designed, not merely to please, but to attract, to be in harmony with any ideal of what woman's dress should be.

"What can I do with such a visitor in such a place?" Daisy exclaimed, as she went down the garden-path, followed by Mr. Stewart.

Miss Brown rushed upon her unknown aunt impulsively; demonstrations of affection, apologies, and explanations, followed each other with a rapidity that took Daisy's breath away. Then the visitor ran back to the gate to superintend the dislodging of her luggage.

Her "large box," as she called it (it was indeed large!) had been secured behind the vehicle in some wonderful and ingenious manner, and was now the subject of animated dispute between her and the driver.

Daisy had a gardener, but he was old and crippled; Mr. Stewart assisted the flyman in getting the "large box" through the garden-gate, and up the garden-path. In her excitement concerning her luggage Miss Brown had not yet paid that attention to Mr. Stewart which any man, as a man, generally received from her; she had jumped at the conclusion that he was Aunt Daisy's "butler, or something;" and Daisy was both mortified and amused to notice that she addressed and directed him with the same mixture of familiarity and imperious command she used toward the fly-driver.

"You can't think how glad I am to see a prospect of getting something to eat, Aunt Daisy. I'm most uncommonly hungry!" was Miss Brown's remark, as they went into the breakfast-room.

She dashed off her hat, and ran her fingers over her most picturesque dishevelment of hair, and then, putting her hands patronizingly on Daisy's shoulders, she said:

"Why, what a little young thing you look! I expected to see a gaunt old maid. Of course, if I had thought, I might have known

that you could not be old; but thinking is a folly that I'm not often guilty of, Aunt Daisy."

Then she turned her attention upon Mr. Stewart, whose easy attitude and amused smile had shown her he was not a servant. The air with which she regarded him would have been supercilious if her regard had been turned upon a woman; but no man was held by Miss Brown as quite unworthy some amount of complaisance.

"You have not done me the honor of introducing me to your niece," Mr. Stewart said to Daisy.

Daisy went through the ceremony.

"I'm sure I beg Mr. Stewart's pardon. In the bustle and confusion about that ridiculous big box—which I hope, by-the-by, hasn't terribly alarmed you as to the proposed length of my stay, Aunt Daisy—I took Mr. Stewart for your butler. I didn't look at him, mind you. I hope you aren't offended, Mr. Stewart?"

"Not in the least, Miss Brown; I should feel honored to serve your aunt in any capacity."

"That is very pretty, I'm sure, Aunt Daisy."

Here Daisy said a few words, explaining that she had only just had her niece's letter; that, therefore, nothing was prepared for her.

"Don't mind me, Aunt Daisy; I don't want to be made a stranger of; there was no need of preparation," Miss Brown was so good as to say.

Daisy left the room to give some hasty instructions to her servants. When she came back she found Myrrha chattering away to Mr. Stewart, questioning him about the neighborhood, and telling him of her journey; talking to him as to a familiar friend. It seemed she had come from no farther than London, where she had been staying some time.

"Mr. Stewart is just going to take me round the garden, Aunt Daisy; I suppose he may: he seems quite at home here."

Myrrha's glance was saucy and investigating. This was a case of old maid and old bachelor courtship, she decided; she thought that, possibly, some "distraction," some "fun," might be got out of interfering with it, if there should seem to be great dearth of amusement in the place. Besides, in Mr. Stewart's expression there was something that provoked her to wish to add him to the number of her "conquests;" he looked "stuck up," she thought, and his regard of her seemed to have in it more of curiosity and criticism than of admiration, as yet! After going outside with Mr. Stewart, Myrrha dashed back to say to Daisy:

"Is he your doctor, your parson, or your lawyer, Aunt Daisy? I ask, that I may know what to talk to him about."

"He is neither."

"What, besides you, is he much interested in?"

"He is interested in most things. He is fond of gardening, for instance."

"Dear me, and I don't know much about it. How unfortunate! but then I can ask him to teach me." And she danced down the garden-path to where Mr. Stewart was waiting for her.

Daisy's chief servant and manager, who had been her cousin's more than servant all her suffering life, having just encountered Myrrha, as she came in to rearrange the breakfast-table, stood aghast.

"Well, ma'am, I never; do tell now, is that how all the young creatures are done up in her country?"

"She's an English girl, Mrs. Moss, though I don't think she has lived much in England."

Mrs. Moss, still gazing after Myrrha, catalogued the peculiarities with which she was most struck.

"Half her hair right a-top of her head, the rest trailing down her back; no gown to speak of, nothing in one piece, all flounces and furbelows, petticoats puffed out behind, such stockings, and shows 'em pretty well, too! Law, ma'am, it's queer. I shouldn't like to see her in a very high wind; it appears to me her clothes would soon be flying off her." Then Mrs. Moss turned from the window, and attended to her own business.

The breakfast, for which Myrrha had professed herself so hungry, had time to be perfectly ready, and to get almost cold before they came into the house.

Myrrha had found a cluster of early apple-blossom, had broken it off, and stuck it in her hair.

She came and knelt down before Daisy.

"Does it do well there, Aunt Daisy? I know it does, though I haven't looked in the glass. Mr. Stewart seemed to grudge my pick-

ing it. Do you grudge it me, Aunt Daisy? I always wear flowers in my hair when I'm in reach of them. Roses suit me best, I think, wild-roses, or white garden-roses. Oh, I know what would become me better than this." She pulled out the apple-blossom and threw it on the table, and, making a dash out-doors, picked two or three purple wind-flowers.

"There, they bring out the yellow in my hair, don't they?"

"But then," Mr. Stewart objected, "they take the purple out of your eyes." At that she made a pouting grimace.

While she was outside, Mr. Stewart had said to Daisy:

"She has been trying very cleverly to find out who I am. She evidently can't accept me as just a gentleman—I mean as quite, in her sense, a gentleman. First she assumed me to be an artist, then an author: don't enlighten her, Daisy!"

"Now," said Daisy, "Mrs. Moss will be in despair if you don't do justice to the breakfast."

"Shan't I just do justice to it! I expect to astonish you, Aunt Daisy. I'm not one of those ethereal beings who can exist without mortal sustenance. Won't you call it lunch, and take something, Mr. Stewart? I'm really very hungry, and shall be ashamed to eat half I wish to eat if I have to eat alone."

Finding every thing "delicious" and "lovely"—cream, butter, bread, honey, chicken, ham, coffee, preserves—Myrrha ate and talked rapidly and largely, but managed, too, to do nothing ungracefully.

"Do you ride, Miss Brown?" Mr. Stewart asked, when Myrrha had been questioning him about the stretch of uplands visible from the window, asking whether there was good turf there.

"Always, when I can get any thing to carry me. Have you any horses, Aunt Daisy?"

"No, your aunt has no horses."

"You don't keep any thing a lady could ride, I suppose, Mr. Stewart?"

"Well, I can generally procure the use of a lady's hack when I wish."

"Oh, Mr. Stewart, I don't know what I won't do for you if you manage to get me some nice rides!"

"Bribed in such a splendidly indefinite manner, you may depend upon my exerting myself!" And now, Mr. Stewart took his departure, saying: "I must indulge in no more of this pleasant idleness, or I shall get into disgrace."

"With whom?" Myrrha asked inquisitively.

"With my master."

"Who is he? Who is your master?"

"Ask your Aunt Daisy."

To Myrrha's question Daisy only answered: "I should think Mr. Stewart is pretty much his own master."

Miss Brown, breakfast over, and Mr. Stewart gone, suffered a temporary collapse. She threw herself into an easy-chair, and yawned. She was silent, and looked quite thoughtful, for perhaps five minutes.

"After all," she said, "travelling at night does use one up rather. I dare say you wonder why I did travel by night, Aunt Daisy. The truth is, I had to leave where I was suddenly; the place got too hot to hold me. Can I help it, Aunt Daisy, if men will fall in love with me? And yet I'm always treated as if the fault was entirely mine."

"Were you staying with friends in London when this misfortune happened to you?"

"Yes, Aunt Daisy—at least, I may as well be frank with you—I was expected to talk French to the young people. You understand, I was not a governess, or a companion, it was a sort of 'mutual accommodation' arrangement."

"Oh yes, I understand."

Myrrha yawned.

"Would you like to lie down and sleep a little?" asked Daisy. "I don't think your own room can be quite ready; but won't you go to mine?"

"Presently, Aunt Daisy. Aunt Daisy, do you think he meant it about the rides?"

"Mr. Stewart generally means what he says."

"But is he a person who can spare the time?"

"I suppose he thinks he can."

"Then," with sudden animation, "I must rout out my habit and see into the state of it. I haven't worn it very lately. I'm afraid it will be in an awful tumble; my things were so horribly ill-packed.—Aunt Daisy, what a charming place you have here! It's a very small house, certainly; but then every thing is so pretty! I made Mr.

Stewart take me all over the garden, the orchard, and the meadow. Do you know, Aunt Daisy, I like Mr. Stewart uncommonly, though he is so queer-looking. Couldn't he afford to dress a little better? I hope he will when he takes me for those rides. All his clothes look so rough! It's a pity he shouldn't dress a little better, for he seems almost a gentleman."

"Mr. Stewart is quite a gentleman."

"Oh, of course, in one sense," suppressing a yawn; "but I meant conventionally speaking. Do you think he likes me, Aunt Daisy? I generally know directly whether people like me or not; but he puzzled me a little: once or twice I fancied he was laughing at me. Do you think he admired me?"

"I fancy, Myrrha, you are tolerably well aware that you're a pretty creature whom all men admire. As to liking—I don't suppose Mr. Stewart likes or dislikes you yet. He's not quick in his likes and dislikes."

"Most men do admire me, certainly; but not quite all. Shall you like me, Aunt Daisy? If so, I might stop with you always—at least, I mean till I marry—that would be awfully jolly. Do you know, Aunt Daisy, I'm not quite sure I will marry. It must be, in so many ways, an awful bore. If I could keep always young and pretty, I'm sure I never would; but when one gets old"—she was now leaning forward, elbows on knees, and quite in earnest—"when one gets to be neglected, and called an 'old maid,' and all that—well, I suppose that is not pleasant, Aunt Daisy, and that then one begins to wish for the dignity and position of a married woman. So, on the whole, I suppose I had better marry, by-and-by. Don't you think so, Aunt Daisy?"

"It is generally considered (marriage, I mean) the more desirable estate."

"But there's no hurry, is there, Aunt Daisy? I don't mean to marry very young; I mean to enjoy myself while I am young—amuse myself. One of the chief reasons why I came away from home was to escape from my lovers (I got into the same sort of mess in London, but I could not help it). I'm the youngest, you know, of the girls at home, and the only pretty one, and it really isn't fair to Jean and Julia that I, who don't mean to marry for a long time to come, should have all the men at my feet, while they, poor girls, who do want to marry—who are in a dreadful hurry to marry—are neglected. They're ever so much older than I am, you know; there were half a dozen or more boys between. It's very hard for them, and trying to their tempers, and makes their poor noses get red. I'm always so sorry for people who are ugly, Aunt Daisy; so I thought it only kind to start on my travels, and try to find a home. I made mamma come out strong on my toilets; I thought that only fair; I've got some that will quite charm you. That old woman in London had the impudence to tell me my dress was quite unsuitable to my position! I don't want to marry a Frenchman, or an American, Aunt Daisy; and the English one meets abroad are such a scrubby set. I tell you what I should like of all things—an English country gentleman, with a house in town. I'd be the queen of a county, set the fashions, and all that. And I'd be good to the poor, and—have you a headache, Aunt Daisy? Ah! you are not used to such rattle; but I shall do you a world of good. I'm a little dull and tired to-day; but, when I'm rested and in good spirits, I shall keep you amused. You'll laugh more in ten days of my being with you than you've done for the last ten years of your life. You have such a sad, grave look, Aunt Daisy; you seem quite to have forgotten that you're not old yet; and you seem to wish other people to forget it, or you wouldn't dress and do your hair in such old-fashioned style! What nice hair you have, Aunt Daisy! I wish you'd let me dress it as I do mine. Mr. Stewart says mine is a happy mixture of the fashionable and the picturesque! You'd be surprised at the lot of compliments I got out of him. I had to work hard for them, though. Yes, I like him, Aunt Daisy, and I mean he shall like me."

"I don't suppose he will find any difficulty in liking you, or will need any making. But, if it were not his will and pleasure to like you, I don't think you would find it easy to bend him to your will and pleasure, as you have, I suppose, been in the habit of doing with younger and more frivolous-natured men."

"I assure you, it is not only by young and frivolous men I have been admired, but also by men quite old and very learned. I don't think I should find Mr. Stewart difficult to subdue, if I set my will to doing it."

"What age are you, Myrrha?"

"Just past nineteen, Aunt Daisy."

"And not engaged, as I gather from your talk—"

"Not exactly engaged."

"And you have never been in love?"

"Not exactly, but—"

"What does 'not exactly' mean?"

"It means, Aunt Daisy, that I am wiser than you think me. The fact is, there are so many of them—"

"So many with whom you are almost in love, to whom you are 'not exactly' engaged?"

"There are so many of them in love with me, I mean. And there is more than one with whom I have felt I might fall in love, if I didn't take care. I know I ought to be a rich man's wife. I wished to see what I could do in England before committing myself to any one—so I ran away. Wasn't that wise?"

"Quite wise."

"Aunt Daisy, I'm afraid your headache is getting much worse. Now, do lie down, and let me take care of you. Let me bathe your forehead with eau-de-cologne. You don't like eau-de-cologne? How strange! What do you do when you have a bad headache?"

"Keep quiet. Nothing more."

"Perhaps I've tired you, as you're not used to me; but I know I shall do you a great deal of good in the end. Do you think my room is ready? Because, if so, I should like to unpack some of my things and to change my dress. Which of the servants can help me?"

"Not either very well this morning. I have only two—Mrs. Moss, who is housekeeper and manager, and a young girl, Jane. Jane can help you in the afternoon. What help you need now, I must give you."

"Of course, Aunt Daisy, I couldn't think of troubling you." Then, with a blank look: "If you have so few servants, Aunt Daisy, who will do my needlework?"

"There's a very fair seamstress in the neighborhood."

"Oh, horror, a country seamstress! By my needlework, I don't mean making linen—that wouldn't matter. I mean little tasteful things—putting on laces, and running on ribbons, and altering trimmings, and that sort of thing."

"Can't you do those yourself?"

"I've never tried."

"Suppose you marry a poor man?"

"Aunt Daisy, I'm not a fool."

"I know, my dear, you don't mean to do that if you can help it, but if you should be so unhappy as to love a man who was not rich."

"I shouldn't marry him; but I don't believe in falling in love against one's will and conviction. My mind is, I hope, too well regulated for there to be any danger of my doing that." She said this standing, hat in hand, very erect, full of the sense of her own dignity and wisdom, the pretty, gleeful eyes fired with resolve.

"She is pretty," thought Daisy, as she admired the flower-like set of the head on its slender white stalk, the slight gracious figure, the lovely coloring. "Such a child, too, and evidently so badly brought up! There is no hidden harm in her, I should say; all the folly and wordliness are outspoken. I wonder if we can be of any use to her—Kenneth and I? Kenneth, if he got influence over her, might improve her." A heavy sigh. "How could I hope to improve any one? Let her be vain and worldly as she may, she must still be a more true and innocent creature than I am!"

MY ONLY ROMANCE.

I HAVE often wondered whether the four walls of the sleepy, solemn, old granite structure, towering far above all surrounding buildings, and facing the equally sleepy old square, have endeared themselves to the other inmates as they have to me. Every stone in them, from doorstep to pinnacle, is precious to me. Every breath of air that stirs the ivy-leaves, clinging with an almost human devotion to the ancient gray sides, and twining tenderly round the little Gothic windows, seems to murmur a fresh, sweet song to my ears.

I admired it first as a boy, when I used to go there for daily lessons, and, standing on the sidewalk, would look up to the roof, trying to

fancy how long the old pile would stand there after I was dead, and after others who should follow me were dead also. When the other streets about the deserted square should awake into busy life, echoing to the tread of hurrying feet, and the fine old residences be turned into gay shops, or be torn down, to make room for rows of costlier and more commodious storehouses, would it stand there still, wrapped in impenetrable dulness, quietude, and repose?

You see my liking for the place grew with my growth, and strengthened with my strength. Therefore, it was quite natural on reaching man's estate—the estate, in my case, consisted of a much-bedaubed pallet, a few brushes, and a quantity of canvas—and, deciding to make landscape-painting my profession, that, looking about for a shelter for my, as yet, nameless head, my thoughts should fix upon the roof which, in years ago, had so often covered my curly pate while listening to the dreary old professor endeavoring, with praiseworthy diligence, to instil into my unappreciative brain the elements of Latin and Greek. In two days after the idea entered my head, I was established with all my worldly possessions—a small trunk and an easel—in a delightfully musty, dark old room full of the weird charm that hangs over and penetrates even the very stones of the outer walls.

Another reason why I love the sombre and antiquated place I haven't mentioned yet. There my little romance, the one romance of my life, began, continued, but will not end.

I had lived an uneventful bachelor-life in the building for more than two years, vagabondizing during the warm months among the mountains, and along the coast with a few brother artists; and working hard in winter filling out, copying, altering, and improving, the summer sketches with which my portfolio was always laden to overflowing.

One evening at dusk, late in October, I had returned from a day's trip to the country. I had had a last look at the magnificent wealth of scarlet, and orange, and crimson, and green glory of the woods, where every leaf had danced and played, infiltrated through and through with the warm drops of golden light the sun was showering down. An autumn picture was on my easel, and I felt that, for a day at least, I must steep my senses in the intoxicating mystery of color before I could venture to add the last touches and pronounce it done.

I bade the janitor's wife good-evening, took my key off the nail in her small sitting-room, and started to go up-stairs, when I met with a great surprise. Not at all a disagreeable surprise, for it wore a soft, gray dress, a thick shawl, a round hat with a veil thrown back over the crown, and was toiling up the long staircase with a couple of bundles of wood in one hand, and a tin pail in the other. Numerous brown-paper bundles protruded in all directions from under its round arms, or rather what I immediately fancied were its round arms. A woman in that place was such a very rare vision that I was impelled to follow her, and raising my hat to say: "I beg pardon, madam, pray allow me to assist you."

Two large, startled eyes looked up into mine as I spoke, and then, seeming reassured, a sweet, modulated voice answered: "Thank you, sir; I will accept your kind offer, for I am continually stepping on my dress; and, at this rate, I shall never reach my room."

"Your room!" I involuntarily exclaimed, as I took the pail and bundles of wood. It was such a very odd idea that a lady should have a room in that out-of-the-way place.

"Yes, my room," she said. "I live in number twenty-eight, north corridor, third floor. My brother was too ill to go out to-night, so I am going to get tea for us there."

"Then we are neighbors; my room is number twenty-seven, same corridor," I remarked, more and more mystified.

"Oh!" she exclaimed, "then you are the gentleman whose picture old Margaret praises so highly."

"Indeed," I said, laughing, "I had no idea our good janitress admired my poor work."

"You are her greatest favorite among all the artists in the building. But here we are at my door. If you will excuse me while I step in and put these bundles down, I won't detain you a moment longer."

I heard a weak and tremulous call inside the room: "Gervaise, is that you, dear? It seems," in a half-querulous tone, "a long time since you went out."

"Poor Bertie," the sweet voice I already knew replied, "I was just as quick as I could be, darling. I'll try not to be so long another time."

Then, as she opened the door wider to take her things from me, the

light poured out, and she cried: "Oh, oh, oh, how beautiful!" as she looked at a great bunch of gorgeous leaves I held, and which she had not observed in the dim halls. "Please step in one moment, and show them to my brother.—Bertie, this is Mr. Churchill, our next-door neighbor, who has very kindly helped me to bring up my many packages." Then, turning to me, she said: "You see, sir, we know your name very well. This is my brother, Mr. Dale."

"And I hope you will know me, as you do my name very well, some time," I answered, bowing to the sick man in the arm-chair. "I have been out in the woods all day, filling my brain and being with the marvellous beauty of the season; and I have, as usual, brought home twice as many branches as I need; for I could not leave them behind. I dare say I should have tried to bring a cart-load, had not my conscience warned me that it was positively inhuman to break off any more. I see you enjoy them as much as I do, and," turning so as to see her full face, "I am going to ask your brother to do me the favor of taking care of half these leaves. My bachelor establishment affords but one vase, which will hold only a few of them, and I was wondering what I should do with the rest."

A certain dignity in the manner of the young lady, while it was extremely gracious, repelled the slightest deviation from the most formal courtesy, and prevented me from offering the leaves to her. I feared she would decline them, and I had taken an odd fancy that it would be very satisfactory to know that my visit to the woods had given pleasure to some one besides myself. Indeed, it must have been almost the only time within my recollection that I had ever given any satisfaction to anybody; for my life then was almost wholly isolated. As I divided my woodland treasures, the invalid raised his long, slender hand, and, offering it to me, said: "I thank you very much, sir, for both my sister and myself. I am sure we shall enjoy them enough to repay you for the sacrifice of giving them away."

"But the gain is mine," I replied, smilingly; "for now, you see, I shall have the pleasure of knowing that these beauties will be properly cared for. Just look at that scarlet maple with the perfect gradation of color to the orange veins, and the sumachs; perhaps they and the golden beeches are the handsomest, after all. If I had kept them, they certainly must have withered in a few hours. In two days my picture will be finished. Will you and your brother do me the honor of looking at it before it goes to the exhibition?"

I turned so quickly toward her in saying this, that the lady was startled into accepting the invitation, though I believe to this day she intended to decline.

"Thank you," I said; "when it is ready, I shall call for you. Good-night."

When the door closed behind me, I struck a match, and, holding the little, quivering flame quite close to a small, white card, tacked upon the middle panel, read:

"G. DALE,
"Engraver on Wood."

Whether I had suddenly grown more fastidious and critical, or whether my practised fingers had all at once lost their cunning, I cannot determine; but I do know that the two days allotted in my mind to the completion of the autumn-scene upon my easel stretched out into three, four, five; and finally a week passed before I was willing to say "Finished!" and put it in the frame.

But one thing should be considered in extenuation of the delay. My brain had played me the most extraordinary tricks during those seven days. Would you believe that, on awaking from a highly-artistic and analytic reverie one afternoon, I discovered under a group of oaks and beeches, where a dwarf gum-tree should have been, a slight figure in a gray dress, shawl, and hat, with a veil thrown back over the crown?

I see, by your smile, you don't credit the story; but, I assure you, it is true. The picture was finished, however. I took it off the easel to hang it on the wall; pulled it down from there, and, bracing it up on the table with a pile of books, I at last replaced it on the easel, where it properly belonged, before I could be satisfied with the light. After all this, I found myself at number twenty-eight, ready to escort my visitors to my studio.

The slight color that flushed Herbert Dale's face told me, before his words, that he liked and admired my work; but I was not so sure of his sister's approval. For full five minutes she stood leaning over the back of her brother's chair, saying nothing, while I remained in

the background watching the flickering, western sunlight play over her soft, blond hair and delicate sweet face. At last, with a sigh as of mingled longing and regret, she turned and took the chair I silently moved toward her, saying: "It seems to me as perfect as any human hand can make it. You can't imagine how it makes me wish for the country and the woods."

Then she was silent again; but I think my eyes must have said more to her than my lips, for they only uttered, "I thank you."

Of course, we naturally began speaking of pictorial art in all its departments. She told me her brother and herself both drew, and that she engraved their pictures. And I gathered, though she didn't say so, that she supported the two in that way. My interest in this couple, who seemed as much alone in the world as myself, grew every moment they remained; and, long before she exclaimed, "Why, Bertie, dear, it is nearly dark! we must go home this minute," I determined to follow up the acquaintance which had begun so propitiously. Rising to help Herbert back to their room, I asked: "Miss Dale, have you ever seen the 'Seasons,' illustrated by Ludwig Richter?"

"No. I never have had an opportunity, though I have often read about them. I hope some time to be able to buy the set; for I think they would be very helpful to me."

"I think they would be very suggestive to you in many ways, while they are also exceedingly entertaining. When mine are returned by another friend"—I laid the slightest possible accent on the two last words, to see what effect it would have upon her—"may I bring them to you? I rarely open them now, for I know every line and every group by heart."

"Thank you; I should be very glad to see them," she replied, without seeming to notice my emphasis. And then I went out, and stood alone in the gloomy corridor, as I had stood a week before, on the evening when I first met Gervaise Dale.

In a few days my books came back, and I seized the first moment of leisure—it was in the evening—and carried them next door. The call was delightful. The loan of more books, the exhibition of a sketch or two, led to another and another visit; and at last it became a habit with me to spend three or four evenings a week with the Dales.

Up to the time I made the acquaintance of my new friends, my life had been utterly selfish. Every sensation and circumstance had been interesting to me only as it affected my own personality. Every thought and every hope centred in my own advancement and success. Therefore, the self-sacrifice and devotion of Gervaise Dale to her sick brother awoke in me a feeling of surprise and admiration that at the time was almost inexplicable. As a revelation of nobility of character, it appeared in my eyes superhuman.

Herbert and I became much attached to each other, as our acquaintance grew; and frequently, in the short winter afternoons, while Gervaise was out carrying home her work, I read aloud to the unfortunate youth.

One day we were sitting quietly watching the sun sink behind the leafless trees in the lonely park, when he suddenly burst out with:

"Mr. Churchill, I suppose you've often wondered why Gervaise and I should be alone here. I think you ought to know our history, or at least whatever will interest you in it, and I am going to tell it to you."

"Don't tell me any thing you would rather not speak of, Bertie," I said, laying my hand on his; for I knew how hard it is for sensitive natures to open their souls even to their nearest and dearest, and I could not bear he should think me vulgarly curious about their past life.

"I want to tell you. In the first place, Gervaise is an angel."

My heart echoed that, as I looked toward the table in the window where her blocks and pencils and little instruments lay, and thought how cheerfully and uncomplainingly she toiled there, hour after hour, and day after day, to provide for their small needs.

He continued:

"It is the old story of parents dying penniless who are supposed to be wealthy, and of children left to the charity of rich relatives who could hardly have been less generous to their bitterest enemy."

The hot blood rose in his wasted cheek, and burned in his smitten eyes, as he uttered the last sentence; and it spoke more strongly than a thousand words of the indignities put upon them in the home to which they were unwelcome.

"My uncle, who was left our guardian, is a passive, easy-going man, entirely under the control of his clever and unscrupulous wife. I have had hip-disease ever since I can remember, and so, of course, when we were taken to our guardian's house, I was looked upon wholly as a burden, to be endured, not enjoyed. But Gervaise, who was always well and strong, they made slave herself nearly to death, and she cheerfully submitted for my sake.

"Again and again I implored her to run away with me somewhere, if it were only to die in the street, for the sake of getting out of that house. Oh, you can't conceive how I loathed the place, how I longed to get away with Gervaise! That was the question which occupied our minds constantly. I don't know whether it would have been solved to this day, had not my uncle and his family decided to go abroad. Of course, we were left behind. I was glad of it, but Gervaise was not, for she thought travel would have benefited me.

"I knew then just as well as I do now—though I didn't tell her so—that nothing in this world could ever help me, and life in its best state has never been such a blessing that I would try to keep it if I felt it slipping away."

He smiled a sweet, melancholy smile that pierced my heart, and I could only press the thin fingers that lay in mine.

"My one sorrow is in leaving Gervaise all alone; but time heals almost any wound, and I hope some time she will be loved as she deserves by one who can be more than a brother to her.

"But to go back. My guardian's family went away, leaving Gervaise in charge of the house and to take care of me. We felt that that was the time to act, and we revolved a hundred plans by which Gervaise was to learn as many different means of making money.

"Yes, that was the bitter fact. I, the man, the natural provider, must sit with folded hands and wait. You may imagine how I cursed the malignant fate which made me impotent to support the darling girl I loved so well," he went on, vehemently; "you don't know how I have learned to sympathize with women since I've been sick all these years. Great Heaven! I wonder they will consent to live at all, for they must always be the watchers and waiters, and rarely the actors in life.

"Well, nothing that we thought of seemed feasible, and I was nearly desperate from disappointment, when the doctor who attended me suggested that Gervaise should go to the institute and learn wood-engraving. You see we were both already proficient in drawing, my sister especially; for, as long as our parents were alive, we had the best of instruction, and had natural talent for it besides. Of course we received the idea with delight, and after the doctor, who was and is our only friend besides yourself, had made the necessary arrangements, Gervaise began the lessons.

"Perhaps you know what a wonderful aid to all labor necessity is. If you do not, we do; and not many months elapsed before Gervaise could cut her own designs on the blocks with great skill. When she began to be paid for her work, I begged her to leave that house with me; but her sense of honor, which in that case I confess was greater than mine, would not allow her to consent; so we stayed till our guardian returned from Europe last spring.

"Gervaise, meanwhile, had become of age, and it was not very difficult to persuade my uncle"—this with a bitter smile round the thin, drawn lips—"to let her take me, a useless burden, off his hands. The doctor found this place for us—that little inner room, you know, is mine—where we could live absolutely to each other, and not be annoyed by curious eyes.

"At first I could help Gervaise a good deal in drawing; but I am slowly growing weaker, and less and less able to do so. And I can't go out to our meals as I used to. She thinks it is only the winter weather, and that when the robins and the violets come again, I shall be as well as I have been; but I know that the next violets will blossom on my grave, and the robins will sing my requiem."

After this we sat quiet a long time, till the red, western flames faded into yellow and then into gray, and at last Gervaise came in.

Bertie's little history had opened the door of my heart as with a magic key, and looking in I found there a great love for these two lonely and homeless ones, like myself, without ties. But the love for each was quite different. I felt for Herbert a strong, brotherly affection; but for Gervaise—ah, yes, for Gervaise!—the utterly longing, thrilling tenderness a true man feels for the woman into whose hand he wishes to lay the treasures he holds most dear—his happiness, his honor, and his name.

The days slipped by. I could see how rapidly Herbert Dale lost his hold on life; how swiftly he was sinking into eternity. My visits to them were more frequent than before. I was filled with a fierce desire to keep the truth about her brother's health as long as possible from Gervaise. If she suspected it, she did not speak. I felt that it was no time to tell Gervaise my love, to speak of another future. These last days of her life with Bertie, which I could see so well would be few, very few at most, should be wholly theirs. I determined to control my heart till she needed its tenderest ministrations in the days of darkness and sorrow that were certain to come.

A raw, gusty afternoon in February, Bertie and I sat again alone. He had been reading "Dombey and Son;" and, as the fading light grew dim, I closed the book after the chapter about Paul's death. We were filled with the sweet pathos, the tender grief of the scene, and perhaps tracing in our minds a resemblance between the loves of Paul and Florence, and Bertie and Gervaise, when he suddenly asked, laying his hand on mine, and searching my face with his eyes as if he would read my soul: "Charles"—you see he and I used each other's Christian names altogether then—"do you love Gervaise? Not as I love her, I mean, though Heaven knows how love could be greater than mine! but as a man loves the woman he wants to make his wife?"

Wondering if with all my care I had betrayed my heart-secret, I laid my hand over the thin, trembling fingers, and answered: "Who could see Gervaise as I have seen her, know her as I have known her, and not love her, Bertie? You know not how I long to make her my wife; to take her in my arms and fold her away from all sorrow and trouble for evermore. But how did you find me out, dear boy? I had resolved not to breathe it to her till—" checking the words upon my lips.

"Till after I am gone," said Herbert, finishing my sentence with a sweet smile. "Eyes less jealous than mine might have discovered the truth long ago, Charles, had they been watching you as I have. But I will tell you why I spoke first about it. It would be the greatest satisfaction to me if you and she could be married before I say good-by to you both. I should die absolutely happy if I left her your wife. A few weeks at most is all of life that remains to me. Go out and meet Gervaise, tell her your love—I am sure she returns it—and my wish. Go, Charles, now."

Stooping to kiss his pallid cheek, I whispered: "Thank you, Bertie, for sending me. I would not speak without your consent, but now I can hardly wait to find her."

The lamps were beginning to be lighted when I descried the little gray figure far down the street, and hurried toward it. My heart was full, my mind was full of the one thing I had come to say; but I began in the most commonplace way by offering my arm, and saying: "You are late to-night, Miss Gervaise."

"Rather," she replied, absently.

And then, speaking no more, we walked rapidly on. We had almost reached the old square when, plucking up courage, I said: "Gervaise, I came to meet you to-night, to tell you something which has been in my heart to tell you many a night before when I have come to meet you. But I fancied it was right it should remain unspoken until—until what I have to say would not make even the slightest barrier between you and Bertie. But now I have his consent to tell you of my love, and ask you to be my wife. Do you love me, Gervaise?"

We had wandered into the park by that time, and I drew her under one of the scattering lamps, and with both hands turned the sweet face upward to the flickering light, and read in the speaking eyes the answer I longed to hear.

After we had paused in silence—how eloquent that silence was!—under the gaunt, leafless trees, I told Gervaise, as gently and tenderly as I could, that Bertie's death was very near, and that he was as anxious to leave her my wife as I was to make her so, and pressed her to say when we should be wedded.

"Don't ask me to-night, Charles, please," she pleaded, clinging convulsively to my arm, "there is such a strange mingling of supreme happiness and bitter grief in my mind and heart that I cannot think. I have known so long, dear, that Bertie must go, and yet I have tried to deny the evidence of my own eyes, and to school myself to bear it at the same time. Let us go to Bertie. Every minute with him is precious to us both now."

Three days later, on a beautiful afternoon, when the glimmering

sunbeams fell lovingly on my darling's golden hair, we were united by the sweetest and solemnest of all ceremonies. Ere our wedded happiness was a week old, we were called upon to mourn over a gentle spirit, who, though dead to the world, will always live to me, and to her, I am as happy now to call my wife as on the day I first pillowed her blessed head upon my loving heart.

LILIAN GILBERT BROWNE.

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

III.

A PEEP BEHIND THE HAREM-CURTAIN.

AN English poet, whose "Palm-Leaves" contain the truest and most graphic pictures of the East, has embodied the imaginative idea of the Eastern harem-life and its theory in the country of its adoption:

"Behind the lofty garden-wall,
Where stranger-face can ne'er surprise;
That inner world, her all-in-all,
The Eastern woman lives and dies.
Husband and children round her draw
The narrow circle where she rests;
His will the single perfect law,
That scarce with choice her mind molests.
Their birth and tntelage the ground
And meaning of her life on earth—
She knows not elsewhere could be found
The measure of a woman's worth."

Such is, undoubtedly, the theory of the harem, that "woman's mission" is not to meddle with the business of men, but to devote herself strictly to her domestic duties as wife and mother; comforter and consoler of her rougher and sterner mate. This theory is carried out as far as the infirmity of human nature will permit, and it cannot be doubted that the Eastern women are not only contented but very happy in their ignorance of "woman's rights" and the "true sphere of woman," as defined by the most eloquent and determined of our strong-minded preachers in petticoats and their weaker brethren in pantaloons.

The woman's apartment, or harem, is, indeed, a secret and shrouded spot, and into it the foot of no man, save the master, may penetrate. The sultan himself, nor the Viceroy of Egypt, dares enter the harem of the meanest of his subjects, and even the officers of justice cannot penetrate its recesses. Hence, in a country where the rule is so arbitrary that neither person nor property is ever secure, the harem is a sanctuary, a place of refuge for its owner, so long as he is within its precincts. Here, too, he may secrete his valuables, and often the wealth of a man is to be found safely invested in precious stones, which adorn the persons of his wives.

Even his own brother is never permitted to see the faces of his wives, nor to pass the threshold of the harem; and his son, after ten years of age, is strictly excluded also, except from the apartment of his own mother. Much of the time of the Oriental is spent in the society of his women, who are absolute within their own domain, and, if Eastern gossip say true, hen-pecked husbands there are the rule, and not the exception. The influence of woman is very powerful there as elsewhere, in spite of this seclusion, and even in public affairs is strongly felt. If a man has many wives (and his religion allows him four, with a facility of divorce which even Indiana may envy, and as many handmaidens as were permitted to the patriarchs), each wife has her separate apartments. The Egyptian or Turkish gentleman, therefore, has several different families under his roof, with whom to while away his leisure, each separate family hating the others cordially, but all vying in their attentions to him.

The Prince Halim, uncle to the present viceroy, an educated and accomplished man, attempted to brave this prejudice against the unveiling of the female face at home by allowing his young daughter once to sit at table with uncovered face among some European guests. But the popular outcry which this incident created, even against a prince so well-beloved as himself, proved how deeply rooted that prejudice is at Cairo.

When, therefore, a foreigner and his wife visit an Egyptian family, they are separated at the door of the house, and rejoin each other

there afterward, having been respectively received and entertained by host and hostess on the separate system in different parts of the dwelling.

We have had many vivid pictures of the interiors of the harem from many female pencils, portraying all its lights and shades, and so little do habits change in the East that Lady Mary Wortley Montagu's sketch, taken so many years since, is still as correct as when that lively lady wrote it. These "lights of the harem" are usually uneducated—one who can even read or write being an exception—but, as most of the men are as little literary, signing their names by a seal they wear on their little fingers, that does not matter much. There are exceptions; for the wife, or princess, of Said Pacha, the late viceroy, was not only an educated Circassian, but a poetess of no mean merit also.

But, from the most reliable accounts, the great majority belong to the party of know-nothings, and rejoice only in the unwritten chronicles of the bazaars, the baths, and the harem, where chat and scandal are as incessant as in more civilized circles. These "lilies of the valley"—white, black, and spotted—"toil not, neither do they spin." They shun all exertion of mind or body, except in the duties of maternity; for they are devoted mothers, and have devoted children. Never, in any part of the world, have I witnessed such reciprocal affection and reverential respect between parent and child as in the East. That system cannot be all evil which bears such fruits, utterly opposed as it may be to all our prepossessions. But indolence is bliss with the Eastern woman as with the man. We have no word to express what they call *kuff*, which denotes a state of perfect animal and intellectual rest, where all the senses seem steeped in the soft, luxurious languor of the lotos-eaters. The Eastern woman, therefore, is not "accomplished." She neither plays, nor sings, nor dances. She causes her slaves to exhibit all these before her, while she sits languidly inhaling the perfumed smoke of her nargile. To do any of these things herself would be to assimilate her to her slaves. Hence the high price demanded by the daughter of Herodias for her condescension in making such an exhibition when she danced off the head of John the Baptist.

Eating sweetmeats, drinking sherbets, smoking nargiles, and sleeping much, consume most of her time not devoted to the care of her children. She has no other household duties, unless she be too poor to have slaves or domestic servants, and the greater anxieties of European housewives, in relation to receiving and entertaining their husbands' friends, the Eastern women entirely escape. Their society is exclusively among themselves, and, when they meet at each other's houses or at the bazaars, veiled and guarded by eunuch or old woman, or on Fridays, when they spend the whole day at the public baths (*hammans*), they interchange gossip and scandal as freely as though they had weekly receptions or gave grand balls to Society (spelled with a large S). In fact, the foreign ladies who visit them are often astonished at the accuracy and extent of their information as to all that is going on out-of-doors, even among the European population, and are often more amused than edified by their revelations. So impossible is it to keep the softer sex from talking scandal! Equally impossible also is it to keep them from love-making, for even "bars and bolts cannot a prison make" which woman's wit cannot defy. It must be admitted that the Eastern woman has a perfect passion for intrigue, and agrees with the ancient Spartan that the guilt of a sin is in its being found out.

The air of Eastern towns seems redolent of intrigue, which occupies much of the thoughts and time of these caged birds, whose cages seem so secure, and whose male and female watchmen are apparently so vigilant. Yet these poor-spirited creatures, to whom not only the practices but even the precepts of Sorosis are utterly undreamed-of things, are actually proud of the precautions taken by their lords and masters to secure their fidelity and fetter their free will. They actually compassionate and condole with their freer Frank sisters on the masculine indifference which alone could permit them to go abroad freely, with unveiled faces, to be seen of and converse with all men! Sentiment (as we understand it) is a stranger to the mind or the breast of Eastern man or woman, for it is a hot-house plant, which requires for its growth the warmth of home-training and religious instruction, and the soil of a cultivated moral and intellectual nature.

The child of an animal mother, reared up in such an atmosphere, and amid such surroundings, intrusted from infancy to early puberty

to her control, and as destitute of moral or intellectual training as herself, how can he be other than the man he becomes?

This is the dark side. See the sunshiny one exhibited by the pencil of the poet of the "Palm-Leaves:"

"If young and beautiful, she dwells
An idol in a secret shrine,
Where one high-priest alone dispels
The solitude of charms divine;
And in his happiness she lives,
And in his honor has her own,
And dreams not that the love she gives
Can be too much for him alone.

"And when maturer duties rise
In pleasure's and in passion's place,
Her duteous loyalty supplies
The presence of departed grace.
So hopes she, by untiring truth,
To win the bliss, to share with him
Those glories of celestial youth,
That time can never taint or dim." *

But we have left our side of the house to wander over forbidden ground, the forfeit for which would be life, if detected, and so must escape. The reader must pardon us for taking him where female feet alone are permitted to tread, even by the most hospitable Eastern host. But it was necessary to unveil that portion of the life of the Egyptian gentleman he never voluntarily will show you, the curtain of which he will never raise for stranger-eye to penetrate.

Let us now return to the prince, and see how he usually passes his days at home.

INTER COENAM.

ALL the world is sunk in slumber
As I sit in my garret high,
While the solemn stars shine sadly
Far up in the midnight sky;
And I muse through the night's dark watches—
All the house so hushed and still—
With a meek slave standing silent,
To wait on my lordly will.

Then I say to my dumb slave straightway,
Go—set me the royal chair!
Go—bring me the lordly purple
That is fit for a king to wear!
Lo! swift as a viewless spirit,
He hath done my high behests;
And I sit in my garret-chamber
To welcome my royal guests.

Then up to the bare brown rafters,
And sweet through the misty gloom,
Float the scents of the golden summer
When the fields are all abloom;
And I hear on the world's great anvil
The clang of the heaven-forged swords;
With "Strike for the truth, O brother!
For the triumph is the Lord's!"

Then far from the vanished ages
Do the shining cohorts rise;
With him of the regal forehead,
And him of the sightless eyes;
There the lord of the Tuscan laurels,
With the bard of the boyish days;
While the mighty master, smiling,
Stands crowned with his English bays.

So, all through the solemn stillness
Do I drift with the drifting tide,
All alone with my soul's great comrades
And with one sweet dream beside;

* Their future union depends on his will, though not her future state of reward or punishment.

While we sit at the royal banquet
Where the vintage is divine,
And purples the golden goblets
That brim with the beady wine.

Slow the wondrous pæan rises,
As I chant with the mighty throng;
And I join with my humbler music
In the chorus of the song;
Till the notes ring grander, clearer,
While my lamp burns dimly down;
And I see in its dark penumbra
The gleam of a kingly crown.

So, drunk with the purple vintage,
I rise from the royal feast,
When the rosy tints of morning
Just brighten the drowsy east;
But still through the day's stern labor
With its doubts, and strifes, and pain,
Do I long for the night's great banquet
When my cup shall be crowned again.

Then how shall the rude world harm us
With its praises or its blames,
We, priests of the Truth's proud altars,
And peers of such lofty claims,
Who, crowned with the rosy chaplets
'Neath the sheen of angels' wings,
Sit quaffing the wine of welcome
At the banquets of the kings!

EDWARD RENAUD.

FREDERICKA BRION, GOETHE'S FIRST LOVE.

"HAPPY is he," says Schiller, "whom the gods love, even before his birth; whom, as a child, Venus cradles in her arms; whose eyes Phœbus anoints, whose lips Hermes touches, upon whose forehead Jove presses the seal of power. An exalted destiny shall be his, for, ere the beginning of the conflict, his temples are wreathed with bay."

Such a favored one of Heaven seemed Goethe, whom Germany recognizes as her greatest genius, and to whom the world might justly assign a place, among modern poets and dramatists, second only to that of Shakespeare.

The only son of a rich banker and imperial counsellor, JOHANN WOLFGANG VON GOETHE was born at Frankfort-on-the-Main, in the year 1749. To this, her "Sunday child," her darling, Nature came laden with the choicest gifts. Beauty, wealth, genius, friends, station—all were his. Life was to be to him *no via dolorosa*, up which he must toil, bearing the cross of neglect and penury. The bitterness of feeling his best efforts unappreciated, of seeing his best thoughts fall cold upon the public ear, were never his. Poverty, which eats into the sensitive soul of genius like a canker, and is sure to sadden if it does not harden, he never knew. The upward path was made smooth for him, while proud, loving friends stood by to aid him in every earnest work, to cheer him on to every high endeavor.

Had he been less the grand, noble genius he was, he might have become the spoiled child of affluence and adulation. But he had aims in life higher than pleasure, broader than power, and he could not turn a deaf ear to the voice within, urging him on to grand and lofty things. Conscious of his splendid gifts, he heartily and exultantly set about his appointed work.

"Oh, his pride, his sacred pride in his beauty!" writes "the Child," Bettina von Arnim; and the outward casket was indeed worthy of the princely soul it enshrined. The form, above the medium height, was that of a stalwart Hercules, while the face and head had the ideal beauty of an Apollo. The brow was high and massive; the features were clear and finely cut, as in the models of classic art; the eyes large, deep, and lustrous; the complexion fresh and glowing. It is said that his personal appearance was so striking that, whenever he

entered a public place, even as a stranger, all eyes were at one fixed upon him.

In youth he was a wild, adventurous fellow, whose slight regard to worldly conventionalities greatly outraged his precise, pompous old father. With years his manners grew courtly and dignified, even haughty; but his haughtiness was not that of the *parvenu* or coxcomb. He could look beyond the surface, and his respect for men was not based upon the station the world assigned them. Worth and talent guided him in the choice of friends, and, to those he chose to fascinate, he was through life the most fascinating of men.

But this man, so favored by fortune, so exalted by genius, so idolized by his fellows, was, after all, a man with the usual weaknesses and frailties, and, among his greatest faults, was untruth to the better feelings of his own heart. Courtied and caressed by all, he was an especial favorite with women, and, being much in society, he could be neither blind nor deaf to their admiration. Of a susceptible, impulsive nature, from youth to middle life he was continually falling in love. As he loved readily, he forgot easily, and most of his attachments of this kind were very transient; but there was one deeper and more enduring—his first *real* love, and his best. Of this we purpose to speak briefly.

In his twenty-second year young Goethe went to Strasbourg to complete his law-studies at the university. One pleasant October day he was invited by his friend Wieland to ride over to Drusenheim, a lovely country-village, lying in one of the most delightful regions of Alsace, and pay a visit to Pastor Brion, the spiritual shepherd of that rural community.

The Brions, in their simple, refined, cheerful home-life, forcibly reminded the young student of the charming family in Goldsmith's "Vicar of Wakefield." In Pastor Brion and his excellent wife, he saw the good vicar and his spouse; Salome, the elder daughter, he called Olivia; Fredericka, the younger, Sophia; and, when the only son and brother appeared, he could scarce help exclaiming, "Moses! and are you here, too?"

Fredericka, a romping young girl of sixteen, upon his arrival, was, as usual, absent on her out-of-door wanderings. After a while she came tripping into the room, apparently not at all awed by the presence of the aristocratic young gentleman from the city. She was a bright, blithesome young creature, and the fresh, piquant style of her beauty was greatly enhanced by the charming dress she wore—the old German costume, seldom seen outside the rural districts—a bodice tightly fitting the form; a short, full skirt, displaying the neatest of feet and ankles, and a black-silk apron.

"There she stood," says Goethe, in his "Wahrheit und Dichtung," "on the boundary between country beauty and city belle. Slender and airy, she tripped along as if she had nothing to carry, and her neck seemed almost too delicate for the luxuriant braids of flaxen hair on her elegant little head. A free, open glance beamed from her calm, blue eyes, and her pretty little turned-up nose peered inquiringly into the air with as much unconcern as if there could be nothing like care in the world. Her straw hat dangled on her arm, and thus, at the first glance, I had the delight of seeing her perfect grace, and acknowledging her perfect loveliness."

With his usual impetuosity, the young man fell in love with Fredericka at first sight, and every subsequent meeting only added fuel to the flame. Pastor Brion's house was but a few miles from Strasbourg, and Goethe's visits there became very frequent. During these visits he and Fredericka were inseparable companions, and soon came to be regarded by all as lovers.

Fredericka, a perfect child of Nature, was never so happy as when in the open air.

Goethe says of her: "She was one of those women who please us best out-of-doors. The loveliness of her manner harmonized with the flowery earth, the unclouded serenity of her face with the blue sky. A refreshing breath seemed ever to hover around her." After dwelling with rapture upon her grace, her beauty, and her goodness, he adds: "I knew no sorrow, no unrest in her presence. I was immeasurably happy when by her side."

The youth and the maiden were constant companions. They walked and rode, they read and sung, they talked and laughed together, and neither dreamed of any pleasure in which the other might not share. With the family and other friends, they took little jaunts into the country, went on excursions to the islands of the Rhine, and visited at the neighboring houses. Both, in their entire happiness, were the

gayest of the gay, and the life of every company; "but," says Goethe, "while we seemed to be living for those around us, we lived only for each other."

During absence they were still united in thought, and their letters were very frequent. In her correspondence Fredericka showed herself the same happy, unaffected child as in the intercourse of daily life. Goethe was already becoming known as a poet, and this young girl became the inspiration of his sweetest lays. He wrote many songs expressly for her, and set them to well-known melodies—"enough to fill a volume," he says, "had they been collected."

"My passion grew the more," he writes, "as I came to know the worth of the excellent girl, and the time approached when I must leave so much love and goodness, perhaps forever."

There had been no formal betrothal, and yet, in the sight of men and angels—by the election of their own hearts—these young lovers belonged to each other.

Goethe passed a highly-creditable examination, and received his degree as doctor of laws, an honor of which his father was not a little proud. The old gentleman had very high aspirations for his gifted son.

Before returning home to Frankfort young Doctor Goethe went to bid Fredericka adieu.

He writes: "Those were painful days, which I would gladly forget. As from on horseback I reached her my hand at parting, tears stood in her eyes, and I was also very sad at heart."

He had resolved upon leaving Strasbourg, to tear this passion for Fredericka from his heart, no matter how much agony it cost him. But this was no light task, for it was a love which had taken deep hold of all that was best and noblest in his nature. In absence, the image of the sweet young girl was ever before his eyes, and he pined incessantly for her. Had he followed the dictates of his heart, he would have returned to her to set the seal to their mutual affection by a formal betrothal. But worldly prudence with him was stronger than love, and he was a man who could yield up the sweetest dream of his life to ambition.

The disparity of station between the rich banker's son and the country clergyman's daughter was very great; it was an alliance to which the haughty old Frankfort aristocrat would never consent—yet still, in his inmost heart, Goethe knew that Fredericka was worthy of him.

The affection of the proud young student and man of the world had been put to a severe test when Fredericka and her sister, in their obsolete provincial costume, had come to visit some rich and fashionable Strasbourg relatives. Though Fredericka possessed a natural ease and grace of manner which made her at home in any society, still Goethe could not fail to note the contrast between his "woodland nymph" and the circle of high-bred ladies in which he moved.

Morbidly sensitive to the opinion of others, he could not endure to have his chosen one the object of invidious remark or criticism, and it was a positive relief to him when Fredericka returned home. Yet he very well knew that she would have the tact and good sense to adapt her dress and manner to the circles in which she would be introduced as his wife, and it is not probable that it was her inferior station or unacquaintance with high life, nor, indeed, fear of his father's displeasure, that induced him to break off the connection. He dreaded marriage as the grave of ambition, the frustration of a high career.

Soon after his arrival home he wrote the young girl a letter, bidding her adieu forever.

He says: "Fredericka's answer tore my heart. I now, for the first time, became aware of her bereavement, and saw no possibility of alleviating it. She was ever in my thoughts. I felt that she was wanting to me, and, worst of all, I could not forgive myself. I had wounded to the very depths one of the most beautiful and tender of hearts, and that period of repentance, bereft of the love which had supported me, was agonizing, intolerable. But man will live, and hence I took sincere interest in others, seeking to disentangle their embarrassments, and to unite those about to part, that they might not feel what I felt. Hence I got the name of the *confidant*. On account of my wanderings, I was also called the wanderer. I turned more than ever to the open world and Nature, and there alone I found comfort. During my walks I improvised hymns and dithyrambs. One of these, 'The Wanderer's Sturm-Lied,' yet remains. The burden of the song is, that a man of genius must walk resolutely through the storms of life."

No word of blame ever escaped Fredericka's lips, though Goethe himself says that his desertion nearly cost her her life.

Retired from the world, in the sweet solitude of her country-home, she passed a life beautiful in its unselfish devotion to others. While he to whom she had given her heart's first and only love stood upon the dizzy heights of fortune, splendor, and renown, she was the benefactor of the poor, the consoler of the sorrowing, the friend of all who were desolate and oppressed.

There were depths in her character, of which those who knew her only in her careless, happy young girlhood, little dreamed. She possessed a refined, sensitive nature; a tender, loving, womanly heart, which was worthy of a better fate. She was sought by others in marriage, among whom was Goethe's friend Lenz; but she declined all offers, saying, "The heart that has loved Goethe can belong to no other."

Eight years after their parting Goethe again went to visit the family once so dear, and the old scenes where the happiest moments of his life had passed. He was received cordially by all, even by Fredericka, who, he says, did not make the slightest effort to rekindle within him the old flame.

On the 5th of April, 1815, Fredericka Brion died in the little village of Sesenheim, which had been her home for many years. Her life had been tranquil, and her end was peace. The elder people of the village still remember and speak lovingly of the "good Aunt Fredericka," whose many virtues and acts of unobtrusive charity had endeared her alike to young and old.

She was laid to rest in the village church-yard, and, in accordance with her dying request, the only memorial above her grave was a simple black cross, placed there by the hands of those who had loved her. But the German youth, enraptured with the "Wahrheit und Dichtung" of their greatest poet, longed to behold the scene of the sweetest idyl of his life—to visit the spot where slumbered all earth could hold of her who had once loved Goethe so fondly—had been so fondly loved by him. And so the little black cross became the prey of relic-hunters, and for many years Fredericka Brion slept without any memorial save that recorded in loving hearts.

A few years ago the Rhenish poet, Hugo Oelbermann, and his friend, Frederick Gessler, visited the spot, and, through the *Gartenlaube*, the most widely circulated of German periodicals, solicited subscriptions for a monument to her who had been the first, best love of their great poet. The call met with a liberal and hearty response, and, on the 19th of August, 1866, the monument, a master-work of Honberg, was unveiled in the presence of a large assemblage.

The monument is simple yet noble, and, from a gold background near its summit, stands out in fine relief the bust of Fredericka. The features of the lovely face, perhaps somewhat idealized, glow almost with the light of transfiguration, and we marvel not that she was the first, perhaps the one true love of the great poet's life.

Beneath the bust is this inscription:

"SACRED TO THE MEMORY OF
FREDERICKA BRION.

A beam of the poet-sun fell upon her so richly as to lend her immortality."

To the oft-repeated questions, "Why was Goethe so faithless to himself and her? Why did he not marry Fredericka?" the most fitting answer may be found in the words he puts into the mouth of one of his characters:

"Marry? What, marry just at the time when life opens to you! To coop yourself up at home before you have gone over half your wanderings, or accomplished half your conquests! That you love the girl is natural; that you promised her marriage is the act of a madman."

"There is more truth than poetry in these words," coolly remarks one of Goethe's apologists. "It is, at any rate, by no means evident to me that infidelity to his genius would not have been a greater crime than infidelity to his mistress!"

Says another: "Marriage was a phantom from which he shrunk. Eros, with folded bow and broken wing, was to him an image of fear!"

But marriage with Fredericka Brion, the woman who loved and appreciated and gloried in him, would have been no infidelity to his genius, no frustration of his high career.

His biographer, Lewes, says: "He knew little, and that not until

late in life, of the subtle interweaving of habit with affection, which makes life saturated with love, and love itself become dignified through the serious aims of life. He knew little of the exquisite companionship of two souls striving in emulous spirit of loving rivalry to become better, teaching each other to soar! He knew little of this, Fredericka, and the life of sympathy he refused to share with thee is wanting to the greatness of his works."

Had he early in life married Fredericka, he would have been saved from many an idle flirtation, and from that hopeless passion for Charlotte Buff, the heroine of his "Sorrows of Werther," who, being engaged to another, was beyond his reach. "Had she been free," says one of his biographers, "he would, in all probability, have left her as he did Fredericka."

Had Fredericka been the guardian genius of his life, that brilliant, fascinating, intellectual, but unprincipled married woman of the world, the Baroness von Stein, would not for twelve years have exercised such influence over him; he would also have escaped that unlawful connection with Christiana Vulpius, a woman in every respect unworthy of him, which, after long years, ended in a marriage whose wretchedness he vainly tried to hide from the world.

The great poet and royal councillor, amid all his worldly fame and honor, knew nothing of the delights of a well-ordered, peaceful home, to which he could turn from the world's turmoil for rest and happiness; he had no congenial heart to share his joys and sorrows, to glory in his success. And so, without having ever harbored malice against him who had blighted her young life, Fredericka Brion was avenged.

For seventeen years she had been sleeping peacefully in the little church-yard at Sesenheim when Goethe's summons came. In 1832, full of years and honors, his mind undimmed, his natural force unabated, the great poet died.

He died tranquilly, painlessly, leaving a name linked to immortality through those great works which have left their impress on his own age, and will help to mould the thought of all the ages yet to come.

But the great poet, the transcendent genius, and the sweet, gentle woman, unknown save that her humble name is linked to his, are equals in the sight of God.

FRANCES A. SHAW.

A PICNIC AMONG THE ESTERELLES.

IT was on a fine, bright day, about the middle of December, that a number of carriages might have been seen drawn up before the *porte cochère* of a small but aristocratic hotel in the town of Cannes, in Provence, south of France. That something more than a common drive was intended seemed evident from the preparations which one saw on every side; shawls, cloaks, and great-coats, were bestowed away in the corners of the vehicles, while several good-sized baskets, which seemed heavy and well filled, betokened an ample supply of creature comforts for the inner man.

Presently the company began to issue, to the number of some five-and-twenty to thirty individuals of both sexes and varying ages; the carriages were speedily occupied, and orders were given to the coachmen to direct their course to a little way-side inn which stands on the highest part of the main road that leads from Nice to Marseilles, right through the Esterelle Mountains. This little inn was to be the stopping-place for the carriages, and the general rendezvous for the party, the first stage in the day's expedition, and from that point the rest of the excursion was to be carried out according to the taste and inclination of each individual member.

Here, perhaps, some one might be tempted to exclaim against the absurdity of a picnic in the middle of December, and that, too, in the midst of a mountainous district, and to say that such an idea is preposterous.

You would be quite right, dear madam, or honored sir, to make such an objection, were the scene of the excursion laid in this country, and in such a climate as ours; for at that period of the year there would very likely be several inches of snow on the ground, and the idea of an excursion then to a mountain's summit, and, much more, of a picnic there, would only be suggestive of red noses and frozen fingers and toes.

But pray remember that we are here on the shores of the Mediter-

anean, quite at the southern extremity of France, in a climate which permits the orange, the lemon, the date-palm, the cassia, etc., to flourish luxuriantly in the open air—where frost and snow are hardly seen or felt during the entire winter; where, though the air may often be chilly at night, it is always cheered and warmed during the day by the rays of a sun that is never obscured by fog; where one may see gentlemen and ladies bathing in the open sea until the end of December; where many residents of the place wear during the whole year the Panama hats, which in other countries are only used as a protection against the rays of the sun during two or three months of summer. Remember this, and you will no longer consider it an absurdity to talk of a picnic to the mountains in December.

On the day in question, the sky was almost cloudless; the air was clear and exhilarating, and every thing combined to favor the enjoyment of the party.

It was somewhat cosmopolitan in its composition, for many countries and nationalities had contributed their quota. The majority consisted of English ladies and gentlemen, who had come to pass the winter in Cannes; but there were Americans, from the United States as well as from Canada; there was a Scottish gentleman, with his wife, who had become a settler and property-holder in Australia; there was an Irish gentleman farmer from Tipperary; there was a young Spaniard; while the members of a charming Russian family, and two or three French officers from the garrison of the little neighboring town of Antibes, helped to complete the variety, as well as to augment the mirth and conviviality of the occasion.

The Esterelles are a spur of the chain which, branching off from the great range of the Alpes Maritimes, and passing at some distance behind the town of Grasse on the road to Dauphine, turn somewhat after that, and throw themselves, at a distance of some ten or twelve miles from Cannes, across the main road which, skirting the shores of the Mediterranean, leads from Italy to Toulon, Marseilles, and thence on to Paris—projecting their huge bulk into the sea to some considerable extent, like a gigantic bulwark, and serving a very useful purpose to the country to the eastward by shielding it from the dreaded mistral, or northwest wind, which prevails at certain periods, and is the curse of fair Provence. The city of Marseilles is particularly liable to it, and afflicted by it; for there it rages, at times, with a fury that is almost inconceivable, carrying persons along the streets in spite of their resistance, and overturning carriages, so that it is hardly safe, while it blows, to venture out.

The Esterelles, however, act as a very effectual barrier against this dreaded wind, and thus contribute to create for Cannes that sheltered position which has given it so great a reputation, and made it the resort of invalids and persons of delicate lungs from all quarters of the globe. They are, besides, very picturesque in appearance, and their varied and swelling forms and wooded slopes add much to the beauty of the landscape, from whichever side it may be viewed; while, during the winter, when the sun sets directly behind their summits, there is a constant succession of beautiful and varying effects, which must be seen to be properly appreciated, and are an endless delight to the artistic eye.

Mont Vinaigre is the highest point of the Esterelles, attaining an elevation of something less than three thousand feet above the level of the sea, and to climb this peak was in the programme of the party on the present occasion—that is to say, of all those whom age or weakness did not incapacitate from such rude exertion. The young members of the company were full of ardor, and impatient to arrive at the spot where the climbing was to commence; and the seniors, while amused at their expressions of eagerness and delight, could not help themselves being carried away to some extent, and becoming once more young as the youngest.

I have said that the main road from Nice to Marseilles passes directly through or over the Esterelles; indeed, the latter throw themselves so completely across the country that the road-makers had no alternative but to tunnel through, and this latter course has been adopted to a considerable extent by the engineers who carried through that part of the Paris, Lyons, and Marseilles Railroad which is continued on to Nice and the Italian frontier.

This main road was the one pursued upon the present occasion, skirting the shores of the Mediterranean until, after passing the little village of Agay, it quits the sea and begins to climb the hills which conduct to the highest ground.

Here, as the road began to wind upward, each turn would present

some new feature of picturesque beauty. From time to time, one would get a glimpse of the sea—sublime, that day, in its stillness, as upon other occasions in its fury; but there were so many other elements as to constitute a panorama of considerable extent, and infinite variety and beauty.

The shore, from the Esterelles, as it approaches Cannes, gradually slopes inward, forming a long and majestic but not very deep bay, which terminates, some four miles beyond that town, at the highland which forms the eastern extremity of the Gulf Juan, and on which stands a lofty light-house; and the whole of this long expanse, for a mile or two back from the sea, is studded with large hotels, and handsome or modest chateaux and villas, which have been for the most part erected within the last few years for the accommodation of the numerous visitors to Cannes, among which one sees the less pretentious habitations of the farmers and other inhabitants of the country amid a mass of many-colored foliage.

To the right, about a couple of miles from the main-land, is the group of islands called the Lerins, of which the largest—*St. Marguerite*—served many years as the prison of the famous *Man of the Iron Mask*, whose identity has given rise to so much discussion; while the next in size—*St. Honorat*—possesses a very curious old chateau, and is now occupied by some priests who have under their charge a school for the reformation of young men.

To the left, a little behind Cannes, on ascending ground, and almost buried under the foliage of the oranges, the lemons, and the olives, which surround it, one may see the little town of Cannet, whither the celebrated tragic actress *Rachel* came to reëstablish her health, and where she died. More to the north is Grasse, the chief town of the canton, the residence of the *sous-préfet*, and famous all the world over for its perfumery, the manufacture of which is the principal business of the place; while far away to the eastward loomed up dimly the giant outlines of the summits of the Alpes Maritimes, covered with perpetual snow, and forming a glorious background to the picture.

Add to all this the infinite variety in the foliage—for, although at that season the fig-trees are bare of leaves, it must be remembered that the oranges and lemons are in their glory, their fruit ripening about New-Year; and that the olive is an evergreen, whose grayish and rather sad-colored hue makes an agreeable contrast with the brighter greens of the former, while the trunks, twisted and often bizarre in their forms, produce a most picturesque effect in the landscape.

At this stage of the road many of the party descended from the vehicles, for the sake of easing the poor horses, who were toiling up the long and sometimes steep ascents; and at last, some on foot and some in carriages, all safely arrived at the little inn which had been designated for the rendezvous.

The building itself is one of the most modest pretensions, or, perhaps it would be more correct to say, without any pretensions at all; it is of some extent, but only part of it was occupied, as the doors and blinds of one end were fast closed. In former days, before any railroad had been constructed through the Esterelles, when diligences were passing several times every day, conveying the mails and passengers from Marseilles and Toulon to Nice, and when *chaises de poste* and private carriages were daily traversing the excellent road, which serves as the only means of communication with the world beyond the mountain, this inn had perhaps been a point of some importance, as it offered a convenient place to breathe the horses after the sharp ascent on either side; and, while the horses were resting, the masters and mistresses would often take some refreshment. But now, alas! its glory has departed. The days of diligences passed away with the opening of the railway, and the rich families who used to cross the mountains in *chaises de poste* now preferred the quicker and less troublesome route by rail, and were whirled through at the rate of twenty-five miles an hour, without a moment's thought of all they lost in forsaking the old and picturesque mountain-road.

Now, visitors were few and far between, and the decline was no less marked in quality than in quantity; for, instead of rich English *milords*, with their valets and couriers, or French marquises and counts, or Russian princes, scattering gold around in profusion, and never disputing the amount of a bill, however exorbitant it might be, now their principal customers were the few teamsters who still continued to transport certain kinds of merchandise across the mountains, in spite of the ruinous competition of the railway. Even these

were diminishing, as the older ones died or retired from the business, as there was not much to tempt new ones to enter the field. Occasionally, some well-to-do farmer from the environs of Cannes or Grasse on the one side, or Fréjus on the other, a lawyer or a notary, on his way to visit some client whose residence was in or near the mountains, would come along on horseback or in his little country-cart, and would stop to take his *petit verre* and have a chat with the people of the house; but such visitors did not do much to increase the prosperity of the way-side inn.

The sudden arrival, therefore, of so large a party of hungry guests might well have taxed the limited resources of the family into whose hands the administration of affairs had fallen on the present day, had no provision been otherwise made for the necessities of the occasion; but our host in Cannes, well knowing by previous experience how little dependence could be placed upon the larder and cellar of the little inn, had insisted upon our taking with us all that was necessary, both in solids and liquids, for an abundant lunch; and the large baskets to which allusion was made at the commencement of this article furnished, at the proper moment, a store of good things sufficient to rejoice the eyes and gladden the heart even of an epicure.

Our first care was to find a guide who could conduct us to the summit of Mont Vinaigre; nor was this a matter of any difficulty, for one of the officers from Antibes immediately undertook to procure a competent one, and returned, after an absence of a few minutes, during which we heard peals of merry laughter issuing from the kitchen, accompanied by a good-looking young woman of some twenty-two or twenty-three summers, whose bright, black eyes, and dark but ruddy cheeks, seemed to announce that the air of the Esterelles must be highly salubrious.

This we found was the younger daughter of the landlord of the inn, she and an elder sister assisting their father and forming the whole household. Both the daughters were acquainted with the path to the summit, and were accustomed to act as guides as occasion required; but the younger was the better-looking of the two, and she and the young lieutenant seemed on such good terms that I immediately suspected it was not the first time he had seen her, and that his alacrity in offering to procure us our guide was not quite so disinterested as I had at first supposed, but that the desire to have the company of the pretty Marguerite might have had some influence in quickening his zeal. Indeed, he half admitted as much when we taxed him with it, and informed us that he had made her acquaintance when his regiment, some time before, on arriving at Toulon from Rome, where they had formed a part of the French army of occupation, was on its way from the former port to Antibes. They marched across the Esterelles, and stopped a few hours, for their noonday-halt, at the plateau on which the inn stands, where the landlord and his two daughters had been most attentive to the wants of the officers. He was certainly not sorry for an opportunity of renewing the acquaintance, nor did it seem to us that the young girl listened without pleasure to the gay remarks and complimentary speeches of the gallant soldier. But has it not always been thus? From time immemorial, has not Mars been always welcome in the court of Venus?

Be that, however, as it may, it did not prevent Marguerite from a faithful performance of her duty on the present occasion; and she led the way, closely followed by the lieutenant, across walls and ditches, through brambles and brushwood, over loose stones and rocks, up steep and sometimes precipitous ascents, with a sure and steady foot, and at a rate which made it difficult sometimes for the most active to keep up with her.

For a good part of the way there seemed to be no regular and well-defined path, or, if there were one, she disdained to use it; she seemed to find her way by a sort of instinct which never failed her, and so we went on, blindly following her lead, in scattering files, until, after some two hours' steady and toilsome climbing, the peak which was the object of our excursion came in sight, but still at some distance.

It was marked by a large pile of stones—a sort of cairn—on the top of which had been secured a wooden cross, some six or seven feet in height; and, the moment this was distinguished, a general rush was made for the spot by all who were near enough to compete for the honor of arriving first at the summit.

It had been, for some time before, a neck-and-neck race between three of the party—an Englishman and an American, who were both small but active men, and the Tipperary farmer, who was fully six

feet high; and at this moment the American was leading, closely followed by the Irishman, while the Englishman made a good third. The Irishman was plying his long legs with a most praiseworthy activity; but the American was determined to win, and, as he had the lead, and the narrowness and steepness of the path made it a difficult thing to pass him, it seemed likely that he would gain the prize.

But who can withstand his fate? At the very last moment, when within some twenty feet of the cross, the son of Erin took advantage of a short cut at a turning which the American in his eagerness had overlooked, and, with a sort of Derby rush, and a few strides of his long legs, managed to head his opponent off, and to arrive first at the top.

Here every one was glad enough to sit or lie down on the stones around, to breathe a little, while feasting his eyes on the glorious panorama which opened out below on every side. It is true that in some respects the view was not so fine as that enjoyed from much lower ground, where the details were more perceptible, and the eye could rest with more pleasure on single objects; but the panorama was much more extensive, taking in a view of many points which were quite imperceptible from below. The city of Nice, some thirty miles and more distant, was plainly visible, with all the country behind and around. Grasse, with the mountain-range which bounds it, Cannes and Cannet, with their numerous villas and chateaux, were, of course, within easy range. On the west side of the mountain were discernible the bay of Fréjus and the hills which surround Hyères and Toulon, while all around the eye rested on a confused mass of mountain-peaks and hills, some covered with luxuriant foliage, while others were bare and rocky. The sea appeared perfectly calm, as far as could be judged from such an elevation, and the numerous craft whose white sails were dotting it in different directions looked like the little vessels that one sometimes sees on the miniature lake of a gentleman's park or pleasure-grounds.

We had hoped to be able to distinguish the snowy peaks of the mountains of Corsica, but were disappointed in this, as there were some clouds in that direction, and the position of the sun was such as to dazzle rather than aid the sight.

About twenty of our party had started from the inn for the purpose of scaling Mont Vinaigre; but there were only some seven or eight who persevered until the summit was reached. The others had dropped off from time to time, and were scattered here and there in the woods below, where we could hear their cries and vociferations.

After remaining on the top until we were well rested and our curiosity was fully gratified, we commenced our descent. Here every one shifted for himself or herself, and took whichever course his fancy suggested. Indeed, our guide was nowhere to be seen, and, as the young lieutenant had disappeared as well, we concluded he had found some occupation more attractive than that of gazing at the beauty of the panorama of Mont Vinaigre. However, this gave us no uneasiness. Taking the bearings of where our inn ought to be from the summit, we plunged boldly into the brushwood, and, sliding, jumping, sometimes falling, but always advancing, occasionally tearing our clothes with the brambles, and cutting our shoes among the sharp-pointed rocks, we all arrived at last in safety at the rendezvous appointed.

Here a sight awaited us, of a different nature, it is true, from that which had greeted us on the summit of Mont Vinaigre, but of a kind which had peculiar attractions to tired and hungry pedestrians. Those of our party who had not attempted the ascent of the mountain had made themselves useful by unpacking the baskets and arranging their varied contents in a manner which showed at the same time their experience in such matters and their thoughtful attention to the wants of their absent friends. With excellent taste, they had forsaken the dark and dingy rooms of the inn for the purer air of the outside. A long table had been laid under the spreading branches of an old oak which stood close to the door, and there, having borrowed of the host the necessary utensils for eating and drinking, they were awaiting our arrival with a feast worthy of Lucullus himself. At one end of the table stood a gigantic *pâté*, whose swelling sides announced a well-garnished interior; at the other end a noble-looking ham was doing *vis-à-vis*, and seemed to say, as plainly as possible, "Here I am, waiting to be eaten;" while down the two sides dishes of cold chickens, tongues, Bologna sausages, sardines in oil, and other niceties, gave evidence of the provident thoughtfulness of our Cannes host. Nor was there any want of something good to wash down such generous

food; for, ranged along the table like sentinels, was placed a number of bottles whose labels and seals were as familiar as "household words."

I need hardly say with what alacrity each guest took his place at the table, nor need I describe the rapidity with which solids and liquids disappeared under the vigorous attack then commenced. It was unanimously voted that the air of the Esterelles was eminently conducive to appetite, and that never had any thing tasted half so good as upon that occasion.

The stories told, the songs sung, the puns and jokes, were endless; and, though the company was composed of persons of widely-differing nationalities, they seemed quite united on that occasion in the determination to enjoy themselves to the utmost.

At length, some of the papas and mammas insisted that it was time to think of returning, and the merry party was obliged to adjourn to the carriages once more.

The drive home was accomplished without accident or adventure of any kind; but it was long before the remembrance was effaced, from any member of the party, of that pleasant "Picnic among the Esterelles."

FIRESIDES AND HEARTHSTONES.

IN the "Table-Talk" of APPLETONS' JOURNAL, I came of late upon the following sentence: "Firesides and hearthstones are things of the past, and with their departure have gone nearly all the best charms of a winter-home."

Though true generally of the *North*, this observation does not apply to the *South*, especially to the plantations and farmsteads of the interior, from the middle counties of Georgia and the Carolinas to the mountains of West Virginia and Tennessee.

Over that vast region, as a general rule, including the villages and smaller towns, the bright old fashion of ample chimney-breadths, open hearthstones, and blazing wood-fires, continues to prevail. Huge logs of oak and hickory are the staple fuel of the mountaineers, who, whether farmers or hunters, derive, we venture to say, more of cheer and comfort therefrom (though housed in the rudest cabin) than can be found in the most luxurious home, "over the hot air of a register, or by the burnt iron of a stove." It is, however, among the *middle districts* of the Southern States, and precisely in those localities which, to the casual observer, appear most lonely, impoverished, and repulsive, that Nature, as if in compensation for the barrenness of the soil, furnishes a species of fuel as royal in its abundance as it is beneficent in its health-giving and heat-producing qualities. We allude, of course, to the resinous light-wood logs, and the yet more valuable light-wood *knots*, which, charred by accidental fires that have decimated the forests into an outward hardness, will burn for hours with a steady, unintermittent glow, equally charming to the eye and comfortable to the invigorated blood. These light-wood *knots* piled among limbs of the dried gum-tree, as *pièces de résistance*, will produce a home-fire, of rare colored sparklings, but equable warmth, before which the daintiest *habitués* of a palace might rub their hands with a new sense of physical enjoyment, while to the hunter benighted by canebrakes, or on desolate uplands, such a fire is at once home, and wife, children, neighbors, and hearty social enjoyment.

"I've seed the times," said one of this class to us, "when I'd jist have stretched out like and died, but for them *knots*, black and nasty as they look a' top! Try a turkey-hunt among the 'Barrens,' and find yourself with nothin' for company but the sleet and rain comin' down like rips, and the sun sot for an hour an' more, and you'll know, onst for all, there's no friend so bully as the fat and resin inside a pine-knot! Lord! I've slept curled up like a coon, fast and comfortable, the blessed night through, with sich a downpour as never you beerd on, all by help of a thunderin' big knot a Noah's flood couldn't have put out!"

But, after all, the fires we have described appear to most advantage when roaring up some cottage chimney, and painting rude, ruddy arabesques along the roof and walls.

As December's twilight deepens, the farmer, let us say of the Georgia pine-barrens, or the remoter hill country, gathers his wife and children about him on a hearth of mammoth proportions, and, having added a back-log to the already well-furnished "dogs," and seen that

a caldron of bacon and collards is bubbling on the coals, takes his clay pipe, loaded with leaf-tobacco (the first whiff whereof would knock a Broadway dandy, as the printers say, "into pi"), and begins his evening's meditations in a spirit of sweet benevolence and goodwill toward all mankind.

Probably those meditations are not profound. They rest lovingly for an instant on the check, just received from his factor in Augusta, representing the sum for which his three bales of inferior cotton had been sold; ranging thence to the condition of the penned hogs fattening for Christmas, and the beautiful litter of pigs his favorite sow had borne him in the most opportune and obliging manner. Ten to one, a couple of these juvenile grunTERS may be whisking their black and white tails along the floor, and adding a note, scarcely harmonious, to the treble cries or laughter of the farmer's infants.

The "gude wife," in her corner, knits with placid perseverance, saying never a word, with a pipe between her lips, just two degrees smaller than her husband's, but stuffed with the same powerful tobacco; while the elder daughter labors cheerily at the loom, anxious to "turn out" some stuff of marvellous dyes that shall win for her the admiring envy of a score of bosom friends.

And mean time the flames crackle and glow, scintillate and sing many a homely ditty, suggestive to our farmer's thought of his days of courtship, long ago, and of the buxom lass—now a gray-haired matron opposite—who, in the light of just such a fire as the present, turned her blushing cheek to the wall as she plighted her simple troth. Anon, a sharp, steely glint in the flame may bring back to him the camp-fires of the Shenandoah and the Rappahannock, with memories of the lonely bivouac, the perilous picket-post, and the comrade whose dead face he scanned by a rude light like this.

It is to the solitary scholar, however, exiled from the keen life of cities, that the wood-fire, whether of pine knot or hickory, is indeed a beloved "familiar." It stands him in the stead of literary clubs, and *réunions*, of intellectual attrition of every conceivable description, of the superb acting of Booth, and the sweet singing of Nilsson, of a hundred enjoyments which to the least exacting of cockneys have become the bare necessities of existence.

The flames talk to him, whisper to him, and take him into their confidence, by signs and tokens known only to the initiated; they curl about his fancy with warm, loving caresses, lifting the burdens of weird ballads, and lingering, with a subtle trill upon long-forgotten melodies, about the polar regions of the heart, those realms which disappointments, wrong, deceit, have frozen over and made hard and sterile; they act with the soft, melting power of spring sunshine, and chill barrenness of sentiment gives place to the cordialities of benevolence and peace. Then how prolific are these flames in picturesque suggestion! From the moral to the fanciful they pass by a subtle legerdemain, building up for him great capitals his mortal eyes have never beheld, Paris and London, Rome and Constantinople, "Grand Cairo" and legion-crowned Damascus, or they reproduce, with yet more sudden transformation, all the ideal beings, "creatures of the elements," wherewith he is familiar, from the Pucks and Oberons of Shakespeare, to the grotesque monsters of Oriental story.

And so, finally, with both imagination and soul kindled and melted by turns, he is led, *summo gradu*, to the highest vantage-ground of wisdom, from which serene elevation the factitious and conventional are dwarfed to their true proportions, and stripped of their unreal charms.

Impecunious is the scholar; solitary, as we have hinted; perchance an exile; but out from the shimmering depths of his pine-knot fire emerges a fairy, spirit, half-embodied salamander—whatever thou wilt—who addresses him in the quaint language of old Robert Burton:

"Poor art thou?—why, the poorer thou art, the happier thou art! 'ditior est, at non melior,' saith Epictetus—he is richer, not better, than thou; not so free from envy, lust, ambition!

Beatus ille, qui procul negotiis,
Paterna rura bobus exerceat suis."

"Happy he who is freed from the tumults of the world, who seeks no honors, gapes after no preferments, flatters not, envies not, tempORIZES not, but lives privately, well contented with his estate!

"Nec spes corde avidas, nec curam pascit inanem,
Securus quod fata cadant."

"He is not troubled with state-matters, whether kingdoms thrive better by succession or election; whether monarchies should be mixed,

temperate or absolute; the house of Ottomans and Austria" (France or Germany!) "is all one to him. He is not touched with fears of invasion, factions, or emulations.

"In brief:

"A happy soul, and like to God Himself,
Whom not vain-glory macerates, or strife,
Or wicked joys of that proud swelling self—
But leads a still, poor, and contented life!"

Shall we not take these words to heart, and profit thereby? Surely the ghost of "Democritus Junior," that hath taken the trouble to leave its quiet tomb in the north aisle of Christ Church, Oxford, and to insinuate itself in the shape of an elementary spirit (though "*vox, et præterea nihil*") from out the embers of our wood-fire, deserves to be entreated with tender consideration.

Still, we are free to confess that, *without* the "fireside and hearthstone," poverty would prove wellnigh unendurable, and the above philosophical language would be to us but windy words. Before some narrow grate in an attic of the city, sparsely furnished with coal, hard as adamant, over which the thin blue flames curled viciously like shadowy fingers of malignant ghosts, we should hold "Democritus Junior," and "Democritus Senior," too, as mere hypocrites, emerged, "*e faucibus Erebi*," to deceive mankind!

Nor, sooth to say, can we imagine the richest denizen of the Fifth Avenue as open to fair impressions, philosophical or otherwise, with his "registers" and air-tight stoves, and a feverish, unnatural atmosphere of the tropics *within* doors, while the northeasters rave *without*, and a fragment of arctic sky seems to have slid somehow from the poles to freeze Manhattan into a huge iceberg!

In the banishment of the open fireplace, a severe if not fatal blow has been aimed at domestic concord, no less than domestic comfort. The *penates*, gods and guardians of household love, can exist but feebly, if the hearthstone be abolished.

Fancy those semi-divinities, in their honest simplicity of taste, brought into contact with the dull-red, steamy surfaces of your modern stove, and gasping the hot-house air, destructive to all natural things and creatures!

Where, in the absence of the frank-hearted flames, is a large family to assemble in the evenings, to exchange those charming confidences, which are the *soul* of household life and affection? The most luxurious apartment looks dull, deprived of the Ariel-artist of fire—that gay sprite who dances athwart the walls, paints the velvet cheek of beauty with a softer blush, moulds into gentler lines the care-worn face of manhood, and over the silvered hairs of age glimmers like a transient, but sacred aureole.

And what is the inevitable consequence?

ENNCI rules the hour and the place! Young men begin to view *such* "evenings at home" as a *bore*; young ladies, as a weariness to the spirit. *Paterfamilias* nods over his *Post*, and our lady-mother drearily dreams of the conquests of her first season, and involuntarily compares that awkward, heavy, white-whiskered millionaire by the table with the young Apollo to whom once she was disposed to give her virgin heart!

But the *children*, perhaps, suffer most from the fact "that firesides and hearthstones are" (in cities, at least) "things of the past." Instinctively a child delights in the shifting brightness of fire! The flames are his earliest toys, and he revels in the luminous wonder with an *abandon* of joy it is beautiful to see. Let us suppose, for example, it is a clear, cold Christmas-morning in the country. The cottager's family are assembled, shortly after sunrise, around his Brobdignagian chimney, furnished with a "yule-log," such as grows

"On Alleghanian ridges seen afar,
A monarch crowned with his imperial star,
Against the crimson where the sun hath set"—

and beneath it the indispensable "knots" crackle and flash like a salvo of Chinese fireworks; and the great, hearty flames roll upward with a rush and volume not to be resisted, while over those joyous faces, from the urchin of twelve to the tiniest ranks of the infantry, there is such a flush of health and irradiation of fine spirits, that the sight of it would melt, for a moment, even the malignant soul of a Quilp or a Grider! Those urchins are, one and all, firm believers in Santa Claus. Has not each his stocking, wherefrom an hour ago he drew—as from a veritable cornucopia—what to *him*, in his simplicity, is an ample fortune?

And now, amid the buzz of merry voices, the door opens, and the farmer himself appears, a huge silver tankard in hand (sole relic of

wealthier days), frothing over with egg-nog—rich and yellow as gold—the contents of which are distributed, in due proportion, to the members of the eager little circle.

Or if the tankard should be imprudently trusted to their hands, we shall mark it presently undergoing the fate of the enchanted drinking-cup, described in an ancient ballad:

"Some shed it on their shoulder,
Some shed it on their thigh,
And he that did not hit his *mouth*,
Was sure to hit his *eye*!"

Where, nowadays, in our large cities, can a picture like this present itself? Are not the city-children too often prematurely-wise little men and women, who scout the notion of Santa Claus, and scorn all the sweet, innocent superstitions of the past, affecting the ways and manners of their elders with a most questionable precocity? Alas! the abolition of "the fireside and hearthstone" is alone answerable for this melancholy condition of things! With no bright centre of domestic enjoyment and companionship, the ties of family are first loosened and then broken. People learn to depend upon outside excitement, to seek—according to sex—the billiard or the ballroom. The juvenile community is neglected by its proper teachers and protectors; in a word, the entire household becomes disjointed and disorganized; and finally, for aught we can tell, the "domesticities" will vanish altogether, and the idea of the "family" be ranked among the fossil conceptions of a long-forgotten age!

PAUL H. HAYNE.

BREAKFAST-FOOD FOR THOUGHT.

A S Owen Meredith sings—

"We may live without love—what is passion but pining?—
But where is the man that can live without dining?"

And who, be he ever so far removed from the gross and the sensual, has not, in some hour of his life, felt this truth? The poet does not merely iterate the fact that we must eat, in order to live; he implies, also, that we cannot be thoroughly happy, unless we *take pleasure* in dining. Many a man of worth besides him—if precedent is wanted—has not scrupled to throw his whole soul into his palate at the dinner-hour. Is it likely, for example, that Thackeray, who trifles with such delicate relish over even the "Reminiscences of a Gormandizer," sneered at the actual banquets which gave origin to those reminiscences? For myself, I revere that instinct of my nature which prompts me to enjoy my dinner. "Enough is as good as a feast," saith the old saw; and, howsoever delectable the healthy enjoyment of one's dinner may be, it is yet possible to carry it too far. Among our own people, for example, a tendency has arisen to inaugurate each day with a meal not uncleverly styled, by Sala, a "morning dinner." The nature and aim of dinner, however, are essentially different from those of breakfast; and it is the ignoring of this difference, and the consequent abortion of the matutinal repast, which form the gist and mainspring of the dissertation before the reader.

The feast of reason thus occasioned we will take, if you please, in three courses—the first treating of breakfast as it should be, the second of breakfasts as they are, and the third pointing the moral. "Aha!" exclaims the acute reader, "there is to be a moral!" Yes, my dear sir; let me metaphorically rub my hands in deprecation, and acknowledge that there *is* to be a moral. But, in truth, it is not my fault. There is a moral to every thing under the sun—many morals, but little morality. However, the railroad-crossing sign is known to all. The bell has rung: look out for—

But our first course is cooling, while I stand prosing behind my chair. Come, let us fall to!

To begin with, then, we will strike at the root of our subject by deriving the meaning of the word breakfast, and thence the law which shapes it to a healthful perfection. Summon the prisoner into the dock. Breakfast—is he dight?—a fine subject for examination, carrying his whole story in his face! Cross-questioning him by the insertion of a hyphen, you have him exposed. Break-fast! he stands convicted. But, to strengthen the evidence, we may as well call up yonder sturdy German Frühstück, who stands simply for "early morsel." Now, combining these two bits of easy information, we seem to evolve the true character of the day's first meal. Its aim, then, is

to break the long fast of the night; its limit is affixed by the word "morsel."

Such is the ideal breakfast. But let us take a cursory view of the actual forms of breakfast, as compared with this their common prototype.

In this we would seem naturally led first to the French, whose custom, in the world of fashion, is as law. The fitting hour for breakfasting was doubtless prompted, in primitive times, by the natural demand of an unperverted appetite, after a night of temperate and healthy sleep. Your Frenchman, however, has a disposition to replace various clumsy arrangements in the order of Nature with certain brilliant contrivances of his own—a tendency well illustrated in the case of the Parisian painter who retired disgusted from out-door study, declaring that *Nature did not manage her greens well*. With a contempt for Nature in no degree inferior to this, the artists of the *cuisine* have caused a *déjeuner à la fourchette* to supersede that superannuated absurdity, the natural breakfast. Their artifice is, as every one knows, thus contrived: A polite cup of coffee, on rising, staves off the rude and ill-bred importunities of hunger until noon, when, lo! a luncheon, most elastic in its proportions, embracing varied viands, pastries, and wine, concludes a dignified treaty with the beligerent. Beyond doubt, this is elegant and *de ton*; but it jars with our theory of breakfast, deduced from its name, and, by consequence, from the natural law which underlies it. The French breakfast is, however, a logical consequence of late hours, and in assailing it we attack the vital—or, rather, mortiferous—principle of *life à la mode*.

Next-door neighbors to these artful Gauls, the Germans are the most primitive of all in their division of eating. Their dinner remains, as its name implies, a "noonday-eating;" their supper, an "evening-bread." As for breakfast, it consists of coffee and bread, being sometimes embellished with an egg, or the delicacy of honey. This, then, is as yet the nearest approach to our ideal breakfast. Were we to search from Calpe unto Caucasus, perhaps we should find nothing more consonant with it.

Having tested its merits for some years, I embrace it as one of the regenerators of overeaten mankind. And, besides its healthful influence in general, this sobriety at the breakfast-hour tends to cultivate a refined and natural taste. Even so sensual a sense as that of the palate should be carefully developed in the perfect man—not enslaved to the products of any culinary school, but subordinated to the rational faculty. The German breakfast offers just enough to still the biting edge of appetite without surfeiting the taste, and can thus compress from one *bonne bouche* as much enjoyment as from the richest banquet spread before Luxury and Satiety.

Crossing the Channel (hastily, for it is a region utterly subversive of reflections on the matter in hand), we enter Albion on our quest with sharp sea-appetite. Take this seat on the other side of the table, and we will try an English breakfast together. "Breakfast!" you exclaim. Ah! you hardly recognize the meal as belonging to that species. And you are right; for an air of solid comfort enfolds Britannia's breakfast-board, which makes one feel as if he fed on twice as much as is the fact. There steams, with solemn murmur, the massy tea-urn; there, in the centre, looms the mystic circular dish without which no well-regulated table is spread in England—the tripod throne of English muffins—fed from beneath with flame which the butler, as officiating seer, dresses with reverent care. A tasteful platter of some light meat graces the feast—usually a little row of chops, that once frolicked on the famed South Downs. Moreover, as a connecting link are introduced knotted loaves of robust British bread, and prim files of inevitable toast in little silver stands. "A tolerably-substantial morsel," remarks the pensive peruser of these notes. It does seem, indeed, to lend our ideal an all-too-palpable embodiment. But, after all, the Briton does not break his fast heavily. He eats substantially, but briefly; and, besides, the climate in which he lives must also be considered. It is heavy and oppressive, and seems to demand stout fare. But, whatever be the physical cause, our cousins seem to thrive on this *régime*, and result is the best monitor of practice.

But we think otherwise. Or, do we think at all? or, if at all, enough? Our forefathers, who had Plymouth Rock to reach, and forests primeval to cultivate, had also good reason to develop a breakfast of the most substantial kind. So have our tillers of the soil, to-day. But we, who inhabit cities, and do not occupy ourselves with the appetizing employment of drowning witches and whipping culprits,

have nevertheless imported into our metropolitan life the breakfasts of the farm and the frontier. The farmer or manual laborer scarcely eats as heartily as the city merchant or the lawyer. Men of these latter occupations, breathing the feeble air of streets—strong only in one sense—seldom exercising in their daily round more than the brain and the fingers, require as robust a nourishment as the working-man who is developing the body in many directions at once! And not only in theory, but in fact, is this illogical relation of things disastrous. For the merchant and the lawyer, overworking their stomachs, reduce their whole physical machinery to dangerous weakness. The brain, however, is subject to an unremitting demand, and this protracted intellectual strain on enfeebled physiques insures unsatisfactory lives, if not premature deaths.

Let me not be suspected of too great zeal in assigning such dire effects to a cause apparently so trivial. Jerrold says, with much truth, that "troubles are like babies, and grow with nursing." In no case is this so well exemplified as in that of the pseudo-reformer, brooding over his pet evil. It may be that your humble servant is a living monument of this wholesome truth. Yet I admit that the ills I have depicted, and the equivocal glory of being a nation of dyspeptics, owe their origin to more than this one source. But it is foreign to the contents of this paper to discuss other than this. The representative American, though he be a temperance-man, is intemperate in the consumption of ice-cold water, and, if not of ice-water, he is accustomed to brace his appetite before breakfast with some drink guiltless of the crystal fluid, and, after breakfast, to unbrace it, as a useless thing that has served its turn, by a succession of similar beverages, until it reaches such an ebb that it must be again braced for the next-succeeding meal. Whether these customs appertain to breakfast, I leave to the inference of the individual reader.

In a great measure, however, the national stomach and digestive organ could be relieved by our assimilation of the German breakfast. The experiment in little, at least, has saved the digestion of one American, and could be extended to a like work of salvation for all others.

The light instalment of food which it allows leaves the stomach placid and the brain clear; hunger has been appeased without being crushed by sheer weight of rich or heavy comestibles. This is, of course, in accordance with the true principle of breakfast. Morning is the fitting time for work, when the brain brings its accumulated force from the refreshment of sleep to the day's task. To clog it, then, by overstraining the digestion, is a fault of economy unworthy the labor-saving spirit of our age.

There arises, also, a question of the morality of such over-indulgence before working-hours, which might easily be expanded to another chapter. Self-indulgence in general is the bane of our national life. It enfeebles each generation in turn more and more, lowering the moral and mental standard of our youth. The end of this is not difficult to foretell—"he who runs may read."

The habit of light breakfasting brings another improvement in its train, entailing, as it must, an early dinner; and thus we are a second time rescued from undigested woe, by one timely though difficult self-denying precaution. When the brunt of the day's business is over, one can afford to relax a little; one can enjoy without harm a little indulgence, and warm the heart with a savory dinner and a glass of wine.

But, in introducing this breakfast *au naturel*, I am well aware that I have not to do with the black-broth Spartans of old, and that I broach the abrogation of many delicate attractions and soft ravishments of the morning-meal, which will not be resigned without a murmur. Yon dusky wealth of baked potatoes fades from the vista of the future breakfast, shrouded in a sheet of its own wreathing steam. No more the swift relays of buckwheat-cakes shall "chase the glowing hours with flying feet." The banquet shrinks from courses of fish and viand and varied legumes to the frugality of the Teuton. A multitude, in short, of indigenous and indigestible dishes will die with the custom which produced them, and become "portions and parcels of the dreadful past." That branch of culinary art, indeed, devoted to the composition of breakfast-pieces, will languish and disappear. Against regrets based on these irretrievable losses, I can avail nothing; their objections root in the heart—mine but spring from the unsympathetic intellect. But to those who have essayed the change, or shall hereafter, persuasion were superfluous.

GEORGE P. LATHROP.

TABLE-TALK.

AN attempt is often made to draw a distinction between politicians and statesmen. No difference exists between the original meaning of those words, and very little difference, we apprehend, can be discovered between men arbitrarily classified under them. "A politician," says a recent writer on this subject, "is a man who thinks of the next election, while the statesman thinks of the next generation." If this is true, then a statesman is a Mrs. Jellyby in trousers, and the sooner he withdraws his regards from such remote object of his care, the better for us and our descendants. The next generation will be born of this generation. Its prosperity and general well-being will be the natural products of the prosperity and general well-being of the generation that preceded it. This fact may relieve all our Mrs. Jellyby statesmen of any particular care for the future. Whatever good for the country they may be able to promote now, will be sure to bear ample fruit for the good of the country hereafter, and let this content them. The writer from whom we have quoted can name but very few public men, past or present, who have not been concerned in the triumph of their party, or who have been identified with any real advance in the principles of government. Politicians and statesmen ("handy-dandy, change places, which is the statesman? which the politician?") have often a profound knowledge of the administration of affairs; but absolute principles are conceived and set forth by quite another class of men. Adam Smith, in his closet, worked out the laws of the "Wealth of Nations," and the fundamental principles there laid down not only were never conceived by either politician or statesman, but to this day remain most imperfectly understood by public men the world over. Buckle goes so far as to tell us that legislation—and legislation has been sometimes in the hands of men who may be called statesmen—has never accomplished any good whatever, excepting the negative good of undoing the evil this year it wrought last year. The history of government is the history of blunders, mistakes, and ignorance. To regulate a thousand things that should not be regulated, to ceaselessly set up principles that philosophers (not statesmen) have discovered to be radically false, has been the history of statesmanship pretty nearly from the beginning. Almost, for instance, up to the present hour statesmen have acted upon the idea that to impoverish neighboring nations was to enrich their own. Within five years we've seen a whole Congress attempt such an infatuated thing as the regulation of the price of a commodity like gold. True statesmanship, we imagine, is very little more than a negation. The larger the range of matters from which it withholds its regulating hand, the better usually will it perform its functions. To maintain peace, to preserve order, to establish justice, are its primary duties. Government, it is true, does go a little further; but whatever is attempted beyond these simple principles should be undertaken cautiously. An organized public education may be within its mission; and whatever it does in promoting the

ends of art, science, or education, even if there is a stretch of its power, is likely to do good, and cannot easily do harm. But the importance of this high-sounding statesmanship is very much overrated. The world has managed to get along tolerably well in despite of its blunders, and this is pretty much all that can be said in its favor. Let the history of civilization bear witness to the truth of what we say. Wise rulers can always do good by preventing foolish legislation, and this is about all that statesmen can do more than your politicians.

— Mr. J. Hain Friswell has just published, in London, a work he modestly entitles "Modern Men of Letters honestly Criticised." This assumption that his criticism possesses a character distinctive from that usually offered the public might, well awaken suspicion; and our readers will not be surprised to learn that these "honest criticisms" are for the most part marked by savage hostility. Mr. Tennyson, for instance, "has been a very discreet and a very good court poet, for a manufactured article none better." Anthony Trollope's will not live; "no one can care for the faint and obscure outlines and the colorless sort of wool with which Mr. Trollope weaves his human and his faded tapestry." But Mr. Friswell is not only "honest" in criticism, he is very piquant in his personalities. Of Tennyson he says: "Look at his photograph. Deep-browed, but not deep-lined; bald, but not gray; with a dark disappointment and little hopeful feeling on his face; with hair unkempt, heaped up in the carriage of his shoulders, and with his figure covered with a tragic cloak, the Laureate is portrayed, gloomily peering from two ineffective and not very lustrous eyes, a man of sixty, looking more like a worn and a more feeling man of fifty. His skin is sallow, his whole physique not jovial nor red, like Shakespeare and Dickens, but lachrymose and saturnine." Of Disraeli we learn that "you can see him near Grosvenor gate walking in the sunshine, an old man who looks older than he is, bent down, with his hands behind his back, thoughtful, sallow, his face lined with care. You can see him, too, after a triumph in the House, youthful almost, very good-natured, genial and wise-looking with a tender face, and a statesman-like look, a worthy chief to follow." Bulwer is served up with the most highly seasoned "honesty" that could be wished. We are not only told of his "thrice-damnable highwaymen stories," but regaled with the following piquant description of Lord Lytton's personality: "Walking, let us say, up the hall of the Freemasons, at a Literary Fund Dinner, there is a gentleman, rather feeble, doddering, a Cousin Fenix, with tumbled hair, a face rouged, flushed, a noble forehead and high aristocratic nose, a gentleman unmistakably, a gentleman with the 'true nobleman look' that you do not find one man in a thousand has, and of which Pope spoke. He is not very strong this gentleman, and has a scared kind of stare—that, indeed, of a student out in the world. In this living face, and in photographs from it, there is a suspicion that it is 'got up' to what its owner thinks its best; that Pellam would be younger than he is. Vain struggle with Time; what gentle

wagoner can put a 'skid' on his wheel when he is going down hill, or 'with a finger stay Ixion's wheel,' as Kents has it? Look at the hair brushed forward and manipulated, the eyebrows, whiskers, and hair somewhat darkened, the mustache and imperial! The whole look of the man has just the clever *artistry*—not insincerity, for Lord Lytton is a true man—which is the little bit of bad taste which has prevented its master from being the very first in his rank." Of Mr. Swinburne we are told that he "has a young, unripe, and not very healthy look," supplied with "that pallor which accompanies red hair"—that "his chief and most high works are but mocking songs of the atheist that erst might have been sung in Sodom, and lascivious hymns to Adonis that might fitly have been howled in Gomorrah."

— It is often surprising with what persistence the burnt child will return to the fire. As many times as critics and theatre-goers have experienced the incoherent absurdities of what is called "American comedy," we still find them returning with patience and ever-recurring hope to each new dramatic attempt of this character. It was almost certain before the curtain went up on the new comedy of "Saratoga," at Mr. Daly's theatre, what sort of extravagant nonsense would be served up as comedy, and yet there were many hopeful people gathered at the theatre, on its first representation, with the vague hope that something was at last to be done in the way of true American comedy. But the title of the play ought to have been a sufficient warning. Who writes of Saratoga, or Long Branch, or Newport, without at once assuming that the manners of that place are fast; that slang, pretension, vulgarity, parvenuism, intrigue, and imbecility, are the sole characteristics of American pleasure-seekers? And what comedy-writer of the slightest originality would venture upon the old, wearisome, and long-since detestable ground? One experienced in American comedies had only to read the play-bill of "Saratoga" to forecast the whole performance. How remarkable it is that men can essay to write comedies without apparently the slightest knowledge of what comedy means! A comedy, according to traditional notions, is a picture of manners and a reflex of society. But a comedy, according to the ideas of American dramatists, is a burlesque of manners and a *mélange* of farcical incident. That a comedy as a work of art should have a sane and coherent story, and humorous, of course, but probable and pertinent incidents, seems never to enter the ideal of our native stage-writers. That it should contain real people, and not purely eccentric inventions, and, while justly attempting the satire of social follies, should depict and not imagine the objects of its wit, are also theories that are entertained apparently by everybody but dramatists. "Saratoga" has the merit of not being dull. Its succession of absurd and impossible incidents serve to amuse indiscriminating audiences, and so the manager's purpose is in one way answered. But, in the name of art, do let the man who next attempts to write an American play have some sort of conception of his task. Don't let him imagine that a jumble of incidents, a

collection of men and women, and a profusion of slang, make a comedy.

— Pertinent to this matter of American comedy, arises the question, whether satire, if a legitimate, is the best expression of dramatic art. "Shooting folly as it flies" has at all times been the occupation of the dramatists, but we imagine that ordinarily the effect of this is to make us like the sport rather than hate the game. The manners of a people are more likely to be improved by good than by quizzical examples. Are not such comedies as the recent English ones very much better teachers than even such wit and satire as Sheridan's? Gossip, we imagine, flourished none the less abundantly because of "The School for Scandal." We are apt, in satirical comedy, to be a good deal more amused in seeing how our neighbor is hit than in taking the lesson home to ourselves. Both in the theatre and the church we are prone to industriously hand over the application of every censure to somebody else, and to wonder why other people do not reform under such excellent admonitions. But pleasing examples of virtue reach the heart subtly, almost unconsciously, and insensibly, perhaps, but really prompt the nature to better things by enlisting its sympathies on the right side. Good manners and good taste are contagious, and so are good sentiments. The virtues that were dramatically spouted at the spectator in the old-fashioned sentimental comedies became almost detestable. But the fine social qualities that are quietly depicted in the realistic and yet tasteful comedies of the new English school exalt and refine the spectator. The pleasing pictures of life in these comedies; their delightful home interiors; their agreeable men and women; their tone of good breeding; all these give to them not only a supreme charm, but a moral mission. Instead of American comedy-writers ceaselessly holding up for the example of our young people pictures of fast girls, with slang upon their lips, rouge upon their cheeks, and boldness in their faces and manner, why not try the delineation of some pure and true types of American womanhood? Let our dramatists select for once the best and most agreeable phases of our native life for dramatic delineation. This need not exclude wit nor piquancy; it would require a little invention perhaps, and a little art, and a little knowledge; but, if the dramatist has not these things, let him stop writing altogether. The artistic presentation of our happier domestic life would excite surprise, for it is quite unknown to the drama, awaken not a few pleasurable emotions in the hearts of those who believe that culture, and dignity, and "simple faith," are as often found in American life as elsewhere, and, in supplying right examples of life and character, serve to elevate the public taste.

Literary Notes.

A NEW European Guide-book has just been issued by D. Appleton & Co., which is comprehensive, compact, and as accurate as the utmost care could make it. It is a guide to England, Scotland, and Ireland, France, Belgium, Holland, Northern and Southern Ger-

many, Switzerland, Italy, Spain, Portugal, Russia, Denmark, Norway, and Sweden. It contains a map of Europe, and nine other maps, with plans of twenty of the principal cities, and one hundred and twenty engravings. "In the preparation of this guide-book," says the preface, "the author has sought to give, within the limits of a single portable volume, all the information necessary to enable the tourist to find his way, without difficulty, from place to place, and to see the objects best worth seeing, throughout such parts of Europe as are generally visited by American and English travellers. With few exceptions, the author has travelled over the routes he has described, and has given the results of his own *bona-fide* researches."

A new Russian periodical was announced for publication on the 1st of January (Russian style), 1871, at St. Petersburg, its contributors to be principally women. Its title is, "An Illustrated Edition of Translations of the best Foreign Authors," and the first part was to contain versions of Mr. Smiles's "Biography of Working Men," by S. Vicolozerski; of Palgrave's "Travels in Arabia," by Anna Budkiewicz; two of the Erckmann-Chatrian tales, by Vera Erakoff; and "On London Labor and London Poor," by the editress, under the name of M. Vavciok.

"The Victory of the Vanquished, a Story of the First Century," is the title of a new novel, by the author of the "Schönberg-Cotta Family." As the title implies, this story is of the primitive Christians—a field calculated to tax the best skill of a novelist; but the genius that succeeded so well in the delineation of the period of Luther could with safety venture in this more remote but perhaps not more difficult epoch. Dodd & Mead are the American publishers.

A useful little manual is "What to Read, and How to Read," a classified list of books in each department of study, with hints and suggestions to the reader. The lists are divided into first class, second class, and third class, which arrangement enables the reader to take up first the most important in any series, and continue at his option with the subsidiary volumes. D. Appleton & Co., publishers.

At a recent meeting of the Philological Society, lately formed at Oxford, says the London *Athenæum*, a proposal was brought forward to introduce into the university the Continental pronunciation of Latin, which has already been adopted at several of our public schools. The proposal, which was supported by the professor of Latin and the rector of Lincoln, was referred to a committee for consideration.

The year 1871 is the centenary of Sir Walter Scott's birth. This fact has induced the London *Athenæum* to print a criticism of his writings, their character, and present influence. No doubt, many similar papers will appear, and the interest in the Waverley novels and the poems be greatly freshened.

Lippincott's Biographical and Mythological Dictionary, publishing in numbers, has reached its twenty-second part, which nearly completes the first half. This is a very complete and excellent work. The publishers are pushing it forward rapidly, in order to insure its completion as soon as possible.

At John Murray's recent annual sale, two thousand copies of Darwin's new work, "The Descent of Man," were disposed of in advance of publication. This work will shortly be issued here by D. Appleton & Co.

D. Appleton & Co. are about issuing a new edition of "The Heir of Redclyffe," and other novels by Miss Yonge, in uniform style, and with new illustrations.

The autobiography of the late Lord Brougham will appear from the press of Blackwood & Son, early in the year.

War Notes.

The Siege of Paris.

OUR Paris correspondent sends us by balloon post, date of December 24, further particulars of the progress of the siege up to that day:

From the 25th to the 29th of November the line of forts from Mont Valerian to Charenton kept up a regular fire upon the German positions round the south of Paris, the efforts of attack and defence being gradually concentrated at that point.

The wide fosse, four miles in length, connecting the forts of Briche and Double Couronne, between the Canal St.-Denis and the Seine, was last week filled with water, the quantity lifted by the five steam-engines from the Seine having been no less than twenty millions of gallons. This operation is reckoned to be one of the most interesting works of the defence of Paris. The manufacture of cannons, mitrailleuses, rifles, projectiles, and ammunition, is carried on with the most prodigious activity; thanks to those efforts, the three armies of Paris, now fully armed and equipped, supported by formidable trains of artillery, have been able to resume the offensive. This new phase of the siege of Paris began on Sunday last, the 27th of November, when all the gates around Paris were closed upon the non-combatants, egress and ingress being limited to those engaged in the defence of the city. During the whole of the 28th of November, masses of French troops, numbering more than three hundred thousand men, supported by seven hundred pieces of field-artillery, two-thirds of which were of heavy calibre, were divided into three corps and concentrated—first, between Vincennes and Saint-Maur, under General Ducrot; second, between the Porte d'Orleans and the redoubt of Villejuif, under General Vinoy; and third, in the peninsula of Gennevilliers, under General Trochu, the commander-in-chief. On that morning the proclamation of the members of the provisional government informed the inhabitants that the effort demanded by the honor and safety of France is being made, and that their military chiefs at the head of their brave armies had gone forth to dislodge the enemy from his entrenched lines, and join hands with their brethren of the provinces. General Trochu, in his address to his soldiers, says: "After so much bloodshed, more must flow, the responsibility of which rests with those whose detestable ambition tramples under foot the laws of justice and modern civilization. Let us put our trust in God, and march forward in defence of our fatherland." General Ducrot, in his stirring address to his soldiers, appeals to their honor and patriotism to make a great effort for the liberty, integrity, and independence of France, and reminds them of their wasted fields, their ruined homes, their sisters, wives, and mothers, desolate. Expressing his determination to reënter Paris either dead or victorious, he ends his address with the words "Forward then, forward, and may God protect us!" The troops, electrified by the words and example of their chiefs, went forth hopefully to do battle for their country.

On the morning of the 29th, the gunners in the peninsula of Gennevilliers, bombarded the positions held by the Germans, near Orgenteuil and Bezons. On the fire ceasing, the French troops occupied the island of Marante and the Pont-aux-Anglais, where they are now strongly intrenched. A strong column of troops from the peninsula made a reconnoissance in force in the neighborhood of Buzanval and Bois-preau. The corps commanded by General Vinoy, at the south of Paris, at the same time opened a heavy cannonade upon the positions of Chevelly, Hay, and Choisy-le-Roi, and afterward carried by assault the intrenched positions of Hay and the cattle-station of Choisy. Those positions, however, had to be abandoned, being commanded by the German batteries on the hill of Chatillon. As the German reserves hurried forward to defend their positions, they were constantly exposed to the fire of the gunboats of Captain Thouassat, near the Port à l'Anglais, the pieces of heavy artillery, mounted on iron-clad locomotives, near the batteries of Ivry, the redoubt of the Moulin Saquet, and the fort of Charenton, and must have sustained serious losses. The French losses on the 29th were estimated at about six hundred. Early, on the morning of the 30th of November, General Ducrot, at the head of his army, crossed the Marne on pontoons, attacked the intrenched position held by the Germans on the plateau of Chennevières, whom they dislodged after a desperate struggle of six hours' duration. They likewise succeeded in taking possession of the plateau between Brie-sur-Marne and Champigny, and remained masters of the conquered positions. The brigade led by the vice-admiral, commanding the fort of St.-Denis, dislodged the Germans from the villages of Drancy and Groslay; while the brigade of Henrion carried by assault the intrenched village of Epinay, and captured seventy-two prisoners and two cannons of the new model. The strong position of Montmesly was taken, but had to be abandoned on the arrival of heavy German reinforcements. This complicated series of combats, engaged on so many different points, lasting from six in the morning until five at night, was, upon the whole, highly favorable to the French arms. The terrific cannonade, that scarcely ever ceased a moment during the whole day, kept the people of Paris in a state of feverish excitement; on learning from the official report the successful nature of the day's operations, their enthusiasm was indescribable. The French losses are heavy, but have not yet been ascertained, General Renault and General Ladreit de la Charrière being severely wounded, and many distinguished officers having fallen. The steamboats of the Seine were engaged the whole day and night in transporting the wounded from the battle-field to the Quay of the Jardin des Plantes. Long files of ambulance-vans received the poor victims of the horrid cruelties of war, and distributed them throughout the different quarters of the city. Hundreds, preferring to be taken home, were carried through the streets on stretchers, their pale faces and their bandaged and bleeding forms exciting boundless sympathy and commiseration.

In the midst of their cares and grave responsibilities, the members of the government have formed an improved system of national education, and projected the opening of free lecture-rooms and circulating libraries in all the arrondissements of Paris, for the mental and moral improvement of the working-classes.

Historic Echoes.

There is a remarkable resemblance in some points between the history of the present campaign of the Prussians in France and that of

the French in Prussia in 1806. Indeed, the records of that period might, with a change of names, be almost taken for stray pages of the war-literature of 1870. After the battle of Auerstadt, which was lost by the Prussians chiefly owing to the mismanagement of their generals, and the surrender of Erfurt and Napoleon's entry of Berlin, occurred the capitulation of Prince Hohenlohe and his army, then the retreat of Blücher to Lübeck, the storming of that city, and the surrender of Blücher with the wreck of the forces under his command. After this the Prussian fortresses fell an easy prey to the French, and then, with more reason than now, it was said that these fortresses might have held out for some time longer. When Spandau capitulated on the 24th of October the French observed that, well defended, it might have sustained a siege of two months after the trenches had been opened. Stettin surrendered on the 29th of October, capitulating to the first column of French troops which appeared before it, who found to their surprise that it contained a garrison of six thousand fine-looking troops, one hundred and sixty pieces of cannon, and abundant magazines of all sorts. Custrin, a place of considerable strength, and of great importance on account of its situation upon the Oder, surrendered to Marshal Davoust on the 1st of November, as soon as it was invested and summoned, though its garrison consisted of four thousand men, amply provided with magazines. Magdeburg, the bulwark of the Prussian monarchy on its western frontier, capitulated to Marshal Ney on the 6th of November, after a few bombs had been thrown into the city; and Hameln, the chief fortress of the electorate of Hanover, had not even that excuse for its surrender on the 20th of the same month. In Magdeburg were found twenty-two thousand troops, including two thousand artillerymen, and in Hameln there was a Prussian garrison of nine thousand men, with six months' provisions and stores, and ammunition of every kind. The French general to whom the place was given up had no forces with him except two Dutch regiments and a single regiment of light infantry. In the mean time another inferior army assembled at Wesel, under the command of Louis Bonaparte, the newly-created King of Holland, overran the Prussian provinces of Westphalia, and penetrated into the electorate of Hanover; and a still smaller corps, under General Dandels, took possession of Emden and East Friesland. At Münster and other places valuable magazines fell into the hands of the invaders, and no resistance was anywhere made to them. Hameln, as before stated, was given up to General Savary, and Nienburg, the last place of the electorate held by the Prussians, capitulated a few days afterward (viz., on the 25th of November). The surrender of Plassenberg, a small fortress in the territory of Bayreuth, completed the conquest of the Prussian fortresses in Germany to the west of the Oder.

Then, as now, there was, for a few days, some hopes of an armistice. After the battle of Auerstadt, Lucchesini was dispatched by the King of Prussia to the French headquarters to negotiate peace, and, on arriving there, on the 22d of October, Duroc was named by the French emperor to negotiate with him. At first the Prussian minister was amused with hopes of concluding a peace on the terms which he was authorized to offer; but, as the situation of his sovereign became every day more desperate by the capture of his armies and the surrender of his fortified places, the demands of the French rose in proportion, and at length Napoleon explicitly declared that he would never quit Berlin nor evacuate Poland

till Moldavia and Wallachia were yielded by the Russians in complete sovereignty to the Porte, and till a general peace was concluded on the basis of the restitution of all the Spanish, French, and Dutch colonies and possessions taken by Great Britain during the war. With this declaration all hopes of peace vanished: instead of which an armistice was proposed by the French, and, after much fruitless negotiation, concluded by Lucchesini, on the 16th of November; but the terms were so disadvantageous that the King of Prussia, on the 22d, refused to ratify it, and the war was prosecuted with unremitted activity. Perhaps Count Bismarck happens to remember this history of the events which occurred in October and November sixty-four years ago, when Count von Moltke was an innocent child of seven years old, and has been in some degree influenced by the precedents afforded by the conduct of the Emperor Napoleon I. toward Prussia in 1806.

France's Future.

The recovery of a nation after loss, conquest, pestilence, famine, is not unfrequently recorded in history; but a nation that has fallen to pieces by its internal disorganization does not for long—sometimes does not for ages—reassert its place in the world. The eclipse which came upon Greece and upon Italy lasted for centuries, and has not passed away. In later times the glory of Spain departed, and has never returned. These considerations must appall one who looks now at prostrate France. Not her present misfortunes only, but the dark days that are before her, excite emotion, the one raising pity, the other shutting out hope. France the fair, the romantic, the brave, the legendary, to sink into a base country, clinging to her ancient pride and ancient pretension, is sad to contemplate. Yet if what has been be any guide to the knowledge of what is to be, France must for many a day, perhaps for many a century, experience the bitterness of humiliation. Of all the great institutions which she owned in her days of renown, not one remains to serve as a rallying-point. So utterly has she failed that her reconstruction cannot be immediate or speedy; it must be the work of generations.

Nevertheless, strongly as the analogies may press in a political view, there is a ground of hope for France which was wanting to the fallen countries with which we have compared her. Greece, Italy, Spain, are all peninsulas, on the skirts of the Continent. It required amazing *vis* to give them their predominance at all, and, when their energy disappeared, insignificance naturally ensued. Their geographical position, in spite of which they raised themselves, gave them no assistance when they began to fail; it rather served to teach the rest of Europe how well affairs could go on without these excrescences, which belong more to the sea than to the land. But her geographical situation must always work powerfully in favor of France. Europe can never go on its way unmindful of her—can never say, as long as she is a nation, that her voice shall be entirely unheeded in council. It may be that, like the potent Hebrew's, her hair may begin to grow again after she has been shaven, and some tokens of her great strength to return. Alas that, like him, she should be fatally blind!

The Prussian Field-post.

The *feld-post*, which is, without any exception, the greatest blessing that a government ever gave an army, is composed as follows: Each *corps d'armée* has a head postmaster, under whom are the following staff: seven clerks attached to the office of the headquarters, four at

the headquarters of each division, and three with the artillery of each corps. Besides this, he has fourteen letter-sorters and seventeen positions. The headquarter staff-post of a *corps d'armée* has two wagons, one chaise, and one fourgon. The first ply with the letters, the second carries the postmaster and his second when on the march, as well as small parcels. In order to give additional facilities to the soldier to write to his friends, the authorities have issued cards to each regiment, on one side of which is printed—

Feld-post Correspondenz Karte.

To

Address,

and, on the other side, the letter is written in pencil or ink. If in the former, it is rendered perfectly secure against being rubbed out by the application of a wet cloth across it, which, thanks to some preparation on the surface of the card, secures its legibility to the end of its journey. The number of letters sent off after a battle is almost incalculable. It is, indeed, estimated that every sixth person left conscious writes. In order that every chance of writing should be given, postillions ride over the field with cards and a pencil the day after the battle, and any wounded man who is still there can either write or dictate his message home.

Rats as Food.

The Paris correspondent of the *London Times*, discoursing on the subject of rats as food, says: "There is no knowing what you can eat until you try. This morning I met a friend on the Boulevards, about breakfast-time, who asked me to come with him to Haul's, as he had there ordered rats. I agreed to go and just look at them. They looked very good, served up in a salmis, with gravy and toast, and my friend pronounced them excellent; and so I did eat, or rather taste, and am obliged to confess that I should have no objection to repeat the experiment to-morrow. The flesh was white and very delicate, like young rabbit, but with more flavor. We curiously inspected the bill to see whether the proprietor of the restaurant would venture to give the dish its real name, but there was only a significant blank space, and then one franc fifty centimes. On being remonstrated with for this unbusiness-like method of procedure, he wanted to write 'salmis de gibier,' the word 'rat' being quite impossible. As there were two rats, salmis, each cost about seven pence, but bought wholesale (I am told they are now exhibited publicly for sale in some shops) and cooked at home, they would, perhaps, be cheap eating, even in time of siege; only, unluckily, the poor people, who want them most, would be the last to consent to touch them."

Causes of French Failure.

France failed in the present war because, both morally and physically, her entire social system—if system it deserved to be called—was rotten to the core. A government of force resting upon universal corruption could not fail to be ill served in every department of the state, and in none more so than in that on which its very existence depended—the department of war. Even in point of numbers the French army, when hostilities broke out, proved to be far below the standard that had been set for it; while in all the other qualities which contribute to make armies formidable it was entirely wanting. The temper of the men appears to have been arrogant, presumptuous, braggart; the regimental officers, especially in the subaltern ranks, were for the most part ignorant and underbred persons. Discipline, in our sense of the term, there was

none. The generals showed no acquaintance at all, or next to none, with the first principles of that art of which the outward world gave them credit for being masters; and the system of administration and supply, the *intendance militaire*, broke down as soon as an easy strain was put upon it. For three weeks the corps which had been thrust rashly to the front lay idle for lack of stores and means of transport. They took up, likewise, and retained positions which would have been barely safe had a prompt and well-arranged advance into the enemy's country been contemplated; but which, as ground to be held by troops waiting till their magazines should be formed and a plan of campaign settled, were perilous in the extreme. And, more remarkable still, both then and throughout the whole of the campaign, the outpost arrangements of the French army were as faulty as can well be conceived. When we read, in short, of what, in all these respects, Napoleon III. and his people did, both in preparing for a struggle which they knew to be a critical one, and conducting themselves in presence of the enemy, we can hardly bring ourselves to believe that we are following the fortunes of the descendants and representatives of those redoubted warriors who, sixty years ago, overthrew the Continental armies wherever they encountered them on any thing like equal terms.

Causes of German Success.

One great cause of the astounding success of the Germans in this war is to be found in this, that, superadded to the excellency of their system of recruitment, they have the best-instructed staff in the world, which have revolutionized for them the tactics, or practical portion, of the art of war as completely as their own Frederick did a century or more ago; and even more than was done, not so much by Napoleon himself as by the course of events during the first days of the French Revolution, and the skill with which he seized the result and improved upon it. Another is to be found in the perfection of their equipment in every arm, and the admirable order which prevails in their *intendance* or department of supply.

Miscellany.

Furs and the Fur-trade.

WHILE our article on this subject, in the *JOURNAL* of December 24th, was passing through the press, we received from Mr. William Maenaughtan, fur commission-merchant, New York, the successor in business of the late Ramsay Cooks, so long the partner and survivor of John Jacob Astor, and so often mentioned in that charming book, Irving's "Astoria," a very interesting table, evidently compiled with great labor and care, giving the sales in each year, from 1859 to 1870, of furs in London by the Hudson's-Bay Company and Messrs. C. M. Lampson & Co. As the sales of these parties comprise fully three-fourths of the American furs sold in the world in any year, they give a more accurate approximation to the entire fur-production of the globe than can otherwise be obtained. We have not the space, nor is it appropriate to the character of the *JOURNAL*, to insert this table entire; but some notes deduced from it will be of interest to our readers. The sable, ermine, Kolenski, and Hudson's-Bay sable, are not among the furs sold by these parties, Leipzig being the largest and best market for them. By far the rarest and most precious of the furs on their list is that of the silver-fox, a very rare animal, found only in our extreme northern latitudes.

Of this costly and beautiful fur, sold almost exclusively to the nobles of Northern Europe, but five hundred and forty-one skins were sold in 1865, and, for five years of the eleven, the annual supply was less than eight hundred skins. In 1869 the unprecedented number of twenty-four hundred and twenty were put upon the market, and, in 1870, there were nineteen hundred and ten sold. The cross-fox, also a very beautiful animal, is also rare; the highest number of skins sold being six thousand two hundred and ninety-one, in 1869, while the number sent to market, in 1865, was but twenty-three hundred and five, and the quantity had vibrated between these two extremes through the whole eleven years.

The pelts of the different species and varieties of the bear ranged in the different years from seven thousand to nearly thirteen thousand, and the wolf-skins from four thousand to twelve thousand six hundred. On the whole, judging from this table, wolves seem to be decreasing. The number of mink-skins had exceeded one hundred thousand only twice in the eleven years, viz., in 1860 and 1869, ranging for the remainder of the time from fifty to ninety-five thousand. The marten-skins, including the pine, the stone, and perhaps also the fitch marten, range from seventy-eight thousand eight hundred and thirty-eight, in 1870, to one hundred and forty-seven thousand and ninety-one, in 1859. In 1866 they nearly reached the highest number.

The muskrat, or musquash, is much the most abundant of our American fur-bearing animals, and even the large average sale of its skins by these parties, amounting to about two million a year, and in some years rising to two million two hundred thousand, does not give an adequate idea of its abundance. More than a million, and possibly two million, muskrat-skins are consumed here without crossing the ocean. A similar remark may be made concerning the skins of the skunk, or, as it is now generally called, the black-marten, or Alaska sable. Since its introduction as a fashionable fur here, large numbers of the skins are offered to our fur-dealers directly, instead of being shipped to Europe. There has been, in consequence, an apparent falling-off in the numbers sold in the European markets, while there is an actually increasing consumption of these really elegant furs. The maximum of sales in the London market was reached in 1860, when one hundred and forty-five thousand six hundred and seventy-nine were sold by the two parties named above, and, though very nearly the same point was reached in 1864, the sales since that time there have been, in round numbers, seventy-eight thousand, sixty-one thousand, one hundred and nine thousand six hundred, seventy thousand four hundred, eighty-four thousand three hundred, and, in 1870, fifty-five thousand six hundred and thirty-nine. We think the consumption in this country the present winter will be nearly double this. The fur of the raccoon is almost exclusively used in Germany, Poland, and Russia, and very few of the half-million of raccoon-skins sold annually in London will find their way back to this country.

Nothing in this table has more surprised us than the large number of beaver-skins sold in London. We had supposed that the beaver was becoming a rare animal, and that, with the substitution of the nutria and muskrat for the finer qualities of fur-hats, and the rabbit and domestic cat for the cheaper grades, the beaver had ceased to be hunted so zealously as he was twenty-five or thirty years ago; but this table shows, in the sales of these two houses, an average of one hundred and fifty thousand skins during the entire eleven years,

and, in 1867, one hundred and seventy-six thousand four hundred and eighty-eight, and, in 1870, one hundred and sixty-five thousand two hundred and thirty-two skins. These amounts would seem to indicate an increase in the number of beavers, and a steady demand for their fur abroad, if not at home.

Of the other animals whose furs were sold during these eleven years, there is little particularly worthy of notice. The lynx, of which, in 1863, 1864, and 1865, an average of only about fifty-five hundred skins were sold, suddenly shot up, in 1868 and 1869, to nearly eighty thousand, a greater comparative increase than any other animal in the list, though the opossum rose from twenty-three thousand and sixty-five, in 1863, to two hundred and fourteen thousand one hundred and seventy-seven, in 1867. Both furs are increasing rapidly in demand in the European markets, but the increase in supply of the lynx must arise from their being more thoroughly hunted, and not from any considerable multiplication of their number, for, unlike the opossum, the lynx is not remarkably prolific.

Cigarettes.

The tobacco used in the Havana factory comes chiefly from the small plantations in the western part of Cuba. When brought in, the first process is to place it on a sieve-table, set in motion by machinery. This sifts away all the sand and other foreign bodies from the leaf, twelve skilful workmen standing on either side of the table to snatch away all bad leaves or stems from the mass, as it travels along by the pressure of the mechanism. It is next thrown upon a huge ventilator, which winnows off the dust, and after that it is spread in thin layers on outside terraces, where the tropical sun can have full play upon it and dry it thoroughly. It is then taken inside and dropped into huge casks, where it is subjected to intense hydraulic pressure, after which it is conveyed by an almost imperceptible motion, effected by means of a series of screws, beneath a huge fly-wheel, set with sharp blades, that chop it to pieces. Then it is again ventilated, winnowed, and subjected to the action of fluer cutting apparatus, until it is reduced to the desired tenuity, after which it is spread out on the lower floor of the building, and besprinkled with an aromatic liquid, the composition of which is a secret of the manufacture. Chinamen alone are employed at this last stage, because their ignorance is regarded as a guarantee that the secret will not be betrayed. The tobacco, being once more partially dried, now requires only its paper envelopes. For these the material comes from Spain, and the Havana cigarette-maker imports thirty-five thousand bales of it per annum. The paper is passed beneath a press, which stamps it indelibly, and is then submitted to a mechanical knife, which cuts off hundreds of wrappers at a stroke. The final process consists of the folding and packing, and these are intrusted to hundreds of hands, some permanently employed, some working in their own rooms outside, some inmates of charitable institutions, and even of prisons. In one saloon a visitor saw three hundred convicts, black and white, hard at work rolling the cigarettes delicately between their fingers. Every workman gets a certain quantity of tobacco and wrappers, and must deliver a round of five thousand cigarettes from it, with perhaps fifty over, which he is allowed to keep for his own use. For this amount of work he gets from the overseer a metal check, entitling him to the payment of one dollar, at sight, on presentation to the cashier or for-man. Every thing, of course, is

strictly controlled and checked, with all the aid of scientific arrangement and apparatus.

Horace Walpole.

Horace Walpole has been condemned by Lord Macaulay, as "the most eccentric, the most artificial, the most fastidious, the most suspicious of men." His mind was a bundle of inconsistent whims and affectations. In every thing in which he busied himself, in the fine arts, in literature, in public affairs, he was drawn by some strange attraction from the great to the little, and from the useful to the odd. . . . There is scarcely a writer in whose works it would be possible to find so many contradictory judgments, so many sentences of extravagant nonsense." What, then, is the secret of Walpole's success? Let Macaulay answer: "No man who has written so much, is so seldom tiresome. In his books there are scarcely any of those passages which, in our school-days, we used to call *skip*. Walpole's superiority lay not in industry, not in learning, not in accuracy, not in logical power, but in the art of writing what people will like to read. He rejects all but the attractive parts of his subject. He keeps only what is in itself amusing, or what can be made so by the artifice of his diction."

"The Castle of Otranto" was first published in 1764, by Horace Walpole, anonymously, as a work found in the library of an ancient Roman-Catholic family in the north of England, and printed at Naples, in black-letter, in 1529; when almost everybody was imposed upon. The ancient romances have nothing more incredible than a sword which required a hundred men to lift it; or a helmet by its own weight forcing a passage through a courtyard into an arched vault, big enough for a man to go through; yet the locality is real, and is a massive fortress at Otranto, at the southern extremity of the kingdom of Naples. Walpole tells us the origin of this romance; how he waked one morning from a dream in which he thought himself in an ancient castle, and that, on the uppermost banister of a great staircase, he saw a gigantic hand in armor. In the evening he sat down and began to write, without knowing in the least what he intended to say or relate. The work grew on his hands, and he grew fond of it. "In short," says Walpole, "I was so engrossed with my tale, which I completed in less than two months, that one evening I wrote from the time I had drunk my tea, about six o'clock, till half an hour after one in the morning, when my hand and fingers were so weary, that I could not hold the pen to finish the sentence, but left Matilda and Isabella talking, in the middle of a paragraph."

A Hindoo View of our Dinners

Baboo Keshub Chunder Sen, the converted Hindoo gentleman, whose lectures and addresses in England attracted so much attention last season, has returned to India and recounted to an assembly in the hall of the Franjee Cowasjee institute at Bombay his impressions of society. His address lasted an hour and a half, after which "Theistic hymns were sung." There was, says the *Bombay Times*, "an immense concourse of native gentlemen on the occasion; only two or three Europeans were present." The Baboo expressed thus his horror at the shocking sights he had seen in carnivorous England:

"I was invited to many dinner-parties, and what did I invariably see there? Why, the dining-room appeared to be more like a zoological garden; there were all sorts of fowls of the air, and beasts of the wilderness, and fishes of the sea, and creeping things laid on the table."

(Laughter.) "They were about to start into a new life, as it were." (Shrieks of laughter.) "I need not say I could not positively say whether they were alive or dead. These are the things which our English friends eat. I am glad I have run away from England." (Laughter.) "Oh Indian curry and rice, I must have them soon! But English fashions and dinners! These are really two things that are barbarous. I think there ought to be a protest against what is called 'fashion' in England. It is a dangerous thing, and makes frightful progress. The tail of the ladies' dress should be protested against, and the horrors of English dinners ought to be protested against; and if you, my countrymen, are really anxious to promote the welfare of your country, avoid these two things." (Laughter.) "Import into your country all that is good in England, but not these horrid things."

An Old Trojan.

Anthony Pecour, the oldest inhabitant of Troy, died December 9, 1870. He was born September 16, 1761, and was, therefore, a little more than one hundred and nine years old when he died. Up to within a few days of his death he was tolerably hale and hearty, and had never fallen into the doctor's hands until within two years. Of late years his personal appearance indicated his great age. He was about five feet and four inches in height, and considerably bent. He walked easily with the aid of a cane, and took daily walks out of doors. He stated that, except for a defective sight and hearing, he felt as young as he did at fifty. He attributed his longevity to plenty of exercise and correct habits. Mr. Pecour was not a teetotaler, however, as he took his "grog," as he called it, with clock-like regularity. He had been thrice married, and the father of thirteen children. The oldest Trojan appropriately lived in the oldest house in Troy. It is known as the "Vanderheyden mansion," and was built in 1752—one hundred and eighteen years ago. It is exceeding quaint in appearance, has a peaked roof and gables in the old Dutch style, and looks strangely out of place amid its modern surroundings. The brick with which it was built was imported from Holland, as was the material of many of the residences of the old Dutch farmers of the Hudson and Mohawk Valleys. In the gable-end, carved on the surface of a brick, is the following inscription: "M. V., 1752." The initials were those of its first owner, Matthias Vanderheyden. During the Revolution it was used as the headquarters of General Schuyler, while on his way to meet Burgoyne at Saratoga. During the entire war this house was the rendezvous of army officers, the Vanderheydens being hospitable and patriotic. It was twenty-three years old when the first Revolutionary battle was fought, yet the walls are firm, and the dingy old structure seems likely to stand for many years.

The Growth of London

One of the most surprising things about modern London is the rapidity of its growth. Notwithstanding its already enormous size in 1849, not fewer than 225,322 new houses have been added to it since then, forming 69 new squares, and 5,831 new streets, of the total length of 1,030 miles! Nor has the growth of London apparently been checked, notwithstanding adverse times; for 5,167 houses were in course of erection in the month of February last. In short, as the French observer said of London, "It is not so much a city, as a province covered by houses." The growth of London, however, has only kept pace with the

power, population, and wealth of the empire. It is the seat of the court, the government, and the legislature; of the supreme courts of law; of science, art, and justice; and it might almost be described as the centre of the world's commerce. While it is the capital of Great Britain and its vast colonial dependencies, London is also in a measure regarded as the capital of modern industry, to which men of energy and enterprise resort, not only from the counties and distant provinces, but from the various countries of Europe, and indeed from nearly all parts of the habitable globe.

The Widow of James Hogg.

A lady well known to Sir Walter Scott, "Christopher North," Allan Cunningham, Lockhart, and other literary men, died recently at Bellevue Place, Linlithgow, where she had resided for the past fifteen years. Margaret Phillips, widow of James Hogg "The Ettrick Shepherd," was the daughter of an Annandale farmer. She was married to the poet in 1814, and, until his death, presided with much grace and amiability over his only too hospitable home. It was her fate to survive her gifted husband thirty-five years. Many of the multitude of friends who surrounded the poet would have been glad to have shown his respected widow their sense of old kindnesses, but she shrank from every thing like notoriety and society. Her death took place in the presence of her only son, who returned two years ago from service in India, and her three surviving daughters. The deceased was an excellent, and, in many respects, a remarkable character. Her memory was extraordinary, and she delighted to entertain her friends with reminiscences of Scott, Professor Wilson, Lockhart, Wilkie, and "Honest Allan," as Sir Walter was in the habit of calling Cunningham, as well as other distinguished friends and associates of the "Shepherd." James Hogg, had he survived his wife, would have been nearly a century old. He was born in 1772, and married when he had passed the middle stage of life, she being, as the phrase is, "young enough to be his daughter." Having been celebrated by him in more than one of his best poems, "Bonnie Maggie" justified his choice by a married life of steadfast and loving duty. She received a pension of fifty pounds per annum from the British Government, and another of forty pounds from the Duke of Buccleugh. Her remains were interred in Warriston Cemetery, Edinburgh.

Varieties.

NOT long ago the body of a deceased native was carried down to the banks of the Juna, at Etawha, India, to be burned. The pile was made and the wood was lighted, and while waiting so as to give some little time for a good blaze, the men moved off to a little distance, squatting themselves down to have a smoke. A huge crocodile, seemingly watching their movements, rushed out of the water at this point of the ceremony, seized the corpse and doubled back, making a tremendous header into the river with the body between his jaws, leaving the followers and mourners in perfect bewilderment.

There has been a discussion in England as to the value of acorns as food for cattle. Some persons say they are poisonous, while others estimate the acorn-crop in that country last year as worth more than a million sterling. The fact seems to be that acorns, dry and ripe, are very valuable food for swine and sheep, if taken in moderation.

A West Hickory Pennsylvania farmer lately heard a scratching under his bed. Putting on his trousers, he reached for the intruder, and in a minute found himself in the corner, partly scalped, with his lower limbs looking as though

he had been through a wool-carding machine, while with a spit and a growl, a catamount disappeared through the open window.

At a recent examination of one of the schools in Washington, the question was put to a class of small boys: "Why is the Connecticut river so called?" when a bright little fellow put up his hand. "Do you know, James?" "Yes, ma'am, because it connects Vermont and New Hampshire and cuts through Massachusetts!"

The Philadelphia *Medical and Surgical Review* does not "know of any drug which would produce the immediate yet temporary insensibility which is popularly supposed to follow the use of drugged liquor," and is of the opinion that the talk about liquor having been drugged is only a sort of apology for having been drunk.

A correspondent states that while riding from Philadelphia to New York he accepted a cigar from a stranger and discovered, just in season to save himself, that it was drugged. A new dodge to aid in robbery in the cars.

Lady—"Four of those chairs which I so lately purchased of you are broken." Upholsterer—"Indeed, madam! The only way in which I can account for that is, that some one must have been sitting on them."

"I find, Dick, that you are in the habit of taking my jokes and passing them off as your own. Do you call that gentlemanly conduct?" "To be sure I do, Tom. A true gentleman will always take a joke from a friend."

The Chinese in Belleville, New Jersey, are rapidly winning their way into public favor. They attend to their business, molest no one, and are in every respect model workmen. Many of them attend divine service regularly.

If your lips you would save from slips,
Five things observe with care:
Of whom you speak—to whom you speak—
And how—and when—and where.

Miss Thompson, ordained to the ministry at the late Michigan Universalist State Convention, is described as the most graceful female orator in the country.

The Congressional Library now numbers about two hundred and ten thousand volumes, having had a large addition through the new law regulating copyrights.

Next to Massachusetts, Connecticut, and Rhode Island, New Jersey is the most densely populated of the States. She has one hundred and seven to the square mile.

A newly-imported Chinese, on the occasion of his first job for a bill-poster at Northampton, Massachusetts, carefully stuck all his bills upside down.

The largest farm in England contains three thousand acres. The live-stock kept on this farm is valued at sixty-four thousand five hundred dollars.

There is a verdict on record in one of the counties of Minnesota, rendered in a murder trial, in the following words: "Not guilty if he'll quit the State."

A lady died recently in Boston, aged eighty, who had not been out of the house for forty years.

A photographer in Glasgow has received orders from a London house for sixty thousand photographs of the Marquis of Lorn.

A shoemaker writes that he is not only willing to give a woman her rights, but her "rights and lefts."

Chicago has more wooden houses, and Philadelphia less of them, than any other large cities of the country.

An Irish painter declares in an advertisement that among other portraits he has a representation of "Death as large as life."

The London *Times* remarks that there are not ten Irishmen in Ireland who do not think of coming to America some time or other.

Professor Eaton has discovered that this globe will support human life only twenty-six million years longer.

Fashionable young lady, detaching her hair previous to retiring: "What dreams may come when we have shuffled off this mortal coil!"

Council Bluffs, Iowa, has a very high-graded school. It is three hundred feet above the street grade.

Austria, according to late census returns, has a population of 35,943,592 souls.

The population of the United States, according to the census just taken, is 38,674,463.

The music-teacher who broke his engagement is called "a tuneful lyre."

As we often hear of flying bricks, we ought not to be astonished at hearing a chimney-flue.

The surest way of getting into a scrape is to go to a Russian bath.

A good housewife's motto—whatever thou dost, dust it with all thy might.

There are four Episcopal churches in Ohio that discard the use of the surplice.

In Florida they are making "orange-brandy."

A Polish woman is captain, surgeon, and chaplain, of a company of French volunteers.

The Museum.

THERE has been much learned discussion as to whether the fondness for coffee, so decidedly expressed in modern civilization, is an acquired or natural taste. Possibly the fact that our native American savages are passionately fond of this beverage, and take to it instantly the fragrant perfume reaches their nostrils, is a very satisfactory solution in favor of the position that coffee was intended for man's happiness as much as are the fruits of the garden and the grains of the field. On occasions when our "Indians of the Plains" meet "government agents," to receive their annuities or transact other business, it is the custom among well-disposed "officials" to give the Indian a treat of deliciously-strong coffee, which has all the effect of exhilaration without the pernicious consequences of whiskey. To the savage who has never been in contact even with its fragrance, the perfume of roasting coffee, the first time perceived, will attract his attention. His nostrils will dilate, and his eyes express astonished satisfaction and inquiry. In spite of himself, and his habit of appearing indifferent to novelties, he will move toward the point of attraction, his yearning palate demanding the satisfaction of the taste of coffee.

The Indians do every thing, as nearly as possible, their own way; and, when drinking coffee in numbers, they wait patiently until every man has his cup equally well filled, and then in unison pour it down their capacious throats, then stopping simultaneously to recover their breath and give their peculiar "grunt" of satisfaction. They then commence again, and, to a person who could hear and not see, an impression is left by the gurgling noises that large numbers of pet pigs of an enormous size have been suddenly provided with an indefinite quantity of buttermilk, each individual pig making a thorough hog of itself in its determination to guzzle down the delicious food.

Instances are known where Indians, having once obtained a taste for coffee, have travelled two and three hundred miles to gratify their appetite, and their avidity to do this has been so great that they would, in addition to their long journeys, sacrifice every thing they possessed for the temporary enjoyment.

On one of these coffee-drinking occasions

there was present a "rising brave," who wore upon his shoulders a buffalo-robe, remarkable for its size, beauty of its coat, and elaborate ornamentation. It was really an imperial robe, and was never surpassed in utility or beauty by the grandest trapping of a royal Goth or Vandal. The trader endeavored to purchase this prize, but the savage owner scorned all

offers, and, wrapping it about his person, wore it with a grace and dignity that was befitting a true sovereign of the forest. Finally, the "occasion" ended with the usual treat of coffee. The owner of the coveted robe was one of the first to gratify his taste with the beverage; it operated on him as a new revelation from the Great Spirit. He seemed instantly infatuated,

and pressed forward for more. Contrary to his expectations, he was gratified, and in the exuberance of his delight and munificence of his gratitude he threw his magnificent robe over the shoulders of the trader. It was to the untutored mind of the savage his most eloquent expression of the pleasure he had so unexpectedly received.

A Coffee-Treat among the Indians.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

["RALPH THE HEIR," SUPPLEMENT NO. XIV.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF JANUARY 7.]

CHAPTER XL.

WHAT SIR THOMAS THOUGHT ABOUT IT.

SIR THOMAS UNDERWOOD had been engaged upon a very great piece of work ever since he had been called to the bar in the twenty-fifth year of his life. He had then devoted himself to the writing of a life of Lord Verulam, and had been at it ever since. But as yet he had not written a word. In early life, that is, up to his fortieth year, he had talked freely enough about his *opus magnum* to those of his compcers with whom he had been intimate; but of late Bacon's name never had been on his lips. Patience, at home, was aware of the name and nature of her father's occupation, but Clarissa had not yet learned to know that he who had been the great philosopher and little lord-chancellor was not to be lightly mentioned. To Stem the matter had become so serious, that, in speaking of books, papers, and documents, he would have recourse to any periphrasis rather than mention in his master's hearing the name of the fallen angel. And yet Sir Thomas was always talking to himself about Sir Francis Bacon, and was always writing his life.

There are men who never dream of great work, who never realize to themselves the need of work so great as to demand a lifetime, but who themselves never fail in accomplishing those second-class tasks with which they satisfy their own energies. Men these are who to the world are very useful. Some few there are, who, seeing the beauty of a great work, and believing in its accomplishment within the years allotted to man, are contented to struggle for success, and struggling, fail. Here and there comes one who struggles and succeeds. But the men are many who see the beauty, who adopt the task, who promise themselves the triumph, and then never struggle at all. The task is never abandoned; but days go by and weeks; and then months and years—and nothing is done. The dream of youth becomes the doubt of middle life, and then the despair of age. In building a summer-house it is so easy to plant the first stick, but one does not know where to touch the sod when one begins to erect a castle. So it had been with Sir Thomas Underwood and his life of Bacon. It would not suffice to him to scrape together a few facts, to indulge in some fiction, to tell a few anecdotes, and then to call his book a biography. Here was a man who had risen higher and was reported to have fallen lower—perhaps, than any other son of Adam. With the finest in-

tellect ever given to a man, with the purest philanthropy and the most enduring energy, he had become a by-word for greed and injustice. Sir Thomas had resolved that he would tell the tale as it had never yet been told, that he would unravel facts that had never seen the light, that he would let the world know of what nature really had been this man—and that he would write a book that should live. He had never abandoned his purpose; and now, at sixty years of age, his purpose remained with him, but not one line of his book was written.

And yet the task had divorced him in a measure from the world. He had not been an unsuccessful man in life. He had made money, and had risen nearly to the top of his profession. He had been in Parliament, and was even now a member. But yet he had been divorced from the world, and Bacon had done it. By Bacon he had justified to himself—or rather had failed to justify to himself—a seclusion from his family and from the world which had been intended for strenuous work, but had been devoted to dilettante idleness. And he had fallen into those mistakes which such habits and such pursuits are sure to engender. He thought much, but he thought nothing out, and was consequently at sixty still in doubt about almost every thing. Whether Christ did or did not die to save sinners was a question with him so painfully obscure that he had been driven to obtain what comfort he might from not thinking of it. The assurance of belief certainly was not his to enjoy—nor yet that absence from fear which may come from assured unbelief. And yet none who knew him could say that he was a bad man. He robbed no one. He never lied. He was not self-indulgent. He was affectionate. But he had spent his life in an intention to write the life of Lord Verulam, and, not having done it, had missed the comfort of self-respect. He had intended to settle for himself a belief on subjects which are, of all, to all men the most important; and, having still postponed the work of inquiry, had never attained the security of a faith. He was forever doubting, forever intending, and forever despising himself for his doubts and unaccomplished intentions. Now, at the age of sixty, he had thought to lessen these inward disturbances by returning to public life, and his most unsatisfactory alliance with Mr. Griffenbottom had been the result.

They who know the agonies of an ambitious, indolent, doubting, self-accusing man—of a man who has a skeleton in his cupboard as to which he can ask for sympathy

from no one—will understand what feelings were at work within the bosom of Sir Thomas when his Percycross friends left him alone in his chamber. The moment he knew that he was alone he turned the lock of the door, and took from out a standing desk a whole heap of loose papers. These were the latest of his notes on the great Bacon subject. For, though no line of the book had ever been written—nor had his work even yet taken such form as to enable him to write a line—nevertheless, he always had by him a large assemblage of documents, notes, queries, extracts innumerable, and references which in the course of years had become almost unintelligible to himself, upon which from time to time he would set himself to work. Whenever he was most wretched he would fly at his papers. When the qualms of his conscience became very severe, he would copy some passage from a dusty book, hardly in the belief that it might prove to be useful, but with half a hope that he might cheat himself into so believing. Now, in his misery, he declared that he would bind himself to his work and never leave it. There, if anywhere, might consolation be found.

With rapid hands he moved about the papers, and tried to fix his eyes upon the words. But how was he to fix his thoughts? He could not even begin not to think of those scoundrels who had so misused him. It was not a week since they had taken fifty pounds from him for the poor of Percycross, and now they came to him with a simple statement that he was absolutely to be thrown over! He had already paid nine hundred pounds for his election, and was well aware that the account was not closed. And he was a man who could not bear to speak about money, or to make any complaint as to money. Even though he was being so abominably misused, still he must pay any further claim that might be made on him in respect of the election that was past. Yes—he must pay for those very purchased votes, for that bribery, as to which he had so loudly expressed his abhorrence, and by reason of which he was now to lose his seat with ignominy.

But the money was not the worst of it. There was a heavier sorrow than that arising from the loss of his money. He alone had been just throughout the contest at Percycross; he alone had been truthful, and he alone straightforward! And yet he alone must suffer! He began to believe that Griffenbottom would keep his seat. That he would certainly lose his own, he was quite convinced. He might lose it by undergoing an adverse petition, and paying ever so much

more money—or he might lose it in the manner that Mr. Trigger had so kindly suggested. In either way there would be disgrace, and contumely, and hours of the agony of self-reproach in store for him!

What excuse had he for placing himself in contact with such filth? Of what childishness had he not been the victim when he allowed himself to dream that he, a pure and scrupulous man, could go among such impurity as he had found at Percycross, and come out, still clean and yet triumphant? Then he thought of Griffenbottom as a member of Parliament, and of that Legislation and that Constitution to which Griffenbottoms were thought to be essentially necessary. That there are always many such men in the House he had always known. He had sat there and had seen them. He had stood shoulder to shoulder with them through many a division, and had thought about them—acknowledging their use. But now that he was brought into personal contact with such a one, his very soul was aghast. The Griffenbottoms never do any thing in politics. They are men of whom in the lump it may be surmised that they take up this or that side in politics, not from any instructed conviction, not from faith in measures or even in men, nor from adherence either through reason or prejudice to this or that set of political theories—but simply because on this side or on that there is an opening. That gradually they do grow into some shape of conviction from the moulds in which they are made to live, must be believed of them; but these convictions are convictions as to divisions, convictions as to patronage, convictions as to success, convictions as to Parliamentary management; but not convictions as to the political needs of the people. So said Sir Thomas to himself as he sat thinking of the Griffenbottoms. In former days he had told himself that a pudding cannot be made without suet or dough, and that Griffenbottoms were necessary if only for the due adherence of the plums. Whatever most health-bestowing drug the patient may take would bestow any thing but health were it taken undiluted. It was thus in former days Sir Thomas had apologized to himself for the Griffenbottoms in the House; but no such apology satisfied him now. This log of a man, this lump of suet, this diluting quantity of most impure water; 'twas thus that Mr. Griffenbottom was spoken of by Sir Thomas to himself as he sat there with all the Bacon documents before him—this politician, whose only real political feeling consisted in a positive love of corruption for itself, had not only absolutely got the better of him, who regarded himself at any rate as a man of mind and thought, but had used him as a puppet, and had compelled him to do dirty work. Oh—that he should have been so lost to his own self-respect as to have allowed himself to be dragged through the dirt of Percycross!

But he must do something—he must take some step. Mr. Griffenbottom had declared that he would put himself to no expense in defending the seat. Of course he, Sir Thomas, could do the same. He believed that it

might be practicable for him to acknowledge the justice of the petition, to declare his belief that his own agents had betrayed him, and to acknowledge that his seat was indefensible. But, as he thought of it, he found that he was actually ignorant of the law in the matter. That he would make no such bargain as that suggested to him by Mr. Trigger; of so much he thought that he was sure. At any rate he would do nothing that he himself knew to be dishonorable. He must consult his own attorney. That was the end of his self-deliberation—that, and a conviction that under no circumstances could he retain his seat.

Then he struggled hard for an hour to keep his mind fixed on the subject of his great work. He had found an unknown memoir respecting Bacon, written by a German pen in the Latin language, published at Leipsic shortly after the date of Bacon's fall. He could translate that. It is always easiest for the mind to work, in such emergencies, on some matter as to which no creative struggles are demanded from it.

CHAPTER XLI.

A BROKEN HEART.

It was very bad with Clarissa when Ralph Newton was closeted with Mary at Popham Villa. She had suspected what was about to take place, when Sir Thomas and Ralph went together into the room; but at that moment she said nothing. She endeavored to seem to be cheerful and attempted to joke with Mary. The three girls were sitting at the table on which lunch was spread—a meal which no one was destined to eat at Popham Villa on that day—and thus they remained till Sir Thomas joined them. "Mary," he had said, "Ralph Newton wishes to speak to you. You had better go to him."

"To me, uncle?"

"Yes, to you. You had better go to him."

"But I had rather not."

"Of course you must do as you please, but I would advise you to go to him." Then she had risen very slowly and had gone.

All of them had understood what it meant. To Clarissa the thing was as certain as though she already heard the words spoken. With Patience even there was no doubt. Sir Thomas, though he had told nothing, did not pretend that the truth was to be hidden. He looked at his younger daughter sorrowfully, and laid his hand upon her head caressingly. With her there was no longer any possibility of retaining any secret, hardly the remembrance that there was a secret to retain. "Oh, papa," she said—"oh, papa!" and burst into tears.

"My dear," he said—"believe me that it is best that it should be so. He is unworthy." Patience said not a word, but was now holding Clarissa close to her bosom. "Tell Mary," continued Sir Thomas, "that I will see her when she is at liberty. Patience, you can ask Ralph whether it will suit him to stay for dinner. I am tired and will go up-stairs my-

self." And so the two girls were left together.

"Patty, take me away," said Clarissa. "I must never see him again—never—nor her."

"She will not accept him, Clary."

"Yes, she will. I know she will." She is a sly, artful creature. And I have been so good to her."

"No, Clary—I think not—but what does it matter? He is unworthy. He can be nothing to you now. Papa was right. He is unworthy."

"I care nothing for that. I only care for him. Oh, Patty, take me away. I could not bear to see them when they come out."

Then Patience took her sister up to their joint room, and laid the poor sufferer on the bed, and, throwing herself on her knees beside the bed, wept over her sister and caressed her. That argument of Ralph's unworthiness was nothing to Clarissa. She did not consider herself to be so worthy but what she might forgive any sin, if only the chance of forgiving such sin were given to her. At this moment in her heart of hearts her anger was more against her rival than against the man. She had not yet taught herself to think of all his baseness to her—had only as yet had time to think that that evil had come upon her which she had feared from the first moment of her cousin's arrival.

Presently Patience heard the door opened of the room down-stairs and heard Mary's slow step as she crossed the hall. She understood well that some one should be below, and, with another single word of affection to her sister, she went down-stairs. "Well, Mary," she said, looking into her cousin's face.

"There is nothing particular to tell," said Mary, with a gentle smile.

"Of course we all knew what he wanted."

"Then of course you all knew what I should say to him."

"I knew," said Patience.

"I am sure that Clary knew," said Mary. "But he is all alone there, and will not know what to do with himself. Won't you go to him?"

"You will go up to Clary?" Mary nodded her head, and then Patience crossed the hall to liberate the rejected suitor. Mary stood for a while thinking. She already knew, from what Patience had said, that Clarissa had suspected her, and she felt that there should have been no such suspicion. Clarissa had not understood, but ought to have understood. For a moment she was angry, and was disposed to go to her own room. Then she remembered all her cousin's misery, and crept up-stairs to the door. She had come so softly, that, though the door was hardly closed, nothing had been heard of her approach. "May I come in, dear?" she said, very gently.

"Well, Mary; tell me all," said Clarissa.

"There is nothing to tell, Clary—only this, that I fear Mr. Newton is not worthy of your love."

"He asked you to take him?"

"Never mind, dearest. We will not talk

of that. Dear, dearest Clary, if I only could make you happy."

"But you have refused him?"

"Don't you know me better than to ask me? Don't you know where my heart is? We will carry our burdens together, dearest, and then they will be lighter."

"But he will come to you again—that other one."

"Clary, dear; we will not think about it. There are things which should not be thought of. We will not talk of it, but we will love each other so dearly." Clarissa, now that she was assured that her evil fortune was not to be aggravated by any injury done to her by her cousin, allowed herself to be tranquillized if not comforted. There was indeed something in her position that did not admit of comfort. All the family knew the story of her unrequited love, and treated her with a compassion which, while its tenderness was pleasant to her, was still in itself an injury. A vain attachment in a woman's heart must ever be a weary load, because she can take no step of her own toward that consummation by which the burden may be converted into a joy. A man may be active, may press his suit even a tenth time, may do something toward achieving success. A woman can only be still and endure. But Clarissa had so managed her affairs that even that privilege of being still was hardly left to her. Her trouble was known to them all. She doubted whether even the servants in the house did not know the cause of her woe. How all this had come to pass she could not now remember. She had told Patience—as though in compliance with some compact that each should ever tell the other all things. And then circumstances had arisen which made it so natural that she should be open and candid with Mary. The two Ralphs were to be their two lovers. That to her had been a delightful dream during the last few months. He, whose inheritance at that moment was supposed to have been gone, had, as Clarissa thought, in plainest language told his love to her. "Dear, dear Clary, you know I love you." The words to her sense had been so all-important, had meant so much, had seemed to be so final, that they hardly wanted further corroboration. Then, indeed, had come the great fault—the fault which she had doubted whether she could ever pardon; and she, because of the heinousness of that offence, had been unable to answer the question that had been asked. But the offence, such as it was, had not lightened the solemnity of her assurance, as far as love went, that Ralph ought to be her own after the speaking of such words as he had spoken. There were those troubles about money, but yet she was entitled to regard him as her own. Then had come the written offer from the other Ralph to Mary—the offer written in the moment of his believed prosperity; and it had been so natural that Clarissa should tell her cousin that as regarded the splendor of position there should be no jealousy between them. Clarissa did not herself think much of a lover who wrote

letters instead of coming and speaking—had perhaps an idea that open speech, even though offence might follow, was better than formal letters; but all that was Mary's affair. This very respectful Ralph was Mary's lover, and, if Mary were satisfied, she would not quarrel with the well-behaved young man. She would not even quarrel with him because he was taking from her own Ralph the inheritance which for so many years had been believed to be his own. Thus in the plenitude of her affection and in the serenity of her heart she had told every thing to her cousin. And now also her father knew it all. How this had come to pass she did not think to inquire. She suspected no harm from Patience. The thing had been so clear, that all the world might see it. Ralph, that false one, knew it also. Who could know it so well as he did? Had not those very words been spoken by him—been repeated by him? Now she was as one stricken, where wounds could not be hidden.

On that day Ralph was driven back to town in his cab, in a rather disheartened condition, and no more was seen or heard of him for the present at Popham Villa. His late guardian had behaved very ill to him in telling Mary Bonner the story of Polly Neeft. That was his impression—feeling sure that Mary had alluded to the unfortunate affair with the breeches-maker's daughter, of which she could have heard tidings only from Sir Thomas. As to Clarissa, he had not exactly forgotten the little affair on the lawn; but to his eyes that affair had been so small as to be almost overlooked amid larger matters. Mary, he thought, had never looked so beautiful as she had done while refusing him. He did not mean to give her up. Her heart, she had told him, was not her own. He thought he had read of young ladies in similar conditions, of young ladies who had bestowed their hearts and had afterward got them back again for the sake of making second bestowals. He was not sure but that such an object would lend a zest to life. There was his brother Gregory in love with Clarissa, and still true to her. He would be true to Mary, and would see whether, in spite of that far-away lover, he might not be more successful than his brother. At any rate he would not give her up—and before he had gone to bed that night he had already concocted a letter to her in his brain, explaining the whole of that Neeft affair, and asking her whether a man should be condemned to misery for life because he had been led by misfortune into such a mistake as that. He dined very well at his club, and on the following morning went down to the Moonbeam by an early train, for that day's hunting. Thence he returned to Newton Priory in time for Christmas, and as he was driven up to his own house, through his own park, meeting one or two of his own tenants, and encountering now and then his own obsequious laborers, he was not an unhappy man in spite of Mary Bonner's cruel answer. It may be doubted whether his greatest trouble at this moment did not arise from his dread of Neeft. He

had managed to stay long enough in London to give orders that Neeft's money should be immediately paid. He knew that Neeft could not harm him at law; but it would not be agreeable if the old man were to go about the country telling every one that he, Ralph Newton of Newton, had twice offered to marry Polly. For the present we will leave him, although he is our hero, and will return to the girls at Popham Villa.

"It is all very well talking, Patience, but I don't mean to try to change," Clarissa said. This was after that visit of the Percycross deputation to Sir Thomas, and after Christmas. More than a week had now passed by since Ralph had rushed down to Fulham with his offer, and the new year had commenced. Sir Thomas had been at home for Christmas—for the one day—and had then returned to London. He had seen his attorney respecting the petition, who was again to see Mr. Griffenbottom's London attorney, and Mr. Trigger. In the mean time Sir Thomas was to remain quiet for a few days. The petition was not to be tried till the end of February, and there was still time for deliberation. Sir Thomas just now very often took out that great heap of Baconian papers, but still not a word of the biography was written. He was, alas! still very far from writing the first word. "It is all very well, Patience, but I do not mean to try to change," said Clarissa.

Poor Patience could make no answer, dreadful as was to her such an assertion from a young woman. "There is a man who clearly does not want to marry you, who has declared in the plainest way that he does want to marry some one else, who has grossly deceived you, and who never means to think of you again; and yet you say that you will wilfully adhere to your regard for him!" Such would have been the speech which Patience would have made, had she openly expressed her thoughts. But Clarissa was ill, and weak, and wretched; and Patience could not bring herself to say a word that should distress her sister.

"If he came to me to-morrow, of course I should forgive him," Clarissa said again. These conversations were never commenced by Patience, who would have rather omitted any mention of that base young man. "Of course I should. Men do those things. Men are not like women. They do all manner of things, and everybody forgives them. I don't say any thing about hoping. I don't hope for any thing. I am not happy enough to hope. I shouldn't care if I knew I were going to die to-morrow. But there can be no change. If you want me to be a hypocrite, Patience, I will; but what will be the use? The truth will be the same."

The two girls let her have her way, never contradicted her, coaxed her, and tried to comfort her—but it was in vain. At first she would not go out of the house, not even to church, and then she took to lying in bed. This lasted into the middle of January, and still Sir Thomas did not come home. He wrote frequently, short notes to Patience,

sending money, making excuses, making promises, always expressing some word of hatred or disgust as to Percycross; but still he did not come. At last, when Clarissa declared that she preferred lying in bed to getting up, Patience went up to London and fetched her father home. It had gone so far with Sir Thomas now that he was unable even to attempt to defend himself. He humbly said he was sorry that he had been away so long, and returned with Patience to the villa.

"My dear," said Sir Thomas, seating himself by Clarissa's bedside, "this is very bad."

"If I had known you were coming, papa, I would have got up."

"If you are not well, perhaps you are better here, dear."

"I don't think I am quite well, papa."

"What is it, my love?" Clarissa looked at him out of her large tear-laden eyes, but said nothing. "Patience says that you are not happy."

"I don't know that anybody is happy, papa."

"I wish that you were, with all my heart, my child. Can your father do any thing that will make you happy?"

"No, papa."

"Tell me, Clary. You do not mind my asking you questions?"

"No, papa."

"Patience tells me that you are still thinking of Ralph Newton."

"Of course I think of him."

"I think of him too—but there are different ways of thinking. We have known him, all of us, a long time."

"Yes, papa."

"I wish with all my heart that we had never seen him. He is not worthy of our solicitude."

"You always liked him. I have heard you say you loved him dearly."

"I have said so, and I did love him. In a certain way I love him still."

"So do I, papa."

"But I know him to be unworthy. Even if he had come here to offer you his hand I doubt whether I could have permitted an engagement. Do you know that within the last two months he has twice offered to marry another young woman, and I doubt whether he is not at this moment engaged to her?"

"Another?" said poor Clarissa.

"Yes, and that without a pretence of affection on his part, simply because he wanted to get money from her father."

"Are you sure, papa?" asked Clarissa, who was not prepared to believe, and did not believe this enormity on the part of the man she loved.

"I am quite sure. The father came to me

to complain of him, and I had the confession from Ralph's own lips, the very day that he came here with his insulting offer to Mary Bonner."

"Did you tell Mary?"

"No. I knew that it was unnecessary. There was no danger as to Mary. And who do you think this girl was? The daughter of a tailor who had made some money. It was not that he cared for her, Clary—no more than I do! Whether he meant to marry her or not I do not know."

"I'm sure he didn't, papa," said Clarissa, getting up in bed.

"And will that make it better? All that he wanted was the tradesman's money, and to get that he was willing either to deceive the girl, or to sell himself to her. I don't know which would have been the baser mode of traffic. Is that the conduct of a gentleman, Clary?"

Poor Clarissa was in terrible trouble. She hardly believed the story, which seemed to tell her of a degree of villany greater than ever her imagination had depicted to her—and yet, if it were true, she would be driven to look for means of excusing it. The story as told was indeed hardly just to Ralph, who in the course of his transactions with Mr. Neeft had almost taught himself to believe that he could love Polly very well; but it was not in this direction that Clarissa looked for an apology for such conduct. "They say that men do all manner of things," she said, at last.

"I can only tell you this," said Sir Thomas, very gravely. "What men may do I will not say; but no gentleman can ever have acted after this fashion. He has shown himself to be a scoundrel."

"Papa, papa! don't say that," screamed Clarissa.

"My child, I can only tell you the truth. I know it is hard to bear. I would save you if I could; but it is better that you should know."

"Will he always be bad, papa?"

"Who can say, my dear? God forbid that I should be too severe upon him! But he has been so bad now that I am bound to tell you that you should drive him from your thoughts. When he told me, all smiling, that he had come down here to ask your cousin Mary to be his wife, I was almost minded to spurn him from the door. He can have no feeling himself of true attachment, and cannot know what it means in others. He is heartless—and unprincipled."

"Oh, papa, spare him. It is done now."

"And you will forget him, dearest?"

"I will try, papa. But I think that I shall die. I would rather die. What is the good of living when nobody is to care for anybody, and people are so bad as that?"

"My Clarissa must not say that nobody cares for her. Has any person ever been false to you but he? Is not your sister true to you?"

"Yes, papa."

"And Mary?"

"Yes, papa." He was afraid to ask her whether he also had not been true to her? Even in that moment there arose in his mind a doubt, whether all this evil might not have been avoided, had he contented himself to live beneath the same roof with his children. He said nothing of himself, but she supplied the want. "I know you love me, papa, and have always been good to me. I did not mean that. But I never cared for any one but him—in that way."

Sir Thomas, in dealing with the character of his late ward, had been somewhat too severe. It is difficult, perhaps, to say what amount of misconduct does constitute a scoundrel, or justifies the critic in saying that this or that man is not a gentleman. There be those who affirm that he who owes a debt for goods which he cannot pay is no gentleman, and tradesmen when they cannot get their money are no doubt sometimes inclined to hold that opinion. But the opinion is changed when the money comes at last—especially, if it comes with interest. Ralph had never owed a shilling which he did not intend to pay, and had not property to cover. That borrowing of money from Mr. Neeft was doubtless bad. No one would like to know that his son had borrowed money from his tailor. But it is the borrowing of the money that is bad, rather than the special dealing with the tradesman. And as to that affair with Polly, some excuse may be made. He had meant to be honest to Neeft, and he had meant to be true to Neeft's daughter. Even Sir Thomas, high-minded as he was, would hardly have passed so severe a sentence, had not the great sufferer in the matter been his own daughter.

But the words that he spoke were doubtless salutary to poor Clarissa. She never again said to Patience that she would not try to make a change, nor did she ever again declare that if Ralph came back again she would forgive him. On the day after the scene with her father she was up again, and she made an effort to employ herself about the house. On the next Sunday she went to church, and then they all knew that she was making the necessary struggle. Ralph's name was never mentioned, nor for a time was any allusion made to the family of the Newtons. "The worst of it, I think, is over," said Patience one day to Mary.

"The worst of it is over," said Mary; "but it is not all over. It is hard to forget when one has loved."

APPLETONS' JOURNAL

LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 96.—VOL. V.]

SATURDAY, JANUARY 28, 1871.

[PRICE TEN CENTS.]

PICTURESQUE AMERICA.

WITH ILLUSTRATIONS BY HARRY FENN.

A VISIT TO MAUCH CHUNK.

MAUCH CHUNK is the most picturesque town in the Union. Scarcely is this sentence written, however, when the claims of hundreds of other villages and cities appall the writer with threats of prolonged discussions, and hence, that he may be entirely safe in what he utters, let the sentence be amended so as to declare that it is one of the most picturesque towns in the Union. No one who has ever visited Mauch Chunk, and no one who will study Mr. Fenn's graphic drawings, can gainsay this much at least. But where is Mauch Chunk? and wherefore Mauch Chunk? Mauch Chunk is within the heart of the mountain-region known as

not in North Carolina. There is, in fact, not a mountain-region in the country, with which the writer is acquainted, that is not proudly called by all its admirers the "Switzerland of America;" so, to place Mauch Chunk under such a general designation, is to give the quaint little town a dozen local habitations in men's imaginations at once.

To put the reader out of further anxiety, let me say that Mauch Chunk is in the very heart of the Pennsylvania coal-region. Its name, in the original Indian language from which it is derived, means "Bear Mountain." It lies in a narrow gorge between and among high hills, its foot, as it were, resting on the picturesque little Lehigh River, and its body stretching up the clefts

MAUCH CHUNK—CANAL-BOATS RECEIVING COAL.

the "Switzerland of America." No, my excellent friend from Maine, it is not upon your beautiful Mount-Desert Island. Be assured, my dear sir, it is not in New Hampshire. Nor is it among the Berkshire hills. Nor do the regions of the Catskills know it. Nor is it, my confident sir, among the Alleghanies. The "Switzerland of America" is, of course, among the mountains of North Carolina, and yet Mauch Chunk is

of the mountains. It is so compacted among the hills that its houses impinge upon its one narrow street, and stand backed up against the rising ground, with no space for gardens except what the owners can manage to snatch from the hill-side above their heads. As proof of what can be done in a narrow space, this quaint and really Swiss-like village affords a capital example. In one portion, just

where the turbulent Lehigh sweeps around, as if to give the town a salute, and then rushes merrily off again, one sees the river, a canal, two railways, a road, and a street, packed in a space scarcely more than a stone's-throw wide—all of which the reader can note, without stirring from his easy-chair, by a glance at Mr. Fenn's larger drawings.

There is a great deal in knowing how to find the picturesque, and Mr. Fenn, in his large views (see page 108, and page 109), has selected points of view that present the hills and the town in their best aspect. The first of these views is taken from the road that runs along the side of the high hill just below the town. In the second illustration, one can discern the road, faintly marked, ascending obliquely the distant hill. From this road the view gives just a glimpse of the receding town to the left; shows in the distance Mount Pisgah, which is not a volcano, notwithstanding the smoke that seems to issue from its apex; and gathers at the feet of the spectator hurrying river, busy canal, railways, and highway, as they lie crowded between the steep hills. Here there is always the stir of a great traffic. Ceaselessly day and night the long, black coal-trains come winding round the base of the hills, like so many huge anacondas, often with both head and tail lost to the eye, the locomotive reaching out of sight before the last car comes swinging around the curve. These trains are of marvellous length, sometimes, when returning empty, numbering over two hundred cars. So continuous is their coming and going, sweeping now around the foot of the hill opposite, and now around the base of the hill on which we stand, that usually several trains are visible at the same time; and rarely at any moment is the whistle or the puff of the locomotive silent. The writer's curiosity prompted him to keep a record of passing trains for an hour, and he found they averaged one in every two minutes. These trains are almost exclusively employed in freighting coal; and this immense traffic in black diamonds becomes still more surprising when it is remembered that, in addition to the trains, canal-boats similarly freighted ceaselessly pass the town with the regularity, order, and succession of a procession. It is a relief to have recourse to figures, and to learn that one of the railways alone ships eighteen thousand tons of coal weekly. Treble this, and the aggregate is probably approximated. Up here on the hill-side the scene before us is certainly novel and picturesque. We may watch the stirring traffic, the quiet canal, the swift Lehigh—sometimes only the small thread of a river barely covering its rocky bed, but occasionally a roaring flood bringing ruins upon its surface and carrying ruin before it—or we may study the tints and forms of the receding hills, or note a singular locomotion far up on the sides of the distant Mount Pisgah.

On the highest part of this mountain, as the reader will observe in Mr. Fenn's illustration, are two tall chimneys, ascending to which is the line of a railway. The chimneys and the building there to give note

of a stationary engine at this crowning apex of the height, and the line up the mountain-side shows us where the famous Mount Pisgah inclined plane ascends to its top. The line crossing the hill half-way down, and just below Upper Mauch Chunk, marks the course of the Gravity Railway, one of the marvels of the place. If the reader pleases, we will descend our mountain-highway, picturesque and beautiful every step of it, with beetling cliffs above and precipitous reaches below, and prepare for an odd sort of journey to the top of Mount Pisgah, and, by the Gravity Road, to the coal-mines beyond. But, before we proceed, let us understand where we are going and what we shall see a little better by consulting a brief page of history and a few facts of description.

The mines which supply the principal traffic of Mauch Chunk are situated nine miles back from the river, on Sharp and Black Mountains, and in Panther-Creek Valley, lying between. The first anthracite coal was discovered on Sharp Mountain, sometimes known as Summit Hill, by a hunter named Ginter, in 1791. The hard anthracite, however, was at first called "black-stone," and its combustible quality denied. Experiments with it were made in Philadelphia, and it was gravely asserted that this hard, rocky substance, which resembled coal, only served to put the fire out! Experiments, however, at a later date, must have satisfied those concerned that anthracite coal, if slower to ignite than bituminous, yet possessed decided combustible qualities, for companies were formed to work the mines on Sharp Mountain. It was not, however, until 1820 that shipments became at all regular or noteworthy. Coal was brought from the mines, slowly and wearisomely, by wagons, until 1827, when a track was constructed, with a falling grade, from Summit Hill to the Lehigh, by which cars were run down by their own gravity—hence the name Gravity Road. The cars were drawn back by mules, which, of course, had to be sent down on cars with each train. This method continued for a long time; but the traffic at last so increased that a more expeditious return of the cars to the mines was needed, and in 1844

the plan of a back-track was arranged. An inclined plane was laid to the top of Mount Pisgah, up which the empty cars were elevated by

MOUNT-PISGAH INCLINED PLANE.

Diagram of Switchback Road.

means of a stationary engine; the track, then, by a downward grade, the cars moving by force of their own weight, reached the foot of Mount

Jefferson, up which they ascended by another plane—the power a stationary engine—and then, by another downward grade, reached Summit Hill. From Summit Hill the cars descended to the mines in the Valley, by what was called the Switch-back, a term now often given to the entire road, but which at present has no correct application to any part of it. The Switch-back was a means of descending the side of the mountain, as seen in the diagram on the opposite page.

The cars ran rapidly down the track which in our diagram we mark No. 1, until, reaching its extreme limit, it encountered an abrupt hillock, up which it rushed until arrested by a reversal of its gravity; here, by a self-regulating arrangement, it was switched on to the track marked, in the diagram, 2, down which it instantly began to rush with break-neck speed. At the extremity of this track the operation was repeated, the car switched on track marked 3, and again it dashed along the road, often attaining the speed of sixty miles an hour. This is all changed now, the cars reaching the valley by longer but continuous lines. The cars returned to Summit Hill by means of inclined planes and stationary engines, in which there has been no change. In the first of our larger illustrations, the Mount-Pisgah inclined plane and a portion of the Gravity Road, as already mentioned, may be seen. The cars which we observe on the grade may be discovered at their terminus in the engraving on our first page. Here they rattle down into huge coal-boxes, where their contents are dumped and shot into the waiting canal-boats, which are always gathered here by hundreds in picturesque confusion.

After this brief glance at the origin and use of this singular road, we may undertake with greater satisfaction a jaunt over its long circuit of twenty-five miles.

An omnibus, at stated hours, conveys the curious passengers from the "Mansion House" to the foot of the inclined plane. It rattles through the town's single street, diverges into the road that ascends the hill, and, after a journey that the impatient traveller imagines must have already gotten him to the top, draws up at the foot of the famous plane, which, if our description has not adequately depicted to the mind's-eye of the reader, an accompanying illustration will bring before him accurately and clearly. It may be mentioned here that the length of this plane is twenty-three hundred and twenty-two feet, and its elevation six hundred and sixty-four feet. At its foot we find a very small passenger-car—a diminutive, undergrown little ve-

hicle, designed to hold ten passengers—in which we may enter. The plane appears, when standing at its foot, to reach almost perpendicularly up into the air; and when at last the ascent begins, one feels as if he were drawn up into the clouds, and naturally commences to speculate with what terrible swiftness the car would shoot down

the plane, if it should get loose. The little hand-book for travellers, however, which every inquiring and right-minded passenger is sure to possess, gives assurance that this is impossible. Behind the miniature carriage is what is called a safety-car. From this car extends an arm over a ratchet-rail, laid between the tracks. Should an accident occur either to the car or to the gearing, this arm, the moment a downward movement begins, inevitably falls into the notch of the ratchet-rail, and, being too strong to break, the train is at once brought to a stand-still. It is frightful-looking, notwithstanding this assurance, and one discovers that his imagination takes a strange pleasure in depicting the terrible whirl through space and the horrible splintering upon the rocks, should it please Fate to give the pleasure-trip a tragical turn. As the car ascends, the view enlarges; and, when the height is reached, a splendid prospect opens to the delighted visitor.

What follows may now easily be conceived, by means of the descriptions of the road already given. The car runs easily and swiftly along, without other force than its own weight, the road being through beautiful woodland-scenery. As we draw near the mines, large villages appear, occupied principally by the miners, and at Summit Hill is a hotel, church, and other evidences of civilization. The huge buildings, called coal-breakers, at the mouths of the mines, form new, striking, and picturesque objects, and immense piles of *debris*, accumulated in excavating for the black wealth below, look like small mountains. Near abandoned mines, these vast heaps give indications of a new soil gathering on their surface. Bushes and small evergreen trees have already managed to find sufficient nurture, amid the slate and coal-dust, for their roots. The leaves from these growths will add soil to the surface, and in time there can be no doubt that, what are now unsightly masses of *debris*, will be covered with grass and trees, afford-

MAUCH CHUNK HIGHWAY.

ing possibly a new puzzle for the geologist of a thousand years hence.

The circuit completed, we leave the car well up the hill, and descend the mountain-road to the village. The roofs show far down below us among the trees, and the houses, huddled close by the

hills, are grouped in most picturesque form. It is the most novel and striking approach to a town that can be imagined. As we near the houses they seem so directly beneath that we wonder if a slip would not precipitate us down a chimney, or impale us on a steeple. The second of our larger illustrations shows the scene as we near the town from this approach. There is a church-roof below the point of view, and a row of houses in the middle ground on the hill-side, and a new, picturesque church, set up by the architect just where it would add most to the beauty and effectiveness of the picture.

The street-scenes in Mauch Chunk are quaint enough. They are literally highways. As there is no room for gardens or out-buildings back of the houses, they are built up above them, and are reached by ladders. It is not uncommon, in the ruder parts of the town, to see a pigsty, up above the house-top, reached by a ladder; another ladder extending above this to a potato or cabbage patch, and another leading to the family oven, presiding over the strange group with suitable honor and dignity.

There can be no more pleasing short pleasure-trip than to Mauch Chunk. It is reached in five hours from New York by the New-York Central, in connection with the Lehigh and Susquehanna Railway, or by the Delaware and Lackawanna road, in connection with the Lehigh Valley. The former route has through-trains. A visit to Mauch Chunk makes a pleasant summer-trip; but in October, when all the superb hills that encircle the quaint town are in the full glow of their autumn tints, the innumerable mountain-excursions that then may be taken, which, in summer, would be too fatiguing, enhance greatly the pleasure of the visit.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER IV.

MYRRHA, coming down to breakfast next morning, in the most charming of morning dresses, announced that she felt "Quite settled now, Aunt Daisy, quite at home." To prove which she insisted upon taking Daisy's place at the table, "to save Aunt Daisy trouble."

"You'll find me very useful, Aunt Daisy, in ever so many ways! Though, seeing me so ornamental, I don't suppose you expect it!"

After breakfast she said the flowers in the vases were faded, and she would pick others. "Arranging flowers is one of the accomplishments on which I pride myself, Aunt Daisy."

When this was finished—it occupied some time, and was done with much fuss, and many flittings in and out, and to and fro—she audibly wondered how soon Mr. Stewart would fulfil his promise about bringing her a horse; this reminded her to go and look up all the et ceteras of riding-costume—hat, gloves, cravat, and whip.

She soon reappeared, laden with music. "Is your piano in good tune, Aunt Daisy?"

"I hardly know, dear."

"I conclude Mr. Stewart is a Scotchman, Aunt Daisy, so I've been hunting out all my Scotch songs—preparing to fascinate him by singing them. Is he fond of music, Aunt Daisy? Does he ever come here of an evening? Does he like vocal or instrumental music best? What style of music, classical or romantic? Do you play and sing, Aunt Daisy?"

"Which of your questions shall I answer first?"

"You think me a sad rattle, don't you, Aunt Daisy? But you'll soon get to like my rattle. I'm always the life and light of any house I'm in. At home you see, Aunt Daisy, I was too bright a light. I threw Jean and Julia, poor old dears, so grievously into the shade."

Trying the piano, she pronounced it very tolerable, but got up from it almost immediately.

"I think I shall go out and make a sketch of the cottage. I'm very fond of sketching, and, I think I may say, I'm rather clever at it. Perhaps, after lunch, you'll take me for a good long walk. I suppose it is no use hoping that Mr. Stewart will take me for a ride this first day, is it, Aunt Daisy?"

"Of course it is just possible, but not probable. Most likely the horse he intends for your riding will require some exercising first."

"I can ride any thing, Aunt Daisy, so I hope he won't reduce the animal to an uninteresting state of quietness."

Myrrha arranged herself in something she called a hat, and in a coquettish jacket, and then went out "to sketch." So Daisy, who

found that continual repetition of "Aunt Daisy" somewhat trying to her unaccustomed nerves, had quiet breathing-time.

After lunch, which was in reality dinner, Daisy took her visitor for a walk. She found that "a walk" with Myrrha meant no mere stroll of a mile or so, but two or three hours of good, brisk, uninterrupted walking—"over the hills and far away." Not exactly, however, on Myrrha's part, uninterrupted, as she broke the monotony of walking by running races with Daisy's large dog. Daisy had no idea she could have borne such a walk. The truth was she was amused, distracted from the consciousness of the weight and burden of her own existence. The contact with Myrrha's frivolity, exuberant youth, and gay superficiality, did her good. When they came home they took a cup of tea, then Daisy went to lie down in her own room, and Myrrha went "to dress."

"I wonder if I shall be able to get fond of her," Daisy thought. "She is so pretty, but—the pretty eyes are so untrustworthy. I wonder how Kenneth will like her? I should think he won't be able to help admiring her! The miniature he spoke of so warmly couldn't represent a lovelier face than Myrrha's." And here Daisy sighed.

"I like your way of living, uncommonly, Aunt Daisy," was Myrrha's comment on the delicately-appointed tea-table to which they sat down about seven o'clock. "I suppose it wouldn't suit a man, they always seem bent on late dinners," she went on. "I suppose Mr. Stewart dines late. I forget if you said he did come sometimes in the evening? I am longing to see him again. Perhaps he may look in this evening, just to tell me when I may expect a ride?"

"It is quite possible he may."

But he did not. Myrrha's spirits drooped: she seemed to find the evening dull, and she went to bed very early, regretting that she had been to the trouble of putting on one of her prettiest dresses.

The next day was wet, and Myrrha felt it hang on hand somewhat heavily: she spread some of her pretty "costumes" out in her room for the admiration of Daisy, of Mrs. Moss, and of Jane, but this was not very exciting. The day dragged.

When Mr. Stewart, in spite of the rain, came to the cottage that evening, Myrrha's reception of him showed him that he was a most welcome apparition.

"Is this intended in an offensive sense?" he asked, when Myrrha crossed the room to him, carrying him a cup of tea. "I ask, because this is the sort of attention paid by charming young ladies to elderly bachelor uncles."

"You enlighten me, Mr. Stewart. I didn't know, though I may have fancied, I had that happiness to hope for—of having you for my uncle. When is it to be?"

"You are a saucy-tongued young lady! And your sauciness was not apt. If I had meant any such allusion, should I have used the word 'offensive'?"

He turned to the open, music-littered piano.

"You are prepared to entertain me, I see, and I am prepared to be entertained."

"Do you really like music?"

"I really like music; but then I may have ideas of my own as to what I call music."

"Oh, I shall be sure to be able to find something to please you; for I do a little in all styles: so I will try you with a variety." She played first a weird valse by Chopin; she rattled it off brilliantly, with very creditable, though not flawless, execution.

"I know beforehand that that is neither your style nor Aunt Daisy's, Mr. Stewart," Myrrha said, as she twirled herself round on the music-stool to investigate her auditors.

"It is a good beginning, at all events, Miss Brown; it gives us an opportunity of judging the mechanical part of your talent."

"Dear me! you'll make me nervous! If I think I am to be listened to in such a judicial and critical spirit, I sha'n't do myself half justice."

"Do you, then, prefer ignorant applause to enlightened criticism?"

"I don't see why you should take for granted that the applause can only come from the ignorant, and from the enlightened only criticism! Well, I'm going now to play you something in quite a different style."

She played a sonata of Mozart's; when she ended, she turned to look at Mr. Stewart, prepared to receive his compliments triumphantly. Mr. Stewart gravely shook his head.

"What does that mean, Mr. Stewart?" Myrrha asked, with wondering eyes.

"Am I to speak frankly, Miss Brown?"

"Of course." But already the tone was pettish and the face cloudy.

"I think that performance was a signal failure. It seems to me you fail entirely in catching and rendering the Mozartism of Mozart, the tender grace, the—"

"Oh, pardon!" exclaimed Myrrha, elevating her pretty brows. "I had no notion I was playing to an enthusiast. To tell the truth, I don't so much care about 'understanding' a composer. I like to make his music say what I please, not just slavishly to say what he pleases."

"Then, of course, you set yourself beyond the pale of criticism. But you should have prepared us beforehand for what was coming; should have told us that we were not going to listen to Mozart played by Miss Brown, but to Miss Brown through Mozart."

Myrrha eyed Mr. Stewart somewhat long and largely.

"I shan't play to you any more to-night. I shall try if my singing suits you better."

She sang half a dozen of what she considered her best songs, one after the other, in rapid succession, giving no time for criticism, and feeling confident that now, at last, she was dazzling her listeners.

There was something so frank in the way her face expressed that confidence, when she ceased and turned round, that Mr. Stewart, both touched and amused, gave her all the praise he could honestly bestow. He praised the possibilities of her voice, which was a fine contralto, and remarked that, with diligent study and good instruction, he thought she would, one day, sing very finely.

"Diligent study! good instruction!" Myrrha echoed, amazedly.

"Why, I've practised ever so many hours a day, for ever so many years, and I've had lessons from a prima donna! It must be that this room is so wretchedly low for singing—then, the piano is out of tune, and I think I've got a slight cold. But, Mr. Stewart," she demanded, after a sullen pause, "what can make you think I want good instruction?"

"Well, it seemed to me that you had not mastered the very elements of good singing—did not know how properly to bring out your true voice."

"Are you a music-master?" Myrrha asked, rudely. "Perhaps you will give me the 'good instruction' of which you think I am so much in need?"

"I fear I must not have that honor."

After that answer, Mr. Stewart talked entirely to Daisy.

Myrrha, drooping her pretty head dejectedly, threw herself on a sofa: there she sat, sullen and silent, for perhaps a quarter of an hour; then got up, and said, "Good-night!"

Mr. Stewart lighted her candle; as he held it to her, he brightened her whole being again, by asking at what time to-morrow she would like to ride, should the day be fine, as he thought it promised to be.

"That's the cleverest way of winning my forgiveness," she said.

"But, Mr. Stewart, if you don't like my riding any better than you like my playing, my singing, and, perhaps, I may add, myself—"

"Any one light and graceful as you are, and, I should say, with plenty of the rash courage of ignorance, can't help riding well."

"Thank you for nothing, Mr. Stewart," she answered, dropping him a deep courtesy.

"Did Mr. Stewart stay long after I went to bed?" Myrrha asked, next morning, with assumed carelessness.

"About five minutes."

"Aunt Daisy, if you think the question impertinent, I hope you'll forgive me for asking it—are you engaged to Mr. Stewart?"

"No, Myrrha." Poor Daisy blushed painfully.

"You seem so very intimate, and he seems so perfectly at home in your house, it was a natural question to ask, Aunt Daisy."

"We are very old friends."

"I conclude he hasn't a wife, or he wouldn't be so free to come and go."

"He has no wife."

"Is he a widower?"

"I have never heard of his having married."

"And he is not your lover, only your friend, you think?"

To this Daisy made no answer; she thought the girl impertinent.

But Myrrha had not done, and was not to be repressed by Daisy's grave silence.

"Aunt Daisy, he is more than your friend." She spoke with her worldly-wise look. "Indeed, I do believe there is no such thing as 'only friendship' possible between an unmarried man and an unmarried woman. And, indeed, why should there be only friendship? Why, for instance, should you two, who are such good friends, not marry? Possibly Mr. Stewart is not quite as good a match as you once hoped to make, Aunt Daisy; but we don't keep young forever. When I am as old as you are, if I am still single, I shall seriously set about getting married."

"I do not think of marrying," answered Daisy, coldly.

"And does Mr. Stewart also not think of marrying?"

"You must question him on that head yourself, if your audacity is equal to it."

"I will, perhaps, by-and-by, when I know him a little better. This morning I am going to question him about my drawing. I think he will admit I have talent for that."

When Mr. Stewart came, Myrrha, most prettily got up in a riding dress, was in the garden, touching up a sketch of the cottage she had made the day before yesterday.

"I think I have taken it from the best point of view, Mr. Stewart. Don't you think so?" she asked, with winning humility. "Now, tell me what you really think."

He had tied his own horse to the garden-gate, and ordered the other to be led up and down. He took her sketching-block in his hands.

"Do you, Miss Brown, really wish to know what I really think? You said so about your music, and yet I had the misfortune to offend you."

"Of course I do!" she pouted.

"The point of view is not a bad one, but the drawing is bad." Then he went on to show her, bit by bit, how every thing was wrong, light and shade, perspective, every thing; ending by saying, "I should think you have some facility, but you have had no teaching, or worse than none. You are hasty, superficial, consequently untruthful."

"Mr. Stewart, what a terrible pedant you are! I am wondering," she said, looking into his face with an audacious look, not free from spite, "whether you have been longest a music-master or a drawing-master. I am sure you must have been both."

At that moment the perfectly-appointed and handsome mare intended for her riding came in sight. This changed her mood; she could not afford to quarrel with the provider of such pleasure as she promised herself from these rides; so she looked up into his face again, this time with a look meant to be bewitchingly sweet, and asked:

"At any rate, will you be my master?"

"We will see what can be done for you. If I were your father, or guardian, I would certainly take care that you had a couple of years' thorough teaching."

"I have no father, you see, and no guardian. If you will be so good as to help me—"

"We will see, we will see. Where is your aunt?" His eyes had been scanning the windows.

"I don't know."

"I will go and find her. I have a word to say to her before we start."

"I dare say you have," muttered Myrrha, looking after him displeasedly. "To be neglected for an old maid like Aunt Daisy! I suppose she has money. Heigho! What would I not give to be rich!"

Mr. Stewart thought Daisy looking worried.

"Are you tired of her? Does she weary you?"

"I ought not to mind. She is very good-natured."

"When she is pleased."

"She certainly has the womanly virtue of wishing to please."

"It is a virtue in a woman to wish to please those worth pleasing."

"I suppose some women think everybody worth pleasing?"

"Every man," corrected Mr. Stewart. "And that is nearer vice than virtue, in my eyes."

Daisy walked with him to the gate, and there they found Myrrha, leaning against the paling, engaged in easy and laughing conversation

with the groom. Mr. Stewart gave an amused and annoyed glance at Daisy.

The riders were so long absent that Daisy grew anxious.

Myrrha had boasted that she could ride any thing, but Daisy had already known her long enough not to pay much attention to her statements. When, at last, she heard the sound of horses' feet, she went hurriedly to the gate.

"Mr. Stewart is afraid you will have been alarmed, Aunt Daisy. I hope he is wrong. We have had the most delicious ride. Mr. Stewart is a darling to get me such a delightful horse. I shall love him forever, as the children say!"

"Nothing has gone wrong, then?"

"Not with us," Mr. Stewart, gazing into the grave, pale face, answered.

Myrrha was looking radiant, and, in a certain way, as lovely as a creature could look.

"I needn't ask if you are tired, Myrrha?" Daisy said.

"Tired! No, Aunt Daisy." And, as Mr. Stewart lifted her to the ground, she looked more than half-inclined to kiss him in the exuberance of her spirits. "He says he will stay for our tea instead of going home to dinner, if you will let him, Aunt Daisy. I'll run in and dress directly, for, in spite of the lunch we had, I'm very hungry."

Daisy stayed in the garden with Mr. Stewart till Myrrha joined them.

"Tea is quite ready, and every thing looks so nice. And don't I look nice, too, Aunt Daisy?"

The question of the tongue was for Aunt Daisy; the question of the eyes for Mr. Stewart.

"Indeed you do, dear! But is it safe for you, Myrrha, warm from your ride, to come out-doors so lightly dressed? It is not summer yet."

"But it is as warm as summer, Aunt Daisy."

She was, openly and undisguisedly, standing to be admired. The frankness of her vanity gave it a kind of charm, making it seem childlike and innocent. She looked much more than pretty: a most bright creature, and of a most delicate brightness. She held a perfect rose-bud in her hand.

"Mr. Stewart," she said, "in grateful recognition of the pleasures of the ride past, and grateful anticipations of rides to be, I forgive you the many hard raps on the knuckles you've given me. I offer you this," holding the rose-bud to him, "as a flag of truce."

"I will do your gift the highest honor in my power, Miss Brown." He took it from Myrrha—and gave it to Daisy.

In a moment the glee darkened out of Myrrha's eyes, but only for a moment. Exhilarated by her ride, she was in spirits too high to let sullenness be possible.

While they were at tea, Myrrha said:

"Aunt Daisy, in coming home we made a round that brought us through some grounds belonging to a most charming old red-brick manor-house. What's the mystery about that house? Mr. Stewart wouldn't tell me to whom it belonged, or answer any of my questions."

"How could we tell the owner was not in hearing, behind some of those great beech-trunks? It would hardly have been in good taste to speak disparagingly of a man while trespassing upon his property."

"Should you have had to speak disparagingly of him?"

"If I'd spoken as I think."

"What house was it?" Daisy asked Mr. Stewart.

"Redcombe."

"Oh!"

Myrrha, who was very quick, caught a particular expression in the eyes of Daisy and of Mr. Stewart, which made her sure there was some mystery in the matter. A suspicion of the truth flashed across her. Surely Mr. Stewart, whom she had called a pedant, and accused of being a music-master or a drawing-master, or both, could not be master of that fine old place, owner of those beautiful grounds! The suspicion made her heart beat faster, but she took good care to show nothing of it. She began to cross-question him:

"Is the owner of Redcombe young or old?"

"What you would call middle-aged, and incline to think venerable."

"About what age?"

"Well, I should say not much older or much younger than I am."

"Do you know him?"

"Yes."

"Do you like him?"

"Immensely sometimes; sometimes I find him the most dreadful bore."

"Which should I do? Like him immensely, or find him the most dreadful bore?"

"I would not venture to prophesy; rather the latter than the former I should, however, imagine."

"I think," said Myrrha, with a meditative air, and her eyes fixed full on Mr. Stewart, "that I should like him immensely."

"He would, indeed, be a fortunate man were that the case; but what makes you think you would like him?"

"To begin with, I generally like men about the age you describe him to be, so much better than younger men."

"I described him to be about my age."

"Yes. At that age one knows what a man is. He is not likely to turn out much better or much worse than one finds him. He is trustworthy, too. One can look up to him and feel confidence in him."

"It is a fortunate age, Miss Brown, if it inspires such sentiments in so charming a creature as yourself."

"You don't think me charming, I know. I wonder if the owner of Redcombe would!"

"May I ask what, besides his age, disposes you favorably toward the possessor of Redcombe?"

"I'll give you a frank answer, Mr. Stewart: his being the possessor of Redcombe."

"I like frankness."

"I am glad you find some one thing in me to like. I like to be liked."

"No doubt you do."

"Do you find any thing reprehensible in that?"

"Certainly not; it is an admirable quality; but whether it is more or less admirable depends upon the motives and the manner of its manifestation."

"You can never say any thing in my favor without nullifying qualifications, implied if not spoken. I wonder what you really think of me?"

"You take for granted I do really think about you?"

Myrrha colored delicately, but very perceptibly, a pink shade tingeing both her face and neck.

"Aunt Daisy, I'll tell you what I think of Mr. Stewart. I think of all the men I have ever encountered, he is the least chivalrous, not to say the most uncourteous."

"And of the men I know, Myrrha, he is the most chivalrous."

"I pity your unfortunate experience of men, then, Aunt Daisy. Possibly Mr. Stewart can be chivalrous and courteous to one woman, but that is not the characteristic of chivalry."

"Quite true," assented Mr. Stewart.

After a few minutes Myrrha resumed her cross-examination:

"Is there a croquet-lawn at Redcombe, Mr. Stewart? Does the mysterious owner, whom you and Aunt Daisy seem to wish should be nameless, give garden-parties?"

"A croquet-lawn!" repeated Mr. Stewart, reflectively. "I should think not. Redcombe is a very old-fashioned place, and I have not heard of any modern improvements. No, I should say there is not a croquet-lawn. Neither, to my knowledge, are garden-parties known at Redcombe. But, you see, Miss Brown, all this is easily changed. Of course, the owner of Redcombe would only need to know that Miss Brown desired these things, in order to institute them."

"You are chaffing me, Mr. Stewart. I suppose he isn't even calling-acquaintance of Aunt Daisy's—I haven't heard of Aunt Daisy's having one single acquaintance except you, Mr. Stewart. So, of course, you're only chaffing me."

"Let me see: chaffing you means amusing myself at your expense, doesn't it, Miss Brown?"

"You know it does."

"Well, I was hardly doing that. It isn't likely that the owner of Redcombe is as unchivalrous and uncourteous as you find me; and if he is not, why then, surely, my prophecy about him is not an unsafe one."

"Is he at home just now?"

"That depends in what sense you use the words 'at home'—he is in England."

Myrrha did not further pursue her inquiries. Having finished her tea, she went to the piano and began to play softly in the twilight. She seemed dreamily absorbed in the dreamy music; but she kept a sharp side-long watch on her Aunt Daisy's low chair in the window, over which Mr. Stewart was bending, till, by-and-by, he came to her side. Daisy, rising noiselessly, left the room, and strayed into the garden.

It was intolerable! What was? The fragrance and beauty of the evening, and the jubilant singing of that thrush.

Meanwhile Myrrha tried a little sentimental flirtation. Letting her soft music almost die away, she sighed a great sigh.

"I dare say you think me a very frivolous girl, Mr. Stewart?"

"You are very young, Miss Brown; you have time to improve."

"All the circumstances of my life have been against me. I have always lived with frivolous and worldly people. Of course it would have been very vain of me to encourage myself to be different from everybody about me."

"Are you not vain?" he asked with surprise that there should be room for question on this point.

"I don't really think I am very vain at heart."

"I wonder if you are right or not?"

There was a pause. Then Myrrha said:

"I hope, Mr. Stewart, you don't think me ill-tempered. Indeed, it is trying to be treated as you treat me; especially trying to me, who have never had any experience of the kind!"

"How do I treat you?"

"You snub me. That is, you're always saying hard things. It is good for me. I don't wish you to do differently. I may come to like it, but it is the first time I have been treated in this way; and to be treated first in this way by one whose good opinion and admiration one feels to be worth having, is rather trying, you must admit. So, if I seem rather ill-tempered under it, you must make excuses for me."

Myrrha dashed her handkerchief across her eyes. They were moist with the earnestness with which she had spoken; for certainly her feelings had been a good deal wounded.

Mr. Stewart did not speak immediately. Presently he said:

"Miss Brown, you bring a grave charge against me. I must have been monstrously impertinent. In my own defence I must say, that I believe I could hardly have transgressed in the manner you indicate, had you, yourself, not invited the criticism you have found it hard to bear."

"I did invite it, I wished for it. I could never feel you impertinent, however cruel I might think you. I hope you will continue to criticise me. I feel you may do me so much good."

"The post of mentor to a young and lovely lady is one of danger, Miss Brown! I am too old and wary voluntarily to enter the enchanted net I see so daintily spread for me. There is your Aunt Daisy—for counsel, for encouragement, for example, what more, or better, or different, can you require?"

"Aunt Daisy," said Myrrha, with a peculiar expression, "is—Aunt Daisy. To begin with, she has had no general experience of life to entitle her to speak with authority; to go on with hers is not an example I should wish to imitate. I am not naturally morbid, I don't wish to become so. I wish mine to be a bright, wholesome, practical existence. To end with, I know that I need to be governed by a man's will, scourged by a man's censure, stimulated by a man's praise. I have never been amenable to petticoat government." He thought the eyes with which she looked at him, saying this, splendidly audacious.

"I don't think you should be proud of that concluding confession, Miss Brown. I have always specially liked to see young girls render docile and reverent submission to women. I have noticed this docility, as girls, in some of the most admirable women I have known. I have noticed, too, that often girls who profess extreme docility to masculine guidance, and submission to masculine judgment, really desire only masculine admiration, and, when married, often make rebellious and headstrong wives."

Mr. Stewart had been stung by the half-contemptuous tone in which Myrrha spoke of Daisy, and his own tone was harsh. There was a pause: then Myrrha said, softly and sighingly through the dusk:

"I am very unfortunate, Mr. Stewart. All I say and do seems to provoke your dislike."

"Dislike of some things you say and do need not imply dislike of yourself, Miss Brown."

"Perhaps, Mr. Stewart, I should feel less as if it did imply that dislike, if you wouldn't call me always by my hideous common name, 'Miss Brown.' If you would call me 'Myrrha,' the hard things you say wouldn't seem quite so hard."

"But, possibly, I don't wish them to be less forcible."

"Won't you call me Myrrha? I'm such a child to you. There can be no harm. Why, I suppose, you are old enough to be my father, almost. Promise that you will call me Myrrha when you are not angry with me. Do, Mr. Stewart." And she laid her hand coaxingly on his arm.

"By-and-by, we will see about it. At present we are very recent acquaintances."

"I don't feel as if we were. And you don't treat me as if we were—when you wish to scold me, to be unkind."

"I think we agreed that your condescension, not my presumption, was answerable for any transgressions of mine?"

"There is no condescension, no presumption, no transgression. But, if there is any blame, it is mine."

"That is a very generous statement, Miss Brown."

"Won't you reward it by a generous concession, and call me Myrrha?"

"Will you, Myrrha, accept from me, *à propos* of condescension and presumption, a brotherly, fatherly, if you prefer it, hint, on a very delicate subject?"

"Any thing that you say to Myrrha, and not to Miss Brown, will be listened to patiently."

"I was shocked to-day by my groom's manner toward you, Myrrha, its half-jocose familiarity. I shall blow him up, and he will excuse himself by saying something about the young lady's 'condescension.' You don't exactly understand English usages, I fancy. And English servants don't understand American liberty of manner. An English young lady who leaned against a paling slashing herself with her whip, and laughing and talking freely with a groom, would be considered—well—objectably fast—not well-conducted—not any thing you would wish to be considered."

Myrrha put her hands up to her face; though the dusk would alone have sufficed to hide her blushes, or the absence of them.

"Oh, Mr. Stewart," she said; "thank you, a thousand times."

"Thank you, Myrrha, for taking my warning in such good part."

"I hope you may find that I shall always take in good part any thing you may say to me."

"I may not have many opportunities of trying you."

"Oh, Mr. Stewart!" in very genuine consternation, "I hope you don't mean you are going away?"

"There is a possibility that business may take me from the neighborhood. You are alarmed at the prospect of losing your rides?"

"At that—and many other things."

"I could secure you the rides, and the attendance of a careful old servant."

"Then, of course, I should not regret you."

"Of course you would not. You would have the physical enjoyment without the metaphysical annoyance."

"Mr. Stewart, you are hoping I shall say something pretty and flattering."

"Am I?"

"Yes. Not because you care for what I say; but because men always care to be flattered and regretted by women."

"Do they? I wonder if your experience of men and women is drawn chiefly from novels, or from life?"

"Which would you say, to look at me?" And she turned her fair young face full upon him, bringing it very near his.

"I wonder where your Aunt Daisy is all this while?"

"In the garden, Mr. Stewart. She passed the window just now. I was just thinking of looking for her. Aunt Daisy declares that you are not her lover, only her friend, and that she never intends to marry, or I should have thought of the possibility of her being jealous of your kindness to me."

Mr. Stewart laughed, and Myrrha did not admire the tone of his laugh. She wished it had not been so dusk, she wanted to see the expression of his face.

"You had better not go out in those diaphanous draperies, now the dew is falling," he said. "I will find your Aunt Daisy, and say

good-night to her—as I say it now to you. Good-night, Miss Brown. I am sure you will be too tired to ride to-morrow—we will hope for a fine day after to-morrow.”

“There is no chance of my being too tired; but you will find me too troublesome if I want to ride every day.”

He was gone. She watched the meeting in the garden, and the parting which followed upon it immediately; then, directly Daisy came in, Myrrha, pleading extreme fatigue, said good-night to her, and went to bed.

CAMILLA.

IN the spring of 1808 the Italian seaport town of Leghorn was garrisoned by French troops, among which was the Twenty-ninth Regiment of light infantry, commanded by Colonel d'Hervilly, a man about thirty-five years of age, who had distinguished himself on more than one occasion, or the emperor, notwithstanding he was of an old and distinguished family, would not have entrusted him with a regiment.

In the regiment there was one Charles Dufresne, who, although scarcely thirty, had spent half his life in a uniform. With his command he had seen more or less of almost every European state, had distinguished himself on many a hard-fought field, had won the much-coveted cross of the Legion of Honor, and would, doubtless, have long since been rewarded with a commission if his colonel had not been averse to recruiting his officers from the rank and file.

Dufresne was a handsome, clever, wide-awake young man, a thorough and highly-exemplary soldier. He had never been subjected to any military punishment, and was full of enthusiasm for the emperor, the *gloire de la grande armée*, and *la belle France*. He was well acquainted with the usages of the polite world, and his literary acquirements were greater than were, in those days, demanded of an infantry-officer. In fact no one could understand why he was not promoted, he himself least of all; for, like the major part of his countrymen, he had no mean opinion of his own merits, yet, although of a naturally impatient and fiery nature, he was too good a soldier not to wait patiently.

One fine summer evening Dufresne, with two of his comrades, sauntered through the Gli Sparti, a much-frequented promenade, that separates the city proper from the suburbs, and completely encircles the former.

The young sergeant was this evening in his usual good-humor; he had, indeed, never experienced any of the greater ills of life. His parents died when he was but a child; his fortune was his monthly pay, which he so husbanded as to make it supply him with all the little comforts and luxuries he coveted; he had never loved hopelessly, and in the dim future he saw visions of a marshal's *bâton*—in spite of the prejudices of his colonel—as did every young soldier of the first empire.

It still wanted an hour of the time when the tattoo sounded. For the moment, therefore, the three friends were at liberty to consult their inclinations.

“Let us go into one of these *cafés*,” said one of them.

“Agreed! I would like an ice,” replied another.

They selected a *café* with a diminutive garden before it, which was brilliantly lighted with a great number of Chinese lanterns, and filled with tables and chairs, and was evidently well patronized by the better classes.

They had hardly found places and ordered some refreshments, when the buzzing, incident to such assemblies, suddenly ceased, and every ear was intent upon listening to the tone of a guitar, that seemed to be the introduction to a song.

“It seems we have stumbled into a concert,” said one of Dufresne's comrades, evidently little pleased.

“No matter; let us see if it is worth listening to,” replied the sergeant.

In the guitar tones they soon recognized a melancholy and pathetic Italian *aria*, the words of which a fresh, full, well-cultivated female voice began to sing. The garden was so full that the three friends could not see the *cantatrice*, although in their surprise they did their utmost to gratify their curiosity.

The mild, balmy evening, the peculiar illumination of the scene, and, above all, the pure, expressive tones of the singer, combined to

touch the sensibilities of young Dufresne, and, if he had any poetry in his nature, to lead the way into a land of sweet, but perhaps somewhat melancholy dreams. There was not a sound to divert the attention from the *aria*—the guests ceased their chat and clinking of glasses, and listened with the most profound attention.

When the singer had ended, there followed such a round of applause as none but the mercurial Italians know how to delight an artist with, while the singer stepped out of a little arbor near the house, her guitar in one hand and a sheet of music in the other. She went from table to table, gathering the small coin that seemed to flow bountifully into her garner. More than one of the guests tried to engage her in conversation, but her replies were, although courteous, by no means calculated to encourage familiarity, and she tarried nowhere longer than was necessary.

“If this woman's face possesses half the fascination of her voice she does a thriving business without a doubt,” remarked one of the sergeant's friends. “But why so silent and thoughtful, Dufresne?”

“I must confess,” replied the young sergeant, “that this beautiful *aria* cradled me into a dream out of which I waken most unwillingly. We have here only a *café* ballad-singer, and yet she is an *artiste*. It pains me to the heart to see such talent and such cultivation as hers compelled to seek bread in a place like this.”

The singer, at this moment, approached the table at which sat the three soldiers, and the light of one of the lanterns fell full on her figure and features. The former was full and symmetric, and made a pleasing impression, as she was not dressed in that gaudy style usually affected by women of her class. Her bearing was modest, almost to timidity; she seemed, indeed, unwilling to look up, although she certainly need not have been averse to showing her face, which, it is true, was somewhat pale, and looked care-worn, but was cast in beauty's mould, and illuminated with a pair of those lustrous eyes that are rarely met with except in the warmer climates.

The young men had pictured to themselves an entirely different being, and were evidently surprised, particularly Dufresne, whose gloomy mien was quickly dissipated by a glance at the fair petitioner. Was it admiration for her beauty, or sympathy for her lot, that prompted him?—he quickly returned the small coin he had destined for the sheet of music, to his pocket, and, in its stead, laid a large silver-piece on the paper.

Surprised by the generosity of a common soldier, the girl raised her large, brilliant eyes to his an instant, then dropped them as quickly, while a modest blush mantled her cheek, and she bowed her thanks passing on before Dufresne or either of his comrades could find a word to address to her.

“The devil! but isn't she pretty!” exclaimed one of them. “Eyes like carbuncles and lips like coral; but what a sad expression! Even Dufresne's generosity was lost on her.”

Having completed her round, the singer returned to the arbor, and, unnoticed by all eyes except the sergeant's, who followed her step by step, she quickly left the garden by a side entrance. Involuntarily Dufresne made a move as though he would follow her, but, fearing that he would be observed, he resumed his seat.

The next evening, the young sergeant found himself, this time alone on the Gli Sparti, but he looked neither to the right nor the left, and hastened his steps until he reached the *café* garden, which was as well filled as on the previous evening. He entered and was soon comfortably seated near the arbor.

Who will doubt that the hope of seeing and hearing the pale singer again had led the young Frenchman thither? She was there, and it was, perhaps, due to her that the establishment was so largely frequented. Her voice was as pure and full, her execution as brilliant and her manner as modest and fascinating, as it had been the evening before. No one noticed the sergeant; if any one had, he would not have failed to remark the agitation mirrored in his handsome features.

At the close of the improvised concert, the singer again went round to take up the usual collection. When she came to the sergeant's table, as before, he laid a large silver coin on the sheet of music; as before, she glanced at him hastily, and as she did so her hand trembled visibly, while her cheeks were suffused in a deep crimson.

The tattoo resounded through the city, but Dufresne kept his seat until he saw the singer, as on the previous evening, pass out at the side, when he rose and followed her.

At a rapid step she crossed the promenade and turned toward the poorer suburbs. Her haste betrayed either anxiety or timidity.

Although the sergeant kept within a few steps of her, he did not venture to approach nearer and speak to her—an exhibition of timidity quite foreign to his character.

The streets became more and more deserted and darker. The girl looked around once or twice, but, whether she recognized Dufresne or not, she quickened her step and was evidently averse to accepting an escort.

If the sergeant's intention was, as it seemed, to make the girl's acquaintance, his object would not, had not chance favored him, been attained.

Four or five young men came down the street, arm in arm, singing boisterously, and it was not unreasonable to suspect that the unprotected girl would not be able to pass them unmolested.

The singer hesitated, and seemed undecided what to do. In a moment Dufresne was at her side, and respectfully proffered his protection until the convivial party should pass.

The girl glanced toward the approaching party of brawlers, and then at the young French soldier, whom she evidently recognized. After a moment's hesitation, she laid her arm in his; but she was too greatly embarrassed to venture any remark, nor was her cavalier scarcely more at ease.

They passed the young men unmolested. The street was again still and deserted, but the sergeant neither took leave of the young girl, nor did she withdraw her arm.

"I think, mademoiselle, I have seen you in a *café* on the promenade," observed Dufresne, finally breaking the silence.

"I sing there almost every evening, signore. I am poor, and have duties to fulfil toward one to whom I am greatly indebted," she frankly replied.

"This person, whoever it may be," replied the sergeant, who, perhaps, felt a slight twinge of jealousy, "should not expose you to the danger of returning alone and unprotected through these dark, deserted streets at so late an hour."

"Oh, signore, you do him injustice. If he were not confined to his bed, he would not fail to accompany me as he always used to do."

For a moment, the young man was silent; then he asked in a tone that, in spite of him, was slightly tremulous:

"Ah, mademoiselle! then you have a friend?"

"One, and but one, in the wide world. And every evening, when I return to our little humble home, I fear that death may have robbed me of him."

Dufresne's brow became darker still. A friend! their little home! He almost regretted that he had offered her his protection. And she was so naïve, spoke so frankly of her relations! Was it to be wondered at in one of her profession?

"And you provide for your sick friend by singing, mademoiselle?" he asked, in an absent tone.

"For the last three months, yes. If I had to provide for myself only, I would not sing in such public places, and even now I would rather work with my hands, but my old master will not listen to it."

"Oh, this friend is your old master, your teacher!" said Dufresne, greatly relieved.

"Accident threw us together when I was still a small child, and he was already an old man. I love him as a father, and he loves me as his own daughter."

Involuntarily the sergeant pressed the girl's arm closer, and said:

"If you would ascribe it to the deep interest I feel in all that concerns you, and not to idle curiosity, I would ask you to tell me something more of yourself—something of your past history."

The girl hesitated a moment, and then replied:

"My past and my present life, signore, has no secrets; but its story is so simple, that it would, I fear, fail to interest you."

In a few words she told her companion that she was the only child of some country-people, who lived near Florence. At the early age of ten years she was an orphan, and wandered out into the world heedless of the future, depending upon the singing of a few simple ballads for subsistence. In her wanderings, she chanced to meet with her old master, who, although a proficient in his art, was, like herself, compelled to sing in the highways for bread. He recognized her talent, and became her protector and teacher—to him she was wholly indebted for whatever musical education she possessed. Now the old man was ill, not able, indeed, to leave his bed, and it was but natural

that Camilla should, so far as was in her power, provide for him.

Dufresne listened attentively, and her simple narrative only served to redouble his interest. Arrived at her door, she thanked him kindly for accompanying her, bade him good-night, and quickly disappeared.

Sergeant Dufresne now became a daily visitor at the *café* on the Gli Sparti, from which he regularly accompanied the singer home; and, if any one had observed the two young people, as they walked slowly toward the distant suburb, he would have decided that they were more to each other than ordinary friends.

Thus passed two or three weeks. The young sergeant became daily more silent and thoughtful; and Camilla assured him that, on account of her dear old *maestro*, she often sung with tears in her eyes.

To the many patrons of the *café*, the last few days had added one, whom Dufresne would rather have seen anywhere else. It was Colonel d'Hervilly, a man noted for his haughty bearing, his good looks, and his gallantries.

That the colonel was attracted by the pretty singer was very evident; indeed, he made no secret of it. He rewarded Camilla's efforts in gold, and seemed to think his generosity gave him the right to evince his admiration unrestrained, which caused the other guests to smile, the sergeant excepted.

Usually Camilla left the garden so quietly, that no one but Dufresne, to whom she was now accustomed to make a sign, knew when she went, or what path she took. One evening, however, they were hardly on their way, when, to their astonishment, they saw they were followed by the colonel.

The sergeant found himself suddenly in any thing but an enviable situation, for, besides being the rival of his commander, which was not pleasant, the latter was cognizant of his disregarding a strict regulation of the service, for the tattoo had already sounded.

At first the colonel kept some distance behind them; but, when they reached the deserted streets of the suburb, he quickened his step, and was soon at Dufresne's side.

"Are you not Sergeant Dufresne, of my regiment?" he asked, in a haughty tone.

"I am, colonel."

"And you are at this late hour in the streets, instead of being in your quarters?"

"Colonel," replied the young man, whose blood boiled with indignation, "to-morrow I shall be at your disposal, and shall expect the punishment my neglect of duty merits; at the moment, my first duty is to see this lady safely home."

"Sergeant Dufresne," cried the colonel, "you will go immediately to your barracks and report yourself, at the watch-house, as a prisoner by my orders."

The colonel, according to all military notions, was in the right; but certainly his course was most ignoble, if, as we suspect, he had any designs on the singer.

"Obey!" whispered Camilla, greatly terrified, to her companion.

"I will obey your orders, colonel," replied the sergeant, involuntarily laying his hand on the hilt of his sabre, "when I shall have protected my *fiancée* against indignities that I have reason to fear to-night more than ever before."

Whatever Camilla may have thought of his using the word "*fiancée*," she did not contradict him, but remained silent.

"You are an insolent rascal, a mutineer!" cried the colonel. "Return immediately to your quarters." And in his rage he laid his hand rather heavily on the woollen epaulet of the sergeant.

Quicker than thought the sergeant loosened his hold of the girl's arm, drew his sabre half out of its scabbard, and, stepping directly in front of the colonel, said, in a tone tremulous with rage:

"Your designs are clear to me, Colonel d'Hervilly; but I will not suffer you to offer any indignity to this young girl, and therefore I shall not obey your orders, until I see her safely to her door. Do not forget that at this moment our relations are not those of superior and subordinate, and that we are here alone, without witnesses."

The colonel was speechless with rage; he, too, was about to draw his sword, when the tread of the patrol coming down the street was heard. Camilla, seeing the file of soldiers approach, hurried home with all possible speed. Dufresne replaced his sabre in its scabbard,

and calmly awaited the issue. He was too proud to fly, even had flight not been useless.

When the patrol came up, the colonel ordered the sergeant to be taken to the guard-house and placed under arrest, saying that, in the morning, he would direct what disposition should be made of him.

A half-hour later, Dufresne was in close confinement. The guard consisted of men from D'Hervilly's regiment, and, indeed, was commanded by one of Dufresne's two friends, whom we saw with him the first evening on the Gli Sparti. In the guard he, therefore, very naturally found warm sympathizers, and, although he only acquainted his comrades in general terms of the occurrence that led to his arrest, they all espoused his cause, and censured in strong terms the course pursued by their unpopular colonel. They contended that he had misused his authority and disgraced his uniform. An hour after day-break, Dufresne's misfortune was known to the whole regiment, and there was, perhaps, not a man in it who had not expressed himself in very harsh terms of his commander.

Whether the colonel was advised by the officers of the true state of things or not, he ordered the prisoner to be put in irons and confined in a cell, and to be arraigned for mutiny and threatening a superior with deadly weapons. These orders had, of course, to be obeyed.

On the second day after Dufresne's arrest, after the first session of the court-martial, it being now very evident that the colonel was serious in his threats, the interior of the citadel, where the regiment was quartered, presented an unusual aspect. The soldiers on duty were at their posts, it is true; but those off duty, instead of going into the city, as they were at liberty to do, remained at the fort, gathered together in groups apparently discussing some topic of unusual interest. Now and then a "Vive Dufresne!" might have been heard from some one of the groups, and the eye need not have been very experienced to have seen in these demonstrations the beginnings of a mutiny. As the officers found themselves unable to suppress these evidences of discontent, they determined to lose no time in advising the colonel, who had his lodgings in the city, of their fears.

D'Hervilly was evidently greatly irritated, but he insisted on treating the matter as a *bagatelle*. The old major, who went to him, although at heart in sympathy with the soldiers, insisted that measures should be immediately taken to prevent the threatened outbreak.

"Very well!" cried the colonel, finally, "I will ask the commandant to have my regiment consigned to their barracks, and the guard intrusted to another."

"That would be most unwise, and a disgrace for the Twenty-ninth. It would make matters worse instead of better."

The old major remonstrated in vain; the colonel was as obstinate as he was haughty, and ended the interview abruptly by forbidding the major to offer him any further advice.

When the veteran informed his brother officers of the result of his mission, they were highly incensed, and not only ceased their efforts to reestablish order, but nearly all of them went into the city, as they were accustomed to do, leaving the colonel to help himself as best he could.

In the mean time the excitement among the soldiers continued; no one, however, ventured on a breach of discipline. But they could hardly believe their eyes—being ignorant of what had passed between the colonel and the major—when they saw a file of men from another regiment march into the enclosure of the citadel to relieve the guard. At the same time Colonel d'Hervilly, accompanied by his adjutant, appeared on horseback, and, in a haughty tone, commanded the soldiers to retire to their barracks.

It was already nearly nightfall. The colonel and the file of men he brought with him were received with an ominous silence; but D'Hervilly had hardly finished giving his orders when a voice cried out:

"Comrades, this is an indelible disgrace for the Twentieth-ninth! Shall we endure it?"

As the first flash of lightning is often followed by the whole force of a thunder-storm, so were these words, uttered by one of Dufresne's hot-blooded young friends, followed by a general cry of indignation and menace.

"We'll not submit to it!" cried a hundred voices. "The old Twenty-ninth will not be surrounded by recruits. Is this our reward for Arcole, Friedland, and Marengo? Down with Colonel d'Hervilly! Vive l'empereur!"

It would be impossible to describe, in detail, the scene that now presented itself. The so severely disciplined soldiers, old and young, seemed to have forgotten every law of military subordination; the men off guard seized their arms, and it was easy to be seen that they were determined not to yield their posts to the new-comers without a struggle, but the latter seemed not the least inclined to use force. Open mutiny existed everywhere! The majority of the officers, who were present, were at a loss what to do, and the commands of the others were disregarded.

Colonel d'Hervilly cried out and gesticulated like a maniac, having in his rage entirely lost command of himself. Personally brave, he drew his sabre and rode into the thickest of the crowd; but a score of hands seized his horse by the head and thrust him back, while a thousand menaces greeted his cars. It was with difficulty that his adjutant and some of the other officers succeeded in extricating him and inducing him to withdraw. With him went the new guard, who fully sympathized with their comrades.

Now in breathless anxiety, but with a resolute mien, the soldiers of the Twenty-ninth awaited further developments. They did not venture to liberate Dufresne; indeed, they were painfully conscious of having already gone too far.

An hour later all the troops of the garrison were under arms, marching toward the citadel—the Twenty-ninth regiment excepted, which had received orders not to leave its quarters. The citadel was soon surrounded, and the cannon of the outworks turned upon the fortification itself. A half-hour later the Twenty-ninth had been disarmed, the guard relieved, many arrests made, and the mutiny entirely suppressed.

The colonel, however, had little cause to congratulate himself on the issue, for the commandant of the post suspended his authority until he should receive instructions from the emperor, to whom he immediately dispatched a courier.

Napoleon was greatly incensed against the colonel, whom he immediately relieved of his command, as well as against the regiment, which, in his opinion, had disgraced the whole army.

The Tuscan provinces were at this time under the government of Prince Borghese, a brother-in-law of Napoleon, whose residence was at Turin; as, however, he was not a soldier by profession, the emperor instructed another of his brothers-in-law, Joachim Murat, the Grand-duke of Berg, the most distinguished cavalry-general of the imperial armies, to repair immediately to Leghorn and punish the mutineers with the extreme rigor of military law.

The instructions of the emperor were positive, as they always were. In his opinion the offence could be expiated only with blood. Murat was directed to have the leaders of the mutiny shot—the number being left to his decision, and the emperor would have been highly displeased had his lieutenant not followed his instructions to the letter.

The garrison of Leghorn was greatly terrified when the grand-duke, who, in obedience to the emperor's commands, travelled with all possible speed, suddenly arrived in the city. It was now very evident that Napoleon intended to show no mercy to the culprits—and who would have been so bold as to oppose his imperial will?

Immediately after his arrival, the handsome, chivalrous marshal took the affair energetically in hand. Murat was not cruel, but he was a severe disciplinarian, and devoted heart and soul to his imperial brother-in-law, and, when he appeared before the assembled garrison, his brow wore a threatening aspect. He made a lengthy speech, which was far from reassuring the unfortunate Twenty-ninth, terminating with a demand that they should appoint a deputation to conduct their defence.

The proceedings of the court-martial were hurried forward with all possible dispatch. Murat received the deputation and listened to their charges against Colonel d'Hervilly attentively, but, from his forbidding mien, it was evident that he did not justify the mutiny. His sense of justice, however, would not allow him to execute the extreme rigor of the law, for he saw that the blame lay more on the side of Colonel d'Hervilly than of his men; he, therefore, decided that only three of the mutineers, as an example to the rest, should be shot. The melancholy choice fell on Sergeant Dufresne and his two young friends, who had been loudest in expressing their indignation, and among the most prominent actors in the scene with the colonel.

The marshal ordered the execution to take place the next morning in the presence of the whole regiment, which, as a further punishment, was to be marched immediately to another post.

Under the circumstances, the sentence was severe, it is true; but Murat, however great his desire, could not have been more lenient without incurring the displeasure of his imperial master, who, in such cases, never showed any mercy.

The news of the sentence pronounced by the grand-duke spread quickly through the garrison and the city, and filled every one with sorrow, while the three unfortunates, who were confined in separate cells, were summoned to prepare to meet their doom.

During his imprisonment, Dufresne was agitated by the most conflicting emotions. The silence of Camilla—but how could she have communicated with him, however much she may have desired to do so?—wounded him deeply, and tended to lessen his passion for her. As for his sentence, he had no doubt what it would be, after he heard that his arrest had led to a mutiny, nor had he now any hope that it would be commuted.

Who can form an idea of the sensations that filled the young man's bosom? To die so young, and such a death, only because in his opinion he did what his manhood and honor demanded!

On the battle-field he had often looked death in the face, and now to die at the hands of his comrades—the thought was terrible! And then, worse still, he was the cause of two of his faithful friends filling early and honorless graves. His fate was sad indeed!

With soldier-like composure, but without the least bravado, he listened to the reading of his sentence, and commissioned the officers, who had been charged with the painful duty of advising him of the decision of the court, to say to the grand-duke that, being fully conscious of the gravity of his offence, he had not doubted what his punishment would be, and that he thanked him his death was, at least, to be that of a soldier.

He was still too young, vigorous, and fond of life's pleasures, to leave the world willingly; and then he had pictured the future in such glowing colors! But now he was in so mild and humble a mood that he forgave even Colonel d'Hervilly; and, if he had censured Camilla for her seeming selfishness and want of sympathy, he now felt that he had been unjust, begged her forgiveness, and was persuaded she suffered even more than he did himself. His love for the singer had again taken complete possession of his heart, and he would have given anything to see her and speak to her once more before the fatal hour. That in this—his last wish—he would, however, be gratified, he had not the least hope, for it was not probable that, should Camilla ask to see him, her prayer would be granted.

His cell was in the outer casemates of the citadel, and was provided with only one window, or rather loop-hole. The casemate was surrounded by a *fossé*, beyond which lay the glacis of the citadel, a promenade not much frequented, it is true, but from which he could occasionally hear a merry peal of laughter that seemed to him like bitter mockery. But, as the evening advanced, these sounds became less and less frequent, and he felt himself more wretched and forsaken than before.

"Would it were all over!" he sighed more than once.

Dufresne had no farewell letters to write to relations; at one moment he thought of leaving a few lines for Camilla, but, upon reflection, he feared it might compromise her, and so he denied himself even this poor consolation. Counting the hours that yet remained to him, he lay on his hard couch, and abandoned himself to a review of the past.

Without, all was dark and silent. Suddenly he heard the tones of a guitar coming from the glacis opposite his loop-hole, then a female voice began to sing a melancholy song that he knew only too well—it was one Camilla often sung.

He sprang quickly to his feet, and approached the window as near as his chains would permit. He recognized the voice, and listened breathlessly. The singer seemed at times almost stifled with sobs. His heart leaped for joy, for now he knew that Camilla had not forgotten him, and that she mourned his fate.

In a little time the sorrowful melody gave place to another—an air full of hope. What did she mean? He could not ask, nor could she have answered.

Again all was silent, and again he sought his couch, more sorrowful and cast down than ever. How much more he longed to live now that he knew he had not been deceived in Camilla!

In the mean time Murat was alone in his private apartment, walking slowly to and fro in a state of evident unrest. His thoughts were

busy with the three unfortunate prisoners, who were so soon to die in the pride of manhood, whom he esteemed as brave soldiers, and would willingly have pardoned, had he dared to do so.

The grand-duke had given orders to admit no visitors; his servant could not, however, resist the entreaties of a beautiful girl, who pleaded with tears and sobs to be allowed to see the marshal.

Murat was no woman-hater, and, after a moment's hesitation, ordered the young lady to be admitted.

It was Camilla. She was paler than usual, and dressed in deep mourning; but, plain as her attire was, there was so much modest dignity in her bearing, that Murat thought he had some great lady before him. As he was about to offer her a seat, she sunk at his feet and raised her large, tearful eyes to him with a look that was full of the deepest despair. Her agitation was so great that she was unable to utter a word, but her silence was perhaps more eloquent than would have been her speech.

The generous heart of the marshal was visibly touched, and, if it were in his power to grant the petition of the fair suppliant, it was evident she would not plead in vain.

He raised her from the ground and led her to a seat, with the assurance that he would most willingly serve her.

It was some moments before Camilla recovered her self-possession sufficiently to speak. As Murat gazed at her beautiful face before him, bathed in her tears, he felt an increasing desire to grant her petition, whatever it might be. But, when she pronounced the name of the condemned Dufresne, an ominous expression of sorrow clouded the marshal's brow. He listened to her patiently, and, when she confessed that she passionately loved the young sergeant, he seemed deeply moved; but, when she had finished, he explained to her, mildly and clearly, that it was not in his power to change the doom of her unfortunate lover.

The servant in the anteroom must have heard a heart-rending cry from a female voice in his master's apartment. The marshal, however, did not call him in, and a half-hour passed before the door opened.

Murat himself accompanied his visitor to the head of the stairs, where he took leave of her with every evidence of respect and sympathy. As he returned, he motioned to his servant to follow him.

He was very grave, and walked hastily up and down the room with the air of one who hesitates between desire and fear. Suddenly he stopped and told his servant to give him his sabre, mantle, and a hat that bore no insignia of his rank.

"I have just passed a painful half-hour, Lafleur," said he to his servant, as he buckled on the sabre. "This young girl is the *fiancée* of one of the three men who are to be shot to-morrow morning, and came to ask me to spare his life. I could not grant her petition—it was impossible. The poor girl swooned, and I had great difficulty in bringing her to and consoling her. The most I could do was to promise to be myself the bearer of her parting salutation to her lover, and I will keep my word."

It was nearly midnight when Dufresne was startled by the opening of his cell-door, but he was equally overjoyed when he saw his two unfortunate comrades, who had been relieved of their chains, enter his cell. He did not venture to ask them if they had been pardoned—their sorrowful mien rendered the question unnecessary.

"There is no hope," said one of them, while the provost relieved Dufresne also of his fetters; "the grand-duke himself will speak with us once more, but, in order that we may not entertain vain hopes, he at the same time informs us that the execution will positively take place at five o'clock in the morning."

In a few moments Murat entered the dark cell, and ordered those who accompanied him to retire and leave him alone with the three prisoners, who received him as they would have done on dress-parade.

For a full hour the marshal remained with the criminals. The officers of the guard began to be alarmed about him, for at first they heard him talk in a loud, angry tone, and now not a word could be heard through the heavy, iron-plated door.

Finally the marshal reappeared with the cold, grave mien of one who has just discharged a great and painful duty. He directed that the prisoners should be allowed to remain together until the hour of the execution, which should be conducted in accordance with his previous orders.

So no mercy!

The next morning, at five o'clock, the Twenty-ninth Regiment of light-infantry, with their knapsacks packed for a long march, but without their eagles, stood drawn up on the glacis bordering the fossé of the citadel, in such position as enabled them to look into the enclosure. Many of the soldiers had tears in their eyes, and all wore a sorrowful mien. Between the glacis and the citadel-wall there was a newly-dug grave large enough for three human bodies.

The sun in all his beauty was just rising above the distant hills, but he could not dispel the cloud that hovered over this melancholy scene.

Punctually at five o'clock, one of the citadel-gates opened, and a small procession approached the grave. It was led by a muffled drum; then came a small detachment from another regiment of the garrison, with the three condemned men in the centre, the regimental chaplain on one side and the provost on the other. The three advanced with a firm step, their eyes cast down, and looking very pale. In the regiment not a sound, not even a whisper, was heard.

The ceremony was brief, as it always is in such cases.

While the troops presented arms, the condemned men listened again to the reading of their sentence, which Murat, in the name of the emperor, had confirmed. Then they kissed the crucifix, and knelt on the pile of sand that had been thrown out of the grave. Three platoons took position a few steps in front of them—the provost bound their eyes, one after the other, with a white handkerchief—they had looked on the sun for the last time!

Now the soldiers of the platoons raised their muskets to their shoulders—the word "Fire" was heard from the officer in command—a flash, a sharp report, a light cloud of smoke, and the three unfortunates had fallen backward into the open grave. The drums beat three rolls, the new commander of the Twenty-ninth wheeled his regiment to the left and marched away, leaving the scene deserted except by the three or four men who were to fill up the grave.

The three unfortunate friends lived long in the memory of the once mutinous regiment, which in the next campaign regained their eagles and the favor of the emperor.

At a late hour, the evening after the execution, three men, dressed like laborers, carrying small bundles, went on board a ship in the harbor of Leghorn, that was to sail in a few hours for America.

They ended their way silently through the dark streets, and seemed greatly cast down. Before they ascended the ship's plank they paused a moment, and seemed to take a mute but painful leave of the land they were about to quit.

The captain must have expected them, for, after glancing at a paper one of them handed him, without asking any questions, he led them to the cabin. As they entered the dimly-lighted apartment, a female figure, dressed in a plain, dark travelling-habit, arose before them.

At sight of her, one of the men cried out, in the greatest amazement, while he clasped her in his arms:

"What, Camilla! you here? And you have come to say farewell to me?"

"No, my friend, I have come to accompany you, if it is your wish that I should. This is a promise exacted from me by the best and noblest of men, Marshal Murat."

Dufresne embraced her tenderly, and, turning to his comrades, presented them to the blushing Camilla, who was radiant with joy, in spite of her tears. There was nothing to prevent her accompanying her lover, as her old *maestro* had closed his eyes in death the day after Dufresne's arrest.

The soldiers of the three platoons were ignorant of the fact that the officer who commanded them, just before the execution, by order of the marshal, had drawn the bullets from their muskets.

The generous Murat had not only paid the passage of all four to America, but had given to each one a handsome sum of money with which to begin life anew in the New World.

FROM HONG-KONG TO FUH-CHAU.

TOWARD the close of the last decade, I engaged a berth in the steamer *Undine*, of Hong-Kong, for the purpose of proceeding from that port to the city of Fuh-chau-fu, in the province of Fuh-Kien.

One sultry afternoon, a fast gig, built on American lines, but manned by six skilful native oarsmen, conveyed me aboard, and, an

hour afterward, the pretty propeller steamed swiftly away from her moorings and entered the Ly-tse-moon passage, just as the sun sunk in a blaze of scarlet and gold behind the towering hills that close the vale of Wong-nei-chong. In the glimmering twilight we passed Mirs Bay and sighted a small rock, of volcanic origin, usually known as Pork-pie, probably from its resemblance to the shape of that comestible, just as "Night hung her curtains up, and pinned them with bright stars."

When I went upon deck at an early hour the following morning the *Undine* was passing Breaker Point; soon afterward she rounded a promontory called the Cape of Good Hope, ran through a narrow channel, and cast anchor off Double Island, which is situated about nine miles below the city of Swatau. The island is clothed with verdure from base to summit, and presents a fine contrast to the mainland, upon which hardly a tree or shrub is to be seen, nothing but hillocks of yellow sand, dotted with huge bowlders of gray granite, meeting the eye of the observer.

The foreign merchants generally reside in pretty villas and bungalows which they have erected upon the island, as it is not considered safe for them to make the city proper their abode, on account of the almost nightly incursions of the inhabitants of neighboring villages, with whom the people of Swatau maintain incessant hostilities. After discharging a portion of our cargo, we proceeded up the river, which is about a mile and a half wide, but difficult of navigation, as numerous rocks and shoals lie beneath its turbid surface, and anchored a little above her Britannic majesty's consulate, a fine edifice that stands, almost alone, upon the western bank. As a fellow-passenger had a little business to transact in the city, I went ashore with him, and we visited a few native hongs; but we did not stay long, and I did not regret leaving, for there was little to be seen worthy of notice, and the noxious smell in all the streets through which we passed was very disagreeable. I remarked, however, that the natives were much more stalwart and muscular than the Cantonese; they were also rougher and less courteous.

The *Undine* steamed back to Double Island, took in a little cargo, and the same afternoon resumed her voyage. We passed through a broad channel, which separates the island of Namoa—a place famous and favorable for opium-smugglers a few years ago—from the mainland, just before sunset, and sighted Dannebrog at dusk. During the night we passed the Lammocks, a group of sterile islets, and Old Thunder-Head, a valuable landmark, and, just as dawn flushed with roseate hue the eastern sky, Chapel Island came into view. Two islets, The Brothers, lie across the entrance to the isthmus in which Amoy is situated, and, near the narrow channel through which all vessels from the southward have to pass, a dangerous reef, known as the Chaw-chat, lies *perdu* beneath the smiling blue water. The commander of the *Undine* knew the coast perfectly, so we entered in safety and anchored in the deep, crescent-shaped harbor that is formed by a narrow channel which divides the island of Kow-lean-seau from that of Amoy.

At all the ports in China which are open for foreign traffic the imperial government collects custom-duties on imports of almost every description. As merchants in the far East consider it only a venial sin to evade these dues, of course a considerable amount of smuggling is carried on, and, in order to prevent this as much as possible, the authorities provide foreigners as tide-waiters. They would not benefit much by this arrangement, however, for the men who fill these positions are generally adventurers of lax morals, who would readily accept a bribe did they not donate about two-thirds of the value of the articles confiscated to the officer who makes the seizure. As the day on which we arrived in Amoy chanced to be Saturday, Captain Pitman was desirous to proceed on his voyage the same afternoon, in order to avoid lying idle in port all Sunday, the authorities most righteously, not permitting cargo to be worked on that day; but he found that the steamer's agents had engaged so much merchandise for her to convey to Fuh-chau, that it was impossible we could do so. He chafed at the delay; I rejoiced at it, for I was in no very great hurry, and wanted to obtain a peep at the town.

Amoy is situated in latitude 24° 10' north, longitude 118° 13' east, and has a population of about three hundred thousand. It was formerly a great military depot, and was commanded by a citadel on a height, with fortifications; but the British captured it in 1841, and the following year it was opened by treaty. The principal exports are crockery-ware, umbrellas, tea, sugar, sugar-candy, paper, tobacco

camphor, and grass-cloth. A large trade is carried on with Formosa, Siam, Japan, and the Lew-chew Islands. The leading foreign merchants have private residences upon the island of Kow-lean-seaou, which is a barren place, destitute of herbage; nevertheless, many fine mansions have been erected upon it, the most conspicuous of which is the United States consulate.

Soon after the steamer brought-to, I took passage in one of the host of native boats that instantly surrounded her, and landed on the bund, or quay, upon which spacious "go-downs" or warehouses stand. I then made my way to the only hotel in the city. An Englishman, Mr. Giles, whom I had met in Hong-Kong, was the proprietor, and accorded me a hearty welcome. When I told him that I wished to take a stroll through the town, he immediately volunteered to accompany me; so, having fortified ourselves with "soda and B.," we set forth on foot.

The streets through which we passed were very narrow, and not kept nearly so clean as those of Canton. Occasionally the foulest odors would assail our olfactory senses, and I could not help remarking to my friend that, in this respect, the city beat Cologne—world-renowned for its multifarious stench—hollow.

"Dead Chinamen don't smell very nice, I know; but I've become somewhat used to their peculiar fragrance, having lived here more than ten years. You see the natives hold their deceased relations in such high respect that they are loath to bury them, and often keep the putrefying bodies for months in the same rooms in which they themselves eat and sleep. I think this must necessarily be very deleterious, and I am sure that most of the pestilences that visit us emanate from this source; but you cannot convince a Chinaman that his deceased ancestor would harm him for paying this tribute to his *manes*," said Mr. Giles.

I was well aware that it was the universal custom in the "Middle Kingdom" for a man, when approaching "the sear and yellow leaf," to purchase a coffin and to keep it ready for use, though he has every prospect of living very many years longer, but I had never before heard of its being usual to retain a corpse *en famille*; and I doubt much whether I should relish my dinner if I partook of it while seated upon a loosely-closed sarcophagus containing the decaying remains of even my dearest friend of the past. But the Chinese are a peculiar people, to say the least.

While making our way toward the dock, which I had expressed a desire to visit, we encountered a mandarin, a sedate old gentleman with little scintillating eyes and a long gray goatee, who was riding a diminutive white pony. He was attended by a large retinue, and was on his way to the *yamun*, or hall of justice. I doffed my hat as he passed, and received a very courteous salutation in return. The streets were crowded with people and "curs of low degree;" in fact, all Chinese towns swarm with dogs, ugly, yelping curs, not fit to be eaten; but there was also a great number of pigs, one of which—a terribly mangy brute—ran furiously between my legs, and would have succeeded in capsizing me in the mud had I not saved myself by clutching the garments of an elderly lady who was walking ahead of me. That old woman had a voluble tongue, and she anathematized me until I had given her a few copper *cash*, when she dexterously changed her curse into a blessing. In course of time we arrived at the dock, which is a large and finely-finished structure built of gray granite; it belongs to a European company, and, I was informed, pays well. Not wishing to retrace our steps through the miry streets, we chartered a boat to convey us round to the hotel, where I dined and played billiards until nightfall, when I returned to the *Undine*.

The following afternoon I determined to visit the environs of Amoy, and the second officer agreed to accompany me. Mr. Punchard had been trading on the coast for several years, so was well fitted to fill the position of cicerone. After landing on the bund, we proceeded to the residence of a *má foo* (horse-keeper), and, when the proprietor presented himself, requested him to supply us with the two best steeds his stable contained. The stable (*ma fang*), was a rickety, tumble-down old place, not much larger or cleaner than a Celtic pigsty; but the owner entered it with a dignified air, and returned shortly afterward leading by the bridle an animal that looked like a lineal descendant of Don Quixote's Rosinante. It was a white pony, about twelve hands high, and Heaven only knows what age; its bones seemed to be on the verge of protruding through its skin; its fetlocks were covered with long, unkempt hair, and a *gan*, or native saddle,

formed of wood covered with cloth, rose about twelve inches above its back.

"I can never ride on that thing, Punchard; I could not balance myself," I exclaimed.

The owner evidently guessed by the tone of my voice that I was speaking disparagingly of the *ménage*.

"*Nê chek má hîng tuk noy*" (This horse can travel a long time), he said, regarding the animal with admiring eyes.

"We must make the best of it," said my friend, with a sigh, as a diminutive urchin led forth another pony, an exact counterpart of the first, save his color, which was dusky brown.

Accordingly, we mounted and set forth, accompanied by a *seaou keae*, or foot-boy, whom we told to direct us to the race-course. I felt conscious of looking idiotic, and did not consider myself very safe for the first half-hour, as we had to ascend and descend many very steep flights of steps, and I feared a dislocated vertebra if my steed should chance to slip; but both our animals were very sure-footed, and at last we emerged into the open country, not far from the race-course. The track is not a very fine one, but the foreign merchants in Amoy had made it as near perfection as possible in that out-of-the-way place. Far away, in the midst of a grove of umbrageous trees, we espied the gleaming spires of a Joss-house (*meaou*, a temple, in the vernacular; the term "Joss," generally applied by foreigners, is probably a corruption of the Portuguese word "Dios," God), so we urged our ponies to a trot, intending to visit it.

Our guide conducted us to the chief portal, and we dismounted at the foot of a flight of marble steps that led up to it. Passing under an archway, we entered a spacious court-yard, and were met by the *ta-sze*, or priest, whose special duty is to receive visitors. At my request, this functionary introduced us to the *ho-shang*, or high-priest, a close-shaven, venerable old gentleman, who, to my surprise, spoke the French language fluently. He was most courteous, and gave us a cordial welcome, ordering fruit, tea, and wine, to be brought immediately. In the course of conversation, I learned that he had formerly travelled with a French Jesuit in the interior of China, and had so acquired his knowledge of a Western tongue. The weather being warm, we did not much relish the tea, which, as is customary in China, was served scalding hot; but the fruit was very delectable. The kinds presented to us were: the le-che (*lichî dinocarpus*), tow-yew (*pumelo*), and orange. This last-named esculent attains its greatest perfection in China, but the natives have no generic name for it. The light-skinned, or coolie orange, is *tsang-tze*; a loose-skinned orange, vulgarly called "loose-jacket," *kan-tsze*. *Kin-keih* is a small, oval orange, used for preserves. To this species they compare the dissipated youth of rich people, and call them *kin keih tsee te*, "golden-orange youths," of which the skin (*pe tien*) is sweet; the kernel (*kih koo*) is bitter; and the pulp (*nang swan*) sour. On the twenty-fourth of the twelfth moon, poor and rich all offer this orange as an annual thanksgiving to the spirit that presides over the kitchen-fire.

Our entertainer, who belonged to the sect of Buddha (*Fûh Kaeou*), was a highly-intelligent man, and discoursed with us upon various topics of interest. When we had rested ourselves, he conducted us through the halls of worship, which, however, were not of sufficient magnificence to merit an elaborate description. A few peasant-women were performing their diurnal devotions before a shrine. On our approach, they arose quickly, and would have fled in dismay—doubtless considering the deity they wished to propitiate would be furious on beholding a *fan-gwei* (foreign devil) in his sanctuary—had not our sacerdotal friend bidden them remain. The incense (*hiang*), burning on the altars, filled the chamber with a disagreeable odor, and I was glad when the kind bonze led the way into the gardens, and we were able to breathe again the pure air.

The summer being nearly over, the choicest specimens of Chinese horticulture were not in bloom; yet the tastefully-ornate gardens, laid out in *parterres*, presented a gay and beautiful appearance. The flowers that chiefly attracted my attention were the mallow, passiflora, an orchid known as *Shih-seen-taou*, two varieties of the olea fragrans, one species of amaranthus, and the *serissa foetida*. There were pools devoted to the culture of the sacred nelumbium; but, as "the queen of flowers" blossoms in the spring, we could only admire the broad, bright-green leaves that sheeted the silvery surface of the water.

By the time we had finished our survey, the lengthening shadows warned us to depart; so, bidding adieu to the kind-hearted and urbane priest, we mounted our ponies, and turned their heads homeward.

When we arrived near the outskirts of the town, my companion proposed that we should take a short cut to the bund, so we delivered our steeds to the juvenile servitor, and proceeded afoot. While passing through a street close to the harbor, a Parsee merchant, who was acquainted with Punchard, leaned out of a window of his house, and requested us to enter. We accepted the invitation, and soon found ourselves ensconced in a very richly-furnished apartment, placidly sipping sparkling Moselle, a beverage that seemed to us like nectar, for we were hot, dusty, and thirsty.

There are a great many Parsees in China, most of them very wealthy men; but the natives despise them for their effeminacy, and prefer to trade with Americans and Europeans, in whom they can place greater reliance in matters of business. By the time we reached the Undine, the sun had sunk in a blaze of glory behind the western hills, whose violet crests stood clearly defined against the still crimson-amber-tinted sky.

At noon, the following day, Captain Pitman came aboard, and gave the order to weigh anchor. Soon the clinking pawls of the capstan mingled their chimes with the wild, sonorous refrain of the Malay sailors, and in a little while the pretty Undine steamed majestically through the channel between Que-moy and Brothers' Islands, and once more headed up the coast.

Early the next morning, we passed the Lam-yits; at eight o'clock, the White Dogs—which lie in the immediate vicinity of the pilots' cruising-ground—and, an hour after, crossed the bar at Sharp Peak, and entered the river Min, upon which, twenty-eight miles from where it disembogues into the sea, is situated the city of Fuh-chau-fu. For a distance of about sixteen miles from its mouth, the Min flows through a deep gorge, or cañon, the sides of which are in many places vertical cliffs, which are always covered with bright verdure. Amaranthaceæ and trailing plants, of numberless variety, sway pensile above the rapid-rushing river, beneath whose silvery surface lie numerous rocks and shoals, that have proved the ruin of many a stately ship. Carefully, up the flexuous stream, the Undine pursued her way, until, as if by magic, the gorge opened, and revealed a fleet of vessels lying at anchor in a broad harbor, formed by the expansion of the river over the lowlands. The Min is not navigable for vessels above this point, which is called the "pagoda anchorage," deriving its name from a *kuang tã*, or plain-spined pagoda, that stands upon the apex of a verdure-clad hill on the north shore, where an hotel and the residences of a few foreigners are situated. Captain Pitman moored his vessel in close proximity to the Mahamoodie, an opium-receiving ship, belonging to Messrs. Jardine, Matheson & Co., the leading merchants in the East, and then took me up to Fuh-chau-fu in his gig. The scenery, along the north bank of the river, is very fine, the highlands being thickly wooded; but paddy-fields line the opposite shore, and these do not always exhale a pleasant odor. After running on several sandbanks, we at last reached the city, and disembarked at a wharf just below where a stone bridge spans the stream.

Fuh-chau-fu, which ranks in the third grade of cities in China, is surrounded by an amphitheatre of hills, and enclosed by castellated walls between nine and ten miles in circuit, outside of which are extensive suburbs. The whole is commanded by a fortified hill, five hundred feet above the plain.

Chinese cities differ but little in appearance; the streets are uniformly narrow, and the shops fac-similes of each other; the prosperity of a place, however, as well as its political status, is generally indicated by its cleanliness, the order prevailing, and the garb of the citizens. Fuh-chau-fu is the chief tea-emporium in the province of Foh-Kien, and the amount of that commodity annually exported to Europe and America is enormous. The well-known and favorite Bohea tea (*woo e cha*) is cultivated upon hills—from which it derives its name—which lie about forty miles to the westward of Fuh-chau-fu. The first picking, which consists of the young green leaves of the shrub, takes place in April, and very little of this ever leaves the country. The second gathering is in June, and this growth is largely exported, as is also the third, necessarily of inferior quality, which is picked late in August. A fleet of the finest clipper-ships in the world almost simultaneously leave the pagoda anchorage for London early in June every year; and, as the first vessel that arrives at the port of destination receives one pound sterling per ton premium on her freight, a most exciting contest ensues between them. Only a few years ago, three "flyers," the Serica, Taeping, and Ariel, left Sharp Peak on the same day, parted company the next, and never saw each other again

until they reached the English Channel, up which they raced, almost abreast, to the Downs—a splendid termination to a race that extended over a distance of more than thirty thousand miles!

Only a small quantity of silk is exported from Fuh-chau ("fu" merely designates its rank as a city), the greater portion of this fabric being manufactured in the northern provinces. It is estimated that fifteen hundred worms yield their lives in producing one pound of silk, and a mulberry-tree, ten years old, will barely supply food for as many as will yield seven pounds. The principal imports are T. cloths, long-ells, woollen fabrics, lead, bird's-nests, and opium. The bird's-nests are brought from the Indian Archipelago, and are the product of a small, brown swallow (*Hirundo esculenta*), that congregates in large numbers about Croee, near the south end of Sumatra. As to the exact formation of these nests, naturalists differ; some supposing them to be the result of a glandular secretion, others averring that they are built of a peculiar kind of sea-weed. When cooked, they are very mucilaginous, and their nutritious virtues are held in such high esteem by the Chinese, that they have become a most important article of commerce. They weigh about half an ounce each, and resemble a small saucer in shape, with one side flattened, by which they adhere to the rocky sides of caverns. Their texture resembles that of isinglass or fine gum-dragon. When about to be used, they are soaked, then pulled to pieces; and, after being mixed with ginseng, are put into the body of a fowl, which is stewed all night with a sufficient quantity of water. When dissolved in broth, they impart to it a delicious flavor. The best kinds—such as are white and transparent, and of uniform and delicate texture—sell at eight thousand dollars a picul, or sixty dollars a pound.

The use of opium in Fuh-chau is excessive, and, despite the high duty exacted, large quantities are yearly imported from India, where, under a government monopoly, it is extensively cultivated. It is imported in a crude state, and the Chinese reboil it in copper skillets, reducing it to the consistency and color of tar, in which state it is ready for consumption. The opium-pipe is a hollow bamboo, shaped like a flute, having an ivory mouth-piece, and at the other end a small, silver globe, with a narrow perforation at the top. The smoker extends himself upon a couch, on which is placed a small lamp, the vessel containing the drug, and other paraphernalia. Dipping an instrument like a knitting-needle into the opium, he twists it in the viscous compound, until a portion about the size of a pea adheres to the end; he then holds this in the flame of the lamp until it swells into a diaphanous bladder, when he inserts it in the orifice of his pipe-bowl and inhales the odorous vapor it produces. About five whiffs finishes the charge, eight of which are sufficient to send the most experienced smoker into a comatose state, which is very delectable; but what feelings of utter wretchedness supervene, only those who, like myself, have been foolish enough to try it, can tell! Of the deleterious effects of this potent narcotic, I need not speak.

Specialties among the many *curios* to be found in the shops of Fuh-chau are the pretty ornamental pagodas and chessmen, carved out of soap-stone (*kuã shih chay*); and also bracelets, made of the seeds of *kin-kang-tang*, strung together.

The city appeared to me to be well governed, and foreigners could perambulate the streets without the slightest fear of being subjected to insult. The most common punishment for petty offenders is the *cangue*, a heavy, square frame of wood, through a hole in which the prisoner's head is thrust, and he is compelled to promenade the streets, bearing upon his shoulders this symbol of disgrace. *Choo keuë*, capital punishment, generally performed by beheading, is meted out to those convicted of high misdemeanors; but for treason and state offences the criminal is subjected to the penalty of *ling chu*, a slow and ignominious death, the victim being cut to pieces.

One of the strangest anomalies in the Flowery Kingdom is the matrimonial law, which, while it sanctions polygamy, and gives the children of concubines equal rights of inheritance with those of the first and of course the more legitimate wife, nevertheless, to a certain extent, discountenances the marriage of women who have lost their husbands by death. Young widows, who remain unmarried a second time, are called *tsing tsüë*, and, as a mark of honor, the emperor confers upon them a doorway, upon the lintel of which is written, "*Tsing-tsüë lau fang*."

Foreign residents in the East are always hospitable. The gentleman at whose house I stayed, during my brief sojourn in Fuh-chau, devoted himself most energetically to the task of showing me every

place and thing of interest in the city; and so pleased was I with the entertainment he provided for me that I was loath to leave when Captain Pitman called to take me aboard his ship. Of our passage down to Hong-Kong I shall not speak, for nothing worth recording occurred during it; I need only remark that, when I found myself once more upon the isle of "Fragrant Streams," I felt to the full how much I had enjoyed my trip up and down the east coast of China.

WALTER A. ROSE.

"THE DEVIL'S HOLE."

THE stream meanders many a mile,
By velvet meadow and rustic stile;
Past cottage-gable and village-spire,
And maids in holiday attire;
O'er shallow reaches of shining sand,
Where patient cattle lingering stand,
Pallidly gleaming beneath the moon,
Glowing like gold when the day is done.

But under the shade of a shaggy bank
Lieth a hollow, dark and dank.
Alders, fringing the other side,
See themselves in the sluggish tide.
Above rises the wooded hill,
Haunt of the owl and whippowill.
No eye has pierced to the depths below,
Where stealthy currents come and go;
But the pool has many a secret dread,
Many a tale of the early dead,
Who, plunging down in its shadows gray,
Returned no more to the light of day;
Many a shriek and gurgling moan,
Many a bleached and crumbling bone.

What mysteries more its shadows hold,
Never to mortal man were told;
But the stoutest diver shuns the leap,
And the swimmer turns with a wary sweep.
In the glare of noon, and the morning gray,
And the mellow flush of the dying day,
It lieth there like a guilty soul,
And rustics call it "The Devil's Hole."

Our life flows gayly and gladly on,
In the summer breeze and the summer sun;
But somewhere under a shaggy bank
Lieth a hollow, deep and dank,
Where the eddies wheel in a serpent-coil,
And the turbid waters ceaseless toil,
Striving to drag their helpless prey
Forever down from the light of day.
Sin and Sorrow and Shame are there,
With baleful visage and demon glare—
Strive, swimmer, strive for thy perilled soul;
None cometh out from "The Devil's Hole."

W. H. BARCOCK.

BORES AS ACHIEVERS.

TO be a bore is to be a social pariah. Perhaps there is nothing so proud and sensitive soul would not rather be; and yet only supreme egotism and self-love make a bore possible. Mortals of the artesian sort are hated alike by gods and men. Everybody dreads, everybody avoids them; and, from the very terror they inspire, they achieve results which the noble and generous would never seek to attain. A bore, though he is avoided as a pestilence, flourishes like a rank weed. Humanity flies from him, for it knows that to stand is to be overborne, and that to grapple is certain defeat. Upon his power of repulsion the bore calmly calculates, knowing that all he reaches must become his victims. He is the very devil-fish of society, as Hugo describes the monster, sparing nothing he can once

get within his grasp. He has his uses, no doubt, but, unlike the uses of adversity, he is not sweet. Nature must have created him in malignant mood to revenge herself upon the few for the shortcomings of the many. The whole world is his field; no temple so hallowed that he will not enter; no altar so sacred that he will not profane.

Bores are of all nations, omnipresent and immortal. When the Pyramids were building, Cheops must have been haunted and harried by bores, resolved upon giving him the benefit of their architectural ideas. Noah himself, if we are to receive the common account, was unquestionably annoyed by predictions of failure in his first attempt at navigation. We know how Romulus treated Remus for boring him about Rome, and we have always regretted that his fate has not proved a wholesome corrective to his class.

Bores, though of every variety, may be divided into two great species—the innocent and the designing. The former make rankling wounds, though seemingly slight ones, and add untold horror to daily life. They are the accursed of Fortune, and the mischief they do is incalculable. We leave them to the avenging deities, and content ourselves by grappling with the conscious offenders. It is these who defeat the ends of justice; turn good resolutions awry; drive the best intentions on dangerous rocks. Devoid of sensibility, principle, or conscience, they bring all their obnoxious presence and their entire energy of perforation to bear upon the objective point, usually a good-natured, kind-hearted man who regards the death of Narcissus as the most terrible of calamities. Rather than so suffer, he will consent to or perform any thing, holding that no law, human or divine, should compel a man to social crucifixion. Fortunately for the bores, it is as human to be bored as it is diabolical to bore. They understand that even demi-gods may be brought down to earth, and made to endure the agony of the meanest mortal, if once subjected to their process of martyrdom. They were the ancient augurs of pagan Rome, and they left an unlimited progeny.

Bores, insensible as they seem, have a clear insight into the mysteries of human nature, and select at a glance their predestined victims. They make demands which at first shock, and are then pronounced monstrous. But the demands are iterated in varying form day after day, until he who declared them impossible grants them to the fullest, and thanks Heaven devoutly for his final alleviation. There is hardly any thing under the sun a bore may not achieve. He goes about like a roaring lion, seeking whom he may devour, and he devours whom he seeks. Though worthless, disreputable, and notoriously dishonest, he compels the weak and worries the strong into recommending him to places of dignity and trust; into endorsing him as a gentleman of probity and character; into inviting him to a formal dinner or a confidential breakfast, and into lending him money, though they may have sworn upon all the evangels that to borrow of them was not in mortal power.

The bore makes improbabilities commonplace, and things deemed impossible of daily occurrence. With a sublime egotism which destroys all nicety of perception, he goes everywhere, calls on everybody, demands every thing. To fitness of time, place, or circumstance, he is absolutely obtuse; for he is absorbed by his purpose, and bent upon its fulfilment. He is heroic in his forgetfulness of the smallest and greatest proprieties; would be sentimental to a mathematician, and discuss the grandeur of the Infinite before the father of a starving family. He would seek to show the truth of Hobbes's reasoning to a country Calvinist of the deepest blue, and would suggest leap-frog as a post-prandial recreation if he sat at the right hand of the Czar of all the Russias. He is a miracle of impudence and pertinacity under circumstances the most adverse, and in the face of opposition the most obstinate. He makes it clear as Venus at midnight, that, to the creature who will be neither rebuked nor rebuffed, any object this side of the superhuman may be gained. He wraps himself in the panoply of stolidity and selfishness, and fights for the eternal Me to the bitter end.

When we find that men we have esteemed and honored have violated their best and truest nature, and given the lie to the lesson of their lives, let us be charitable, and believe that some invisible and invincible bore has wrought the wondrous change. He jests at scars who never felt a wound; and by him who has not been bored the finest tortures of existence can only be imagined. The doctrine of total depravity and original sin may have firm basis after all. The totally depraved are the bores, and the original sinners are the bored.

JUNIUS HENRI BROWNE.

PICTURESQUE AMERICA.—MAUCH CHUNK AND MOUNT PISGAH.

PICTURESQUE AMERICA.—MAUCH CHUNK FROM FOOT OF MOUNT PISGAH.

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

IV.

DINING A LA TURQUE.

THE mid-day *siesta*, which occupies the hours from twelve to two, and in which all but the laboring poor indulge—for it is one of the fixed institutions of the entire East—is over, and we rejoin our host.

He claps his hands, and obsequious slaves enter with small trays, on which are very small wineglasses, containing what seems to smell and taste like aniseed-cordial, only more fiery. This is *raki*, the fermented juice of the date, which is used as an appetizer, an equivalent for our ante-prandial bitters, and a very good substitute too.

Nebeet (wine) is prohibited by the Prophet—but this is not considered wine, though the stricter Mussulmans avoid all stimulating potions, with the exception of coffee.

With watering eyes and burning epigastrium, we await the further proceedings of our princely host, who smilingly observes:

"You know, my mode of dining, if not of living, is usually *à la franque*; but, as you naturally do not desire to dine at Cairo as you would at Paris or London, I have ordered this day's dinner to be served *à la turque*, and trust you may like it."

We smile approval, and express our thanks in the fittest words we can find for the thoughtful kindness which has led to a deviation from the prince's ordinary habits, solely for the pleasure of his guests; and the prince again claps his hands, when two sable Nubians enter, draw into the middle of the apartment one of the pearl inlaid *souffras* (stools), and arrange four cushions around it for seats. On these cushions, in imitation of our host, we all squat down in tailor-fashion, our legs tucked under us, intrepidly braving prospective cramps in our knee-joints, not supple, like those of Orientals, from long practice. We have not long to wait. A slave approaches with a graceful-looking ewer of silver in one hand, and a basin of the same material in the other, the bottom of the latter raised and perforated internally, while over his arm are hung the fleecy-looking towels known as Turkish even here.

Over the hands of each of us he pours the perfumed water, so that we may lave face and hands in the running stream—for no Oriental ever washes otherwise, nor takes the water his hands have already soiled to cleanse his face.

When we have finished this ceremony, and dried our hands on the spongy towels, the slave sprinkles a little perfume over them and retires, and the prelude to dining is over. Then enters another servant, the butler of this *ménage*, bearing small bowls of soup highly seasoned, which he places before each guest, with a quaint spoon whose handle is of pearl, and bowl of tortoise-shell.

Our host swallows his soup with as much noise as possible—this being an indication of relish, and considered quite the correct thing—while the strangers more silently absorb their portions. The bowls removed, the attendants—one of whom stands behind each guest—place before each person a small, round piece of bread, much resembling india-rubber in color and consistency, about the size of a breakfast-plate, and intended as a substitute for that article. We glance around for knife and fork, but none are visible—not even a Chinese chopstick; but glancing at our host, and observing that he rolls up his right sleeve high above the wrist, with Chinese imitateness we do likewise, only overdoing it by rolling up both.

No Oriental ever uses the left hand in conveying food to his own mouth, or in handing it to a neighbor. The left hand is considered unclean, and many a foreigner unconsciously insults a native by tendering him food or pipe with that obnoxious and interdicted member.

The opening dishes of the repast, which are placed separately and *à la carte* on the table, are provocatives to hunger, such as olives, caviare, and various native preparations, whose names and composition the cunning cooks who compound them alone could reveal. Suffice it to say that they are fearfully and wonderfully made, and either very sweet or sour. Colored drinks, pink, rose-colored, and green, of *orgeat*, strawberry, or other fruits, are then handed round, and imbibed with a hissing sound; and, the light skirmishing being now over, the serious action commences. And serious, indeed, it is, to dine with "a high Turk," or, indeed, with a less elevated one,

for their canons of politeness are no less burdensome than the number and variety of condiments the stranger is pressed and expected to consume. To refuse a dish is not etiquette, and not to eat heartily and with great apparent relish of each brings grief to the heart of your host, who plaintively reproaches you with it, and will only be satisfied with your stuffing yourself while any spare nook of space is left in your interior.

Carving your portion of the dish with his own fingers by deftly tearing off large flakes from breast of lamb, or dislocating with the same ready instrument leg or wing of poultry or game, your attentive host watching his opportunity, whisks into your open mouth a pellet of rice-pillau, or choice titbit, and would be astonished to know the effort it causes you to refrain from spitting it out again.

The cookery is really good, and the variety of dishes overpowering; while in sauces—that mystery to all Anglo-Saxon races—the Arab cook rivals, if he does not surpass, his great Gallic successors in the art of "making man happy" and "keeping him so." One *pièce de résistance*, frequently seen at formal dinners, is indeed worthy of that name. An attendant staggers in, bending under the weight of a sheep roasted whole—nothing but his wool removed. Placing him before the host, he then retires. The master of the house eyes his antagonist all over, as though meditating where to attack this motionless bulk; then hitching up his right sleeve a little higher, and grasping with his left hand one leg of the lamb, tears it apart, revealing no hollow void, or savory stuffing, but an entire turkey ensconced therein!

When the rage of hunger has been partly satiated by the lamb, the turkey is assailed in a similar manner, and, on his being torn apart, he, like Shakespeare's justice, is found to have his "fair round belly with good capon lined." Within the capon is stowed away a roasted pigeon, within the pigeon an egg, and inside of the egg is a ring, which is presented to the guest as a *souvenir* of the entertainment.

No less than a dozen dishes follow each other in rapid succession, until the pillau of rice crowns the solid portion of the repast; and then follows a succession of pastry, sweets, and fruits—with sherbets and colored drinks interspersed—until eyes, stomach, backbone, and knee-joints, ache in unison at the protracted *seance*.

Before commencing, the host says grace softly to himself. It is but a single word: "*Bismillah!*" (In the name of God!) and then, turning to the guests, he adds: "*Taffuddal!*" (Honor me by partaking). The host commences eating first, and the rest follow his example.

The guests, if natives, all actually eat out of the same dish, dipping their pieces of bread into the gravy, or doubling them up, and picking up fragments of the meat between them. When Europeans dine, each is served on his separate piece of bread, as though it were a plate. Frequent references to this Oriental habit of eating out of the same dish are to be found in the Scriptures, as where, in Matthew xxvi. 23, Christ and His Apostles are represented as so doing. The meats and poultry are so cooked as to facilitate this style of carving and eating; a favorite dish being *yaknu*, or stewed meat chopped up with vegetables; another, the famous *kebab*, so often mentioned in "The Arabian Nights"—simply morsels of mutton, roasted on skewers of sticks, and well peppered. Tender young vine-leaves, containing rice and meat chopped up fine and highly seasoned, make a most appetizing dish. Vegetables, in great variety, are also given. Boned poultry is common. As in Germany, sweet dishes are often mixed with the meats, and even the two cooked together.

The slaves stand behind the guests while eating, each holding in his hand a *goolah*, or porous earthen jar, of Nile-water, or a bowl of *khoosaf* (water with raisins boiled in it) sweetened, with which they supply the small bowls which serve for glasses.

As soon as each person has finished eating, without waiting for the others, he mutters his grace after meat—"Elham doo-lillah!" (God be praised!)—rises up, washes his hands and mouth, as before—the slave pouring out the water for him—and retires to a divan.

Each time a person drinks, the friend sitting next him says: "*He-nican!*" (May it benefit!) to which the reply is: "*Allah Yoh-neak!*" (God benefit thee!)

When sherbet is handed round, it is served in gilt glass cups placed on a round waiter, and covered over with a piece of scarlet silk, stiff with embroidery. The servant who bears the tray has hanging from his arm a long, narrow, damask napkin, with a golden fringe and a silken border, used for wiping the lips after drinking. The guests then adjourn to the divans; pipes and coffee are brought in; the tray and the relics of the feast are taken away, and all enjoy post-

prandial *keff*, or ease, smoking the pipe of contentment on the divan of repose—the only sounds which break the silence being the slumberous murmur of the *nargile*, or water-pipe—for there is little if any conversation. Your high-bred Oriental is not a loquacious animal—deeming much talk undignified and womanish; and, having very little to say to strangers, he says it—trusting to food, pipes, and coffee, to fill up the void.

Indeed, after eating, as he is a heavy feeder, he is apt to be somnolent, leans back well on the cushions of his divan, and slowly inhales deep draughts of *tumbak*—the Persian weed—from his bubbling water-pipe, until its long, snake-like coil slips from his relaxing grasp, and the stately head droops upon his silken vest in soothing slumbers.

When he awakens, you take your cue gracefully to ask his permission to retire. He urges your longer stay—at least you must take a final *chibouque* and a parting cup of coffee. It is not etiquette to refuse, so you smoke and sip—then rise again. Again he presses you to remain. But now you are positive—you must go! Then ensues a trial of courtesy between host and guest. Salutations when you rise up; salutations at the door of the apartment; at the head of the stairway; at the foot of the stairway; your host accompanying you—and, as the door closes, all performed without exaggeration and with a polish and an ease of manner which no Parisian could surpass.

THE FAMOUS DEAD OF 1870.

ABERDEEN, GEORGE HAMILTON GORDON, Earl of (Scottish earl), Viscount Gordon, lost at sea in August, in voyage to Australia, aged 29.

ALDEN, Colonel Bradford R., U. S. A., a distinguished army officer, almost forty years in the service, died at Newport, R. I., September 10, aged 60.

ANDERSON, Dr. Alexander, the father and pioneer of wood-engraving in the United States, died in Jersey City, N. J., January 18, aged 95.

ANSCHÜTZ, Karl, a musical director and composer, born in Germany, and conducted operas, orchestras, and concerts, in Germany, Holland, Great Britain, and United States, died in New-York City, December 30, aged 58.

ASHMUN, George, a Massachusetts lawyer, orator, and politician, M. C. from 1845-'51, died in Springfield, July 17, aged 66.

LUCKLAND, Robert John Eden, third Lord, Bishop of Sodor and Man, 1847-'54, Bishop of Bath and Wells, 1854-'69, died April 25, aged 71.

BACON, Hon. Ezekiel, oldest graduate of Yale College (class of 1794), died in Utica, N. Y., October 18, aged 94.

BAILEY, Samuel, English metaphysician, politico-economist, and banker, died in Sheffield, Eng., January 18, aged 82.

BAIRDWIN, Rev. Theron, D. D., Congregational clergyman and author, Secretary Western-College Society, died in Orange, N. J., April 10, aged about 45.

BALFE, Michael W., a musical composer and vocalist, author of "The Bohemian Girl," died in Dublin, October 20, aged 62.

BARNES, Rev. Albert, D. D., a distinguished Presbyterian clergyman and author, whose commentaries on the Bible have reached an immense circulation, died in Philadelphia, December 24, aged 72.

BARRY, John S., a native of Vermont, Governor of Michigan, 1850-'52, State Senator, 1834-'38, 1840-'42, died in Constantine, Mich., January 15, aged 68.

BARTLEY, Mordecai, an active Ohio politician, M. C., 1823-'31, Governor of Ohio, 1844-'46, died in Mansfield, October 10, aged 84.

BASINI, Carlo, an eminent musical composer and teacher of music in New York and Brooklyn, died in Irvington, N. J., Nov. 26, aged 58.

BEDFORD, Gunning S., M. D., physician, professor, and medical writer, died in New-York City, September 5, aged 64.

BELL, Joshua F., a Kentucky politician, M. C., 1845-'47, member of the Peace Convention of 1861, died in Kentucky, August 17.

BERRI, Marie Caroline Ferdinande Louise de Bourbon, Duchess de, mother of the Count Henri de Chambord, the legitimate claimant of the French throne, died at Brunsee Castle, Styria, April, aged 72.

BÉRIOT, Charles Auguste de, a celebrated Belgian violinist, professor, and composer, died in Brussels, April 12, aged 68.

BLAKE, Hon. William Hume, LL. D., an eminent Canadian jurist, Chancellor of Canada till 1862, professor of the Law University of Toronto, died November 15.

BONALD, Louis Jacques Maurice de, Cardinal, Archbishop of Lyons, Senator of France, born at Milhau, October, 1787, Bishop of Chartres, 1817, of Puy, 1823, Archbishop of Lyons, 1839, Cardinal, 1841, Senator, 1852, died at Lyons, February 26, aged 82.

BONAPARTE, Jerome Napoleon (Patterson), son of Jerome Bonaparte, died in Baltimore, aged 65.

BOURBON, Enrique Marie Ferdinand, Prince of, brother of the ex-king consort, and cousin of the ex-Queen Isabella of Spain, born 1823, killed in a duel by the Duc de Montpensier, near Madrid, March 12, aged 47.

BRESEE, Rear-Admiral Samuel L., U. S. N., a naval officer, sixty years in the service, actively engaged in the War of 1812 and Mexican War, Rear-Admiral in 1862, on the retired-list since 1867, died near Philadelphia, December 17, aged 76.

BROGLIE, Achille Charles Leonce Victor, Duc de, a French statesman, born November, 1785, Cabinet Minister, 1830-'36, died in Paris, January 27, aged 84.

BROCKWAY, John H., lawyer and politician of Connecticut, State Senator, 1834, M. C., 1839-'43, died in Ellington, Conn., July 29, aged 70.

BROOKS, William T. H., Maj.-Gen. Vols., a graduate of West Point in 1841, an officer of merit in Florida, Mexican, and late Wars, died at Huntsville, Ala., July 19, aged 50.

BROUGH, William, an English comedian and humorist, dramatic writer, died in England, March 13, aged 48.

BRYAN, Thomas Jefferson, a liberal art-connoisseur, the giver of a gallery of paintings to the New-York Historical Society, died at sea between Havre and New York, May 14.

BURLINGAME, Anson, LL. D., statesman and diplomatist, born in New Berlin, N. Y., November, 1822, M. C., from Massachusetts, 1855-'61, Minister to Austria and China, 1861-'67, Ambassador, China, 1867-'70, died at St. Petersburg, February 23, aged 48.

BURNET, David G., born in New Jersey in 1790, engaged in South American and Texas Revolutions, President of Texas, elected U. S. Senator from Texas, died in Galveston, Texas, December, aged 80.

CARTER, John C., Commodore U. S. N., forty-five years in service, died in Brooklyn, N. Y., November 24, aged 65.

CHALMERS, Rev. Peter, D. D., clergyman of the Kirk of Scotland, an antiquarian author, died at Dunfermline, April 12.

CHAMPLIN, Stephen, Commodore U. S. N., the last survivor of the commanding officers of the battle of Lake Erie, died in Buffalo, February 20, aged 80.

CHASE, Rt. Rev. Carlton, D. D., Episcopal Bishop of New Hampshire, born February, 1794, educated at Dartmouth College, graduated class of 1820, Rector at Bellows Falls, Bishop, 1844-'69, died at Claremont, N. H., January 18, aged 76.

CHAUVENET, William, Ph. D., an eminent mathematician, astronomer, author, and professor, of St. Louis, died at St. Paul, Minn., Dec. 13.

CHICHESTER, Rt. Rev. Ashurst Turner Gilbert, D. D., Bishop of an Anglican clergyman and prelate, formerly Vice-Chancellor of Oxford, died at Chichester, February 22, aged 84.

CLARENDON, Rt. Hon. G. W. F. Villiers, Earl of, K. G., G. C. B., Secretary of State for Foreign Affairs, died in London, June 26, aged 70.

CLARK, Sir James, M. D., an English physician and author, Physician to the Queen, died in London, June 30, aged 82.

COLES, Captain Cowper Phipps, R. N., inventor of the shields for protecting armored ships, lost on the Captain in the Bay of Biscay, September 7, aged 51.

CONY, Samuel, Governor of Maine, 1865-'67, a prominent politician, died in Augusta, October 5.

COPLAND, James, M. D., an eminent physician and medical writer, author of "Dictionary of Medicine and Pathology," died in London, July 15, aged 77.

COSTELLO, Miss Louisa Stuart, artist and author, of Irish birth, died at Boulogne, April 24, aged 71.

CRAIK, Rev. James, D. D., a clergyman of the Scottish Kirk, and an active educator, died in Glasgow, August 20, aged 68.

CRAMER, John, presidential elector of Thomas Jefferson in 1805, State Senator, 1823-'25, M. C., 1835-'37, died at Waterford, N. Y., June 1, aged 91.

CRESWICK, Thomas, an English painter, born in Sheffield, 1811, exhibited pictures in 1828, A. R. A., 1842, R. A., 1851.

CULLEN, Edward, M. R. C. S., Irish physicist, geographer, traveller, and author, died at Clontarf, Dublin, September 10, aged 51.

CUTLER, Elbridge Jefferson, professor of modern languages in Harvard College, literary critic and poet, died in Cambridge, Mass., Dec. 27.

CUTTING, Francis Brockholst, an eminent lawyer, M. C. from 1853-'55, died in New-York City, June 26, aged 65.

DAHLGREN, Rear-Admiral John A., U. S. N., forty-four years in service, died at Washington, D. C., July 12, aged 60.

DALE, Rev. Thomas, Canon of St. Paul's, poet, author, clergyman, and professor, died in London, May 15, aged 73.

DAWSON, John L., Democratic politician, M. C., 1851-'55 and 1863-'67, died in Fayette Co., Pa., September 18.

DEAN, Gilbert, a politician and jurist, M. C., 1851-'53, Judge of the Supreme Court of New York, 1853-'61, died in Poughkeepsie.

DEMIDOFF, Prince Anatole, a wealthy Russian nobleman and author, died in Paris, April 30, aged 58.

DICKENS, Charles, author and novelist, died at Gad's Hill, near Rochester, Kent, January 9, aged 58.

DUDLEY, Benjamin Winslow, M. D., LL. D., professor and author, most successful lithotomist in the profession, died in Lexington, Ky., January 20, aged 85.

DUMAS, Alexandre, a French author, the most prolific of modern novelists and dramatists, died at Dieppe, France, December 9, aged 67.

DURKEE, Charles, a statesman, born in Royalton, Vt., 1807, settled in Wisconsin, was a member of the Legislature from 1837-'38, M. C., 1851-'55, U. S. Senator, 1855-'61, Governor of Utah, 1865-'70, died in Omaha, January 14, aged 63.

ELLIOT, Thomas D., Massachusetts statesman, M. C. for six terms, died at New Bedford, June 12, aged 62.

ELTON, Rev. Romeo, D. D., LL. D., a Baptist clergyman, professor, antiquarian, and author, graduated B. U., 1813, died in Boston, February 5, aged about 80.

EVANS, Sir George De Laey, G. C. B., a British general, born in Ireland, 1787, actively engaged in American, Peninsular, Indian, and Crimean Wars, M. P. thirty years, died in London, Jan. 9, aged 83.

EWBANK, Thomas, C. E., an eminent engineer and writer on mechanical topics, English birth, died in New-York City, Sept. 16, aged 79.

FALCON, Marshal Juan Crisostome, President of Venezuela, 1865-'68, died in Martinique in May.

FARNUM, Bvt. Brig.-Gen. Joseph Egbert, Col. 70th Reg't, N. Y. Vols., a gallant soldier in both the late and Mexican Wars, died in New York, May 16, aged 46.

FARRAGUT, Admiral David Glascoe, U. S. N., the grandest hero of our naval record, died in Portsmouth, N. H., August 14, aged 69.

FARRAR, Mrs. Eliza W., an American author, widow of Professor Farrar, died in Springfield, Mass., April 22, aged 78.

- FIELD, Richard Stockton, U. S. Dist. Judge, N. J., 1863-'70, U. S. Senator, died in Princeton, N. J., May 25.
- FLAHAULT DE BILLARDIERE, August Charles Joseph, Comte, a French general under Napoleon I., diplomatist and senator, Grand Chancellor of the Legion of Honor, died in Paris, April 24, aged 85.
- FRENCH, Benjamin B., native of New Hampshire, but resident of Washington, D. C., since 1840, clerk House of Representatives, 1845-'47, Commissioner Public Buildings, 1847-'70, died in Washington, D. C., August 12, aged 70.
- FROTHINGHAM, Rev. Nathaniel Langdon, D. D., Unitarian clergyman and author, died in Boston, April 4, aged 77.
- GARDNER, Commodore William H., U. S. N., a naval officer fifty-six years in the service, on retired list since 1862, light-house inspector, died in Philadelphia, December 19, aged 70.
- GOLSON, William S., an Ohio jurist, Judge of Superior Court of Cincinnati, and Supreme Court of Ohio, died in Cincinnati, September 21.
- GOGGIN, William L., member of Virginia State Legislature, 1836, M. C., 1839-'45, and 1847-'49, died in Richmond, January 5.
- GOICOURIA, Gen. Domingo de, Cuban revolutionary leader for twenty-five years past, garrotted at Havana, May 7.
- GRANT, Rt. Rev. Thomas, R. C. Bishop of Southwark, London, died in that city, May 31.
- GREEN, James S., politician, born in Fauquier County, Va., removed to Missouri, 1837, member Constitutional Convention, Missouri, 1845; M. C., 1847-'51, minister to New Granada, 1853-'56, U. S. Senator, 1857-'61, died in St. Louis, January 19, aged 53.
- GREY, Gen., the Hon. Charles, private secretary to Queen Victoria, 1849-'70, one of the keepers of the privy purse, 1866-'70, and editor of the queen's books, died at Windsor, March 31, aged 66.
- GRIER, Robert Cooper, jurist, Associate Justice Supreme Court U. S., 1846-'70, died in Philadelphia, September 25, aged 76.
- HARDENBURGH, Rev. James B., D. D., a clergyman of the Reformed (Dutch) Church, and an author, graduated at Union College in 1821, died in New-York City, January 22, aged 70.
- HARPER, Joseph Wesley, publisher, third brother of the firm of Harper & Brothers, died in Brooklyn, February 14, aged 69.
- HARRO-HARRING, Paul, a Danish exile, adventurer, poet, novelist, etc., committed suicide in Isle of Jersey, May 15.
- HAWLEY, Gideon, scholar and philanthropist, regent of the Smithsonian Institute, died in Albany, August 20, aged 85.
- HAZARD, Samuel, publisher, historian, and editor, died at Germantown, Pa., May 22.
- HEATON, David, M. C. from North Carolina in XLth and XLth Congress, died in Washington, D. C., June 25.
- HERTFORD, Richard Seymour Conway, fourth Marquis of, an English nobleman of immense wealth, a connoisseur in art, died in England in August, aged 70.
- HERTZEN, Alexander, a Russian exile, revolutionist, and editor of the *Kolokol*, died in Paris, January 21, aged 54.
- HINMAN, Joel, LL. D., Chief Justice of the Supreme Court of Connecticut, 1861-'70, died in Cheshire, Conn., February 21, aged 68.
- HITCHCOCK, Maj.-Gen. Ethan Allen, U. S. V., Commissioner of Exchange of Prisoners, and author, died in Hancock, Ga., August 5, aged 73.
- HOAG, Truman H., M. C. from Xth (Toledo) Ohio Dist. in XLth Congress, 1869-'70, died at Washington, D. C., February 5.
- HOLLAND, Dr. Cornelius, a distinguished citizen of Maine, Member of the Constitutional Convention of 1819, M. C., 1831-'33, and many times a member of the State Senate and Assembly, died at Lewiston, Me., June 3, aged 88.
- HOPKINS, Benjamin F., born Washington County, N. Y., 1829; removed to Wisconsin; Governor's Secretary, member Wisconsin Legislature and Senate, M. C., 1867-'70; died at Madison, Wis., January 3, aged 40.
- HUTTON, Abraham B., LL. D., an excellent teacher and philanthropist, forty-eight years connected with and forty years President Pennsylvania Deaf and Dumb Asylum, died at Stuyvesant's Landing, N. Y., July 18, aged 71.
- HUYLER, John, politician and jurist, born in New-York City 1808, removed to New Jersey, 1846; member New-Jersey Legislature, 1850-'54; Speaker of New-Jersey Legislature, 1853-'54; Judge, Court of Appeals, 1854-'57; M. C., 1857-'59; died at Hackensack, N. J., January 9, aged 61.
- IRVING, Hon. Thomas, Judge of the U. S. District Court for Western Pennsylvania, died in Pittsburgh, May 13.
- JACOBSON, Rev. John Christian, D. D., a Bishop of the Moravian Church, long active and useful, died at Bethlehem, Pa., Nov. 24, aged 75.
- JOURDAN, John, Superintendent New-York City Police, died in New-York City, October 16, aged 43.
- KELLOGG, Mortimer, a chief-engineer U. S. N., entered service February 1852, killed in rencontre at Key West, Fla., November 16.
- KEMPER, Rt. Rev. Jackson, D. D., LL. D., Protestant Episcopal Bishop of Diocese of Wisconsin, and author, died at Milwaukee, Wis., May 24, aged 81.
- KENNEDY, John Pendleton, author, historian, M. C., Secretary of Navy, etc., died at Newport, R. I., August 18, aged 75.
- KING, Austin A., an eloquent lawyer and politician, Governor of Missouri 1849-'53, M. C., 1863-'65, died in St. Louis, April 22, aged 69.
- KINGSLEY, Rt. Rev. Calvin, D. D., Bishop of Methodist Episcopal Church since 1869; born in Oneida County, N. Y., Sept. 8, 1812, editor, author, and bishop; died at Beirut, Syria, April 6, aged 58.
- KINGSBURY, Rev. Cyrus, D. D., Presbyterian clergyman, missionary for nearly fifty years among the Creeks and Choctaws, died in the Indian Territory, June 27, aged 77.
- KUNTZE, Edward J., a sculptor born in Pomerania in 1826, emigrated to U. S., 1852, died in New-York City, April 10, aged 44.
- LA MOUNTAIN, John, a daring and usually successful aeronaut, died at South Bend, Ind., February 14.
- LAUNITZ, Robert E., a celebrated sculptor, of Russian birth, but forty years in this country, died in New-York City, Dec. 12, aged 64.
- LAWESTINE, Alexander Charles Anatole Alexis, Marquis de, a French general and senator, a grandson of Madame de Genlis, commander of the National Guard, died in Paris, May 1, aged 85.
- LEE, Robert Edward, LL. D., the late General-in-Chief of the Confederate Army of Northern Virginia, President of Washington College, Lexington, Va., since 1866, died at Lexington, Va., Oct. 12, aged 64.
- LEFTWICH, Dr. John W., a prominent citizen of Memphis, Tenn., mayor, President Chamber of Commerce, M. C., 1865-'67, died at Lynchburg, Va., in June, aged 44.
- LEMON, Mark, an English humorist and reformer, editor of *Punch*, and author, died in London, May 23, aged 61.
- LEOPOLD II., Jean Joseph Ferdinand Charles, Grand-duke of Tuscany from 1824 to 1859, when Tuscany became a part of the kingdom of Italy, died at Rome, January 29, aged 72.
- LONGSTREET, Augustus Baldwin, LL. D., an eminent jurist, clergyman, and author, president in succession of four Southern universities, died at Oxford, Miss., September 6, aged 80.
- LOPEZ, Francisco Solano, President or Dictator of Paraguay, 1862-'70, killed in battle near the Aquedavan River, March 1, aged 43.
- LORD, Rev. Nathan, D. D., LL. D., a Congregational clergyman and author, President Dartmouth College, 1829-'63, died at Hanover, N. H., September 9, aged 78.
- LUDLOW, Fitz-Ilugh, an American magazine writer and author, died in Geneva, Switzerland, September 13, aged 34.
- MATTEI, Marius, a Roman Catholic prelate, raised to the cardinalate in 1832; Bishop of Frascati, 1844; of Porto, 1854; and of Ostra and Velletri, 1860; Dean of the Sacred College, Arch-priest of the Basilica of the Vatican, and President of the College of Cardinals; died in Rome, October 8, aged 78.
- MCCLEINTOCK, John, D. D., LL. D., a Methodist clergyman, professor, and author, professor in Dickinson College, 1835-'48; Editor *Methodist Quarterly*, 1848-'56; pastor New-York City, 1857-'59; minister American Chapel, Paris, 1860-'65; President Drew Theological Seminary, 1867-'70; author "Theological and Biblical Cyclopædia," etc.; died at Madison, N. J., March 4, aged 56.
- MACLISE, Daniel, R. A., an eminent British historical painter, born in Cork, 1811, a member of the Royal Academy since 1840, died in London, April 26, aged 59.
- MAHAN, Rev. Milo, D. D., an Episcopal clergyman, professor, and author, died in Baltimore, Md., September 4.
- MARTIN, Robert M., a Maryland jurist, M. C., 1825-'27; Chief-Justice Western Circuit, Md., 1845-'51; Judge Superior Court, Baltimore, 1856-'67; Professor of Law, University of Maryland, 1867-'70; died at Saratoga Springs, N. Y., July 20, aged 72.
- MATTHEWS, Rev. James M., D. D., a clergyman of the Reformed (Dutch) Church, Professor in and Chancellor of the University of the city of New York, from 1831 to 1839, died in New York, Jan. 28, aged 55.
- MEADE, Commodore Richard W., U. S. N., a distinguished naval officer, born in Madrid, Spain, in 1810; a brother of Maj.-Gen. Meade; 44 years in the navy; died in New-York City, April 16, aged 60.
- MÉRIMÉE, Prosper, a French Academician, cabinet officer in 1830, antiquarian, novelist, and dramatist, died in France, October 8, aged 67.
- MILLER, Lieut.-Col. and Brevet Brig.-Gen. Morris S., U. S. A., an army officer, graduated at West Point, 1834, in active service in Florida and Mexican Wars, quartermaster at Washington during late war, died in New Orleans, March 11, aged 56.
- MONTALEMBERT, Charles Forbes de Tyson, Count de, a French publicist, political leader, and author, born in London, May, 1810, an ultramontanist in religion, but a republican in politics, died in Paris, May 12, aged 60.
- MONTGOMERY, William, an active politician of Pennsylvania, M. C., 1856-'60, died near Washington, Pa., April 28, aged 51.
- MOORE, George Henry, M. P., an Irish patriot and orator, born in County Mayo in 1811, educated at Cambridge, M. P., 1847-'57 and 1868-'70, died in London, April 20, aged 59.
- MOWER, Joseph A., Brevet Maj.-Gen. and Col. Thirty-ninth Infantry, U. S. A., commander Department of Louisiana since January, 1869, entered the army as a private in 1846, promoted to a captaincy, 1861, commanded Twentieth Army Corps in 1865, died at New Orleans, January 6, aged 45.
- NADAL, Rev. Bernard H., D. D., LL. D., a Methodist clergyman, author, and professor in Drew Theological Seminary, died in Madison, N. J., June 20, aged 54.
- NIEPCE DE ST-VICTOR, Claude Marie François, a French soldier and chemist, nephew of Nicéphore Niepce, the associate of Daguerre, and himself the discoverer of important processes in photography, a member of the French Academy, died in Paris in April, aged 65.
- NORTON, Daniel S., a Western politician, a native of Ohio, member of Minnesota Senate, 1857-'65; U. S. Senator from Minnesota; died in Washington, D. C., May 14, aged 41.
- OLINDA, Pedro de Aranja, an eminent Brazilian statesman, late premier, died in Rio Janeiro, June 7, aged 80.
- OLMSTEAD, Rev. James Munson, D. D., a Presbyterian clergyman, geologist, and author, died in Philadelphia, October 16, aged 76.
- PABST, Hermann, Ph. D., a German historical writer, an adjutant in the Franco-German War, killed at Mars-la-Tour, France, August 16.
- PACKER, William F., a political leader of Pennsylvania, Governor of Pennsylvania, 1857-'60, and forty years connected with public affairs, died at Williamsport, Pa., September 27, aged 63.
- PAUL, José Jesus, a Venezuelan cabinet officer, political leader, and minister to the U. S., died at Washington, D. C., March 7, aged 45.
- PENNINGTON, Rev. J. W. C., D. D., a colored Presbyterian clergyman, born a slave, self-educated, received D. D. from Heidelberg University, Germany, died at Jacksonville, Fla., October 22, aged 70.
- PILAT, Ignatz A., a native of Austria, a landscape-gardener and architect, chief landscape-gardener to the Central Park for some years past, died in New-York City, September 16, aged 52.
- PLACIDE, Henry, a distinguished actor, born in South Carolina in 1799, appeared on the stage first in 1803, admirable in dignified parts, died in Babylon, L. I., January 23, aged 70.
- POLLOCK, Rt. Hon. Sir Frederick, Bart., an English jurist, king's coun-

- sel, 1827; M. P., 1831-'44; Attorney-General, 1834-'37 and 1841-'44; Chief Baron of the Court of Exchequer, 1844-'66; baronet, 1866; died in London, August 23, aged 87.
- POPE, Charles A., M. D., an eminent surgeon and professor of surgery in St. Louis, died in Paris, Mo., July 6, aged 52.
- PRENTICE, George Denison, a journalist and poet, born in Connecticut, December, 1802, graduated from Brown University, 1823, editor *Connecticut Mirror*, 1825; *New-England Weekly Review*, 1828-'30; *Louisville Journal*, 1830-'69; author of several volumes of humor; died in Louisville, Ky., January 22, aged 67.
- PRESSLY, Rev. John T., D. D., a clergyman of the United Presbyterian Church, and Professor Systematic Theology in Alleghany U. P. Theological Seminary, died in Alleghany, Pa., August 13, aged 67.
- PRÉVOST-PARADOL, Lucien Anatole, a French republican, academician, author, and editor, French minister to the United States, died by suicide at Washington, D. C., July 20, aged 41.
- PRICE, James B., an English landscape-painter and Vice-President for many years of the Society of British Artists, died near London, July 24, aged 70.
- PRICE, Thomas L., M. C. from Missouri, 1861-'63, member Chicago Convention, 1864, and of Philadelphia National Convention of 1866, died in Lexington, Mo., July 15.
- PRIM, Don Juan, Count de Reus, Marquis de los Castillejos, Marshal Duke de Tetuan, Captain-General of the Spanish Armies, and Regent of Spain, born at Reus, in the province of Catalonia, Spain, assassinated in Madrid, December 28, aged 66.
- PROUDFIT, Rev. John, D. D., a Presbyterian clergyman of New-York City, professor in Rutgers' College, New Brunswick, N. J., for twenty years, died in New York City, March 9, aged 70.
- PYNE, James B., an English landscape-painter and Vice-President for many years of the Society of British Artists, died near London, July 24, aged 70.
- RADFORD, William, a political leader, M. C. from Westchester County, N. Y., 1863-'65 and 1867-'69, died at Youkers, N. Y., January 18, aged 57.
- RATAZZI, Madame Marie Studolmine de Solms, *née* Bonaparte-Wyse, a brilliant woman, granddaughter of Lucien Bonaparte, an author of considerable merit, and a journalist, married, in 1863, to Urbano Ratazzi, in 1862 Premier of the Kingdom of Italy, died in Florence, July 27, aged 40.
- RAY, Dr. James H., an able journalist, editor successively of the *Chicago Tribune* and *Post*, died in Chicago, September 24.
- REDDING, Cyrus, an English journalist, compiler, and author, the Nestor of the press, died in London, June 1, aged 85.
- REED, Rev. David, a Unitarian clergyman and journalist, founder and forty years proprietor of the *Christian Register*, died in Boston, June 6, aged 79.
- RIDGEWAY, Robert, a journalist, M. C. in Forty-first Congress from Fifth Virginia District, died in Amherst County, Va., October 17.
- RIPLEY, Brevet Major and Brig.-General James W., U. S. A., graduated at West Point, 1814, Chief of Ordnance Department, died in Hartford, Conn., March 5, aged 76.
- RISLEY, Gen. Elijah, a prominent citizen of Fredonia, N. Y., born in Connecticut in 1787, but sixty-two years a resident of Fredonia, M. C., 1849-'51, died at Fredonia, N. Y., January 9, aged 83.
- RITCHIE, Mrs. Anna Cora Mowatt, *née* Ogden, an American actress and authoress, of high character and ability, died near London, England, July 26, aged 49.
- RITOHK, Robert, Commodore U. S. N., fifty-six years in service, commodore on retired list in 1867, died in Philadelphia, July 6, aged 70.
- ROBINSON, Mrs. Thérèse A. L. von Jacob, widow of the late Professor Edward Robinson, and an authoress of decided ability both in fiction and history, died in Hamburg, Germany, April 13, aged 73.
- ROTHSCHILD, Baron Nathaniel, third son of Baron Nathan Meyer, one of the partners of the Rothschild banking-house, died in Paris, February 19, aged 58.
- RUSSELL, Abraham D., a New-York jurist, of Jewish birth, City Judge of New-York City, 1857-'69, died in N.-Y. City, April 26, aged 53.
- SALM-SALM, Prince Felix von, an Austrian prince, identified with the American War of 1861-'65, on Maximilian's staff in 1865-'66, an author of some note, killed at the battle of Gravelotte, France, August 18, aged 42.
- SALNAVE, Sylvain, a Haytian general, President of Hayti in 1866-'69, born at Cape Haytien in 1827, executed at Port-au-Prince, Hayti, January 15, aged 43.
- SAXONY, Amelia Maria Friedrich Augusta, Duchess of, sister of Wilhelm I., King of Prussia, a dramatic writer of much ability, and a musical composer; her dramas were published under the name of Amelia Heitar; died at Dresden, Saxony, September 18, aged 76.
- SAYRE, David A., a philanthropic banker of Kentucky, who had given over five hundred thousand dollars to benevolent objects, died at Lexington, Ky., in September, aged 77.
- SHAEFFER, Brig.-Gen. J. Wilson, an officer of U. S. V. on the staff during the war, Gov. of Utah, 1870, died at Salt-Lake City, Oct. 31.
- SEYMOUR, Sir George Francis, G. C. B., G. C. H., Admiral of the Fleet, born 1787, wounded 1806, captain 1809, Lord of the Admiralty, Commander-in-chief of Squadron, etc., died in London, January 21, aged 83.
- SIMMS, William Gilmore, LL. D., an American poet and novelist of great merit, died in Charleston, S. C., June 11, aged 64.
- SIMPSON, Sir James Young, M. D., D. C. L., a Scottish physician, professor, author, and discoverer of the anæsthetic properties of chloroform in obstetrics, died in Edinburgh, May 7, aged 59.
- SINGH, Rajah Sir Deo Narain, K. C. S. I., a Hindoo nobleman, of great scientific culture, integrity, and liberality, died at Benares, India, August 28.
- SOUBLETTE, Carlos, a Venezuelan statesman and diplomatist, Secretary of War, State, Foreign Affairs, and Finance, President of Venezuela, 1842-'46, ambassador subsequently to England, France, and Spain, died at Caracas, Venezuela, February 12.
- SOULÉ, Pierre, a Louisiana jurist, diplomatist, etc., a native of France, United States Senator, 1847-'53; minister to Spain, 1853-'55; commissioner of the Southern Confederacy, 1861-'62; exile, 1862-'68, died in New Orleans, March 26, aged 69.
- STARBUCK, Calvin W., an enterprising newspaper publisher, founder and proprietor of the *Cincinnati Times*, 1841-'70, died in Cincinnati, November 15.
- STODDART, John T., a prominent citizen of Maryland, M. C., 1833-'35, died in Charles County, Md., July 19, aged 80.
- STOEVEK, Martin Luther, Ph. D., LL. D., a professor in Gettysburg College, Pa., editor, author, and philanthropist, died in Philadelphia, July 22, aged 50.
- STONE, Rev. Collins, an eminent scholar and writer, connected with the American Asylum for Deaf and Dumb, as teacher, from 1833 to 1852; Principal of Ohio Institution for Deaf and Dumb, 1852-'63; Principal American Asylum for Deaf and Dumb, Hartford, 1863-'70; killed by railroad collision at Hartford, December 23, aged 58.
- STRUBE, Gustav, a German revolutionist and author, died in London in August, aged 65.
- SYME, James M., R. C. S., Edinburgh, a Scottish surgeon, author, and for thirty-nine years professor of surgery in London and Edinburgh, died in Edinburgh, June 26, aged 70.
- TENTERDEN, John Henry Abbott, second Baron, an English Conservative peer, son of Chief-Justice Tenterden, died in London, April 13, aged 74.
- THOMAS, Maj.-Gen. George H., U. S. A., a native of Virginia, one of the ablest of the Union generals of the war of 1861-'65, hero of Chickamauga and Nashville, died in San Francisco, March 28, aged 54.
- THOMSON, Rt. Rev. Edward, M. D., D. D., LL. D., Bishop Methodist Episcopal Church, 1864-'70, preacher, professor, college-president, editor, and author, died at Wheeling, W. Va., aged 60.
- THORPE, Benjamin, an English philologist and author, died in London, July 23, aged 62.
- TRIMBLE, Allen, a prominent citizen of Ohio, Governor of the State in 1822, and from 1826 to 1830, died in Hillsboro, Ohio, Feb. 3, aged 87.
- UJHÁZY, Ladislás, a Hungarian patriot and exile, Governor of Comorn in 1848, resident in United States since 1849, died in San Antonio, Texas, March 7, aged 79.
- URQUIZA, José Justus Manuel de, Dictator of Argentine Confederation, 1852-'54, and President, 1854-'64, assassinated at Entre Rios, Argentine Confederation, in May, aged 70.
- VANGEROOD, Karl Adolphe von, J. U. D., a German publicist and author, Professor of Roman Law in the University of Heidelberg, died in Heidelberg, October 11, aged 62.
- VERPLANCK, Gulian Crommelin, LL. D., an American scholar, author, politician, etc., M. C., 1825-'33, died in New-York City, March 18, aged 84.
- VILLEMANN, Abel François, a French author, historian, professor, academician, and statesman, died in Paris, May 10, aged 80.
- VON GRAEFE, Albrecht, M. D., Ph. D., a German physician, professor, oculist, and philanthropist, died in Berlin, July 21, aged 42.
- WAKEFIELD, Mrs. Nancy W. P., better known by her maiden-name of Nancy W. Priest, an American poetess, author of "Over the River," etc., died at Winchendon, Mass., in September, aged 33.
- WALBRIDGE, Hiram, an eminent merchant and politician, M. C., 1853-'55, died in New-York City, December 6, aged 49.
- WALDECK, Franz Leo, a Prussian Liberal statesman and jurist, died in Berlin, May 12, aged 68.
- WASHBURN, Peter Thacher, a political leader in Vermont, Adj.-Gen. of the State, 1861-'65; Governor, 1869-'70; died at Woodstock, Vt., February 7, aged 55.
- WELCH, Rev. Bartholomew T., D. D., an eloquent Baptist clergyman and author, long settled in Albany, died at Newtonville, Albany County, N. Y., December 8, aged 76.
- WESTERMANN, Antoine, Ph. D., a distinguished German philologist and classical professor in the University of Leipzig, died at Leipzig, January 16, aged 64.
- WHISTLER, George W., an American engineer, born in Connecticut, educated as a railway engineer under his father, and subsequently, in connection with the great locomotive-builders of Baltimore, Ross Winans & Sons, built the Russian railways, died at Brighton, England, January 24, aged 50.
- WILLARD, Mrs. Emma, the most celebrated of American female teachers, and author of numerous historical and other works, died at Troy, N. Y., April 15, aged 83.
- WILLIAMS, Edward P., Commander U. S. N., twenty-two years in the service, lost on the Oneida near Yokohama, Japan, June 23.
- WILLIAMS, Rev. Rowland, D. D., an English clergyman and author, formerly Vice-principal and Professor of Hebrew in St. David's College, Lampeter, Vicar of Broadchalke, and one of the "Essayists and Reviewers," died at Broadchalke, Wilts, January 18, aged 53.
- WILLIAMS, Sherwood, M. C. from Fourth District, Kentucky, from 1835 to 1841, died at San José, Cal., March 29, aged 66.
- WILLIS, Nathaniel, journalist, and founder and editor of several religious newspapers; father of the late N. P. Willis, died in Boston, May 26, aged 90.
- WOODFORD, Field-Marshal Sir Alexander George, Bart., G. C. B., a veteran army officer, Governor successively of Malta and Gibraltar, and, since 1856, of Chelsea Hospital, died there, Aug. 26, aged 88.
- WRIGHT, Henry C., a noted lecturer on antislavery, peace, etc., died at Pawtucket, R. I., August 16.
- WRIGHT, Rev. Luther, an eminent scholar, Principal of Williston Seminary, East Hampton, Mass., for forty-eight years, died at East Hampton, Mass., in October, aged 73.
- WYNDHAM, Sir Charles Ashe, K. C. B., a British lieutenant-general, distinguished in the Crimean and Indian Wars, died at Jacksonville, Fla., February 2, aged 60.
- YEADON, Richard, a Southern journalist, long the able editor of the *Charleston Courier*, died at Charleston, April 25, aged 68.

TABLE-TALK.

THE recent refusal of a clergyman in this city to permit the funeral of an actor to take place in his church has revived, in some quarters, a discussion of the moral influence of the theatre. The arguments advanced are not new; but the truth now, as at all times, is neither on one side nor the other of the question, but embraces a large share of all that is advanced both in favor of the theatre and against it. The theatre, like almost all social institutions, is complex; it is a varied and mixed thread of good and evil, and only careful analysis can determine whether its influence upon society has been, as a whole, favorable or not. The same difficulty exists as to many other things. There are people who condemn fiction, and can advance good reasons for their opposition to it. There are others, but not so many, who question the advantage of poetry, or any of the forms of refined or imaginative literature. Art, in many of its forms, does not escape the severe analysis of the moralist, nor does music, excepting for religious purposes, meet the approbation of purists. It is possible for a powerful and to some minds a convincing train of arguments to be advanced against all those things which serve to warm the imagination, excite the emotions, and relax the mind. A people wholly devoted to such refined pleasures as art, poetry, and music, would soon lose all its robustness of character, and become degenerate, effeminate, and contemptible. But, on the other hand, a people wholly insensible to pleasures of the imagination would be dull and brutal. It is sometimes the pleasure of a poet to imagine an Arcadian people in whom innocence, gentleness, and ignorance, are united—people with pure thoughts, simple hearts, and kindly natures, who remain in ignorance of the sin and ambitions of life. But Arcadian peoples exist only in poetry. Without those refinements that come of civilization, men are never innocent, gentle, and pure. Whatever injury art, poetry, music, and other products of the imagination, may cause when attaining too large a place in our civilization, these things are absolutely necessary if a people are to be other than rude and stupid. These are truisms, perhaps; but it is necessary to state them, in order to show in what spirit and with what understanding the influence of the drama is to be discussed. That certain evils are to be traced to the theatre is no argument against it. So certain evils be traced in every one of our institutions. Many a mind has become effeminate, weak, and worthless, under novel-reading; but so has many a mind been sweetened and humanized by it. Poetry will greatly elevate the imagination; but a surrender of the whole nature to the sweet and dulcet strains of the verse-maker would soon render one luxurious and effeminate. Fine paintings give a glow and delight to the mind; but he who is greatly enamoured of colors and ideas in color is apt to become sensuous and weak. Let the drama take its equal place among the arts. Let its excesses be watched and confronted, just as all other excesses are; but these excesses should blind no one to its mis-

sion. It has, in its time, been illuminated by great lights. It has shed lustre over many periods in history. It has been, in certain epochs, almost the sole instructor of the people. It has, just like all other arts, struggled through its sloughs of despond, fallen sometimes into wrong paths, and been used for bad ends. But it was one of the earliest aids by which men advanced from barbarism to civilization, and, without it and its kindred arts, culture and taste would be unknown. As to the conduct of the divine to which we refer in the opening sentence, it is scarcely worth while, at this late hour, to add our voice to the general indignation. The censure which it has received seems entirely deserved. It is marvellous, indeed, that any one should be moved to deny to the remains of a man, who all unite in declaring had led a blameless life, those last rites which are even extended to malefactors. By this unwise act, a good man's memory was outraged, a large body of worthy people were insulted, many hearts, no doubt, hardened against religion, and the fair name of Christianity was defamed.

— A sentiment more or less prevails that a man holds at his individual pleasure the life of one who has seduced his wife or sister. That the just indignation of an injured brother or husband should palliate killing when committed in sudden rage, or under circumstances well calculated to arouse the fury of the wronged one, we will not at present dispute. That provocation for killing, however, should be very great indeed if the crime is to be excused, we believe to be not only a cardinal principle, but one essentially necessary for the security of society. But killing under any provocation for any cause, when committed coolly, deliberately, and with clear intent, we believe to be murder, and we are convinced that it is important the public should so consider it. It is simply absurd to say that murder ceases to be a crime because there is temptation to commit it. Under this logic, pretty nearly every offence against the laws would have to be condoned—even, perhaps, the very offence for which killing is assumed to be the only just retribution. It is our business to control our passions and resist temptation. The whole interest of civilization is to this end. If we are to obey laws only when we don't want to break them, and to exhibit the graces of civilization exclusively when the impulses of our nature require no suppression, law and civilization both are but idle mockeries. But there is another logic in these seduction-murder cases which we find most excellently expressed in a recent number of the *New-York World*. A Mr. Gunn, of San Francisco, learned from an anonymous letter that his sister, fifteen years before, had unwisely yielded to the seductions of one Mr. Murphy. Mr. Gunn's sister, being confronted with this charge, admitted its truth. Whereupon Mr. Gunn, "with that thoughtful tenderness for his sister's welfare, which is so beautiful in brothers," proceeded immediately to kill the seducer, and then to make public the long-past crime. This senseless, most illogical murder, we are told, is justified by public opinion in San Francisco. We hope not. "Of course," says the *World*, "if a man considers

that his sister's shame is a legitimate subject of public curiosity, and having, after fifteen years of what appears to have been correct conduct on her part, heard from some scoundrel of her early error, scorns to confine the knowledge to his own breast and compels the attention of his fellows to it, nobody can say him nay. But when he kills another upon the pretext thus furnished him, it is evident that the wrong is not in any way mitigated, but in every way intensified. The sister who might have led the rest of her life blamelessly is held up by what purports to be brotherly love to public scorn. The man who had done her the injury which her 'avenger' alone made an irreparable injury, is dead. Gunn himself, whether or not he is acquitted, has rendered himself a social outlaw. And the only person who has gained any thing by the transaction is the wretch who wrote the letter which brought on the tragedy. He has fed fat the grudge which he certainly bore to Murphy, and which it is very probable he bore to Gunn's sister, and Gunn has become his cat's-paw and taken the vengeance the other was too cowardly to take for himself. As for Gunn's motive, it is clear from the whole story that his sister's good name and his own—every thing that was at stake for him, and might have been saved—has been lost by this slaughter. He acted neither from reflection, nor from love, nor from an intelligible pride, but simply from the reckless fury which makes all murderers what they are, and which it is the care of government and society to bridle. It is only by learning to bridle it that a man deserves to be called a civilized being, and for letting it loose he deserves to be called a savage."

— The editor of *Old and New* addresses to his contributors five questions, all of which are so excellent, that we make haste to transcribe them here, in order that the legion of writers for the JOURNAL may study, digest, and apply. Here they are, with a comment or two of our own:

"1. Could you not live, and yet not roll up your manuscripts?" (We mean, some of these days, to organize an association of editors pledged never to read a manuscript that comes in a roll. If you would save the editor, ladies and gentlemen, no little vexation, let your sheets be flat—but don't apply this advice to your style.)

"2. Could you be so kind as to write your proper names legibly?" (and write your address on the manuscript; and when you have occasion to write to the editor, to recollect that he possibly has more than one article under consideration, so that it would greatly aid him if you would kindly mention what you are talking about? Every day come letters, saying "I sent you a manuscript, etc.," or, "When are you going to print my article?" without any mention of the title of the work inquired about, which it would seem to be easy enough to give.)

"3. Would you leave off the introduction and omit the conclusion?" (That is, begin at once, without circumlocution, and end when you have finished.)

"4. Would you write on note-paper, not folded?" (or on any small sheet, with the pages of uniform size?)

"5. Would you send the manuscript to us, instead of sending it to a friend of a clergyman, who knows a doctor, one of whose patients was in college, etc., etc.?" (Send by post, with stamps for return, and don't expect the editor to enter into explanations why he does not accept your article, or to point out its errors and defects, and show you how you can make it acceptable. An editor is not a school-master, and it is not his province to educate his contributors. He purchases whatever may seem to him suitable, provided he has space to print it, and he would have no time for his ordinary duties if he were to act as literary mentor to every one who might demand his critical aid.)

But while all this advice is good for contributors, there is something also to urge upon subscribers. If our friends only knew the difficulties and vexations that arise in a publishing-office, because people will forget to give their post-office address, and insist upon signing their names illegibly, there would be a reform in these matters at once. Will our friends bear in mind that almost every town has several duplicates of its name, and that, unless the *State* is given, we are utterly at a loss to know where to send an answer to a letter, or to direct a subscriber's paper? And if the name is not given distinctly, letters and papers are quite likely not to reach the right persons. We shall not grumble at the number of subscriptions that may reach us; but subscribers for their own sakes, if not for ours, should be definite and clear, in giving name and address.

— "Mrs. Burlingame," say the papers, "hopes that women will pound at university-doors until every educational institution in the land is opened to both sexes." The most important educational institutions, we imagine, are books, and these are open always to both sexes. Just at a time when men are seriously questioning the supreme advantage of university-training, and in almost every branch of effort we see some of the greatest triumphs attained by men self-taught, it is odd to see women clamoring for college-courses. Faraday did not attain his eminence in science, nor Dickens his fame in literature, by besieging university-doors. Tyndall, when a young man, did not go about lamenting a fate that excluded him from universities, but rose with the sun, or before it, every morning, and resolutely gave a large part of every day to severe study. If women would establish the intellectual equality of the sexes, let them show they can do without colleges, just as many of the best masculine intellects have done.

— The old saying that "happy is the nation that has no history" we see quoted in reference to our exemption, during the past year, from wars, turmoils, or other matters of the kind, supposed specially to supply material for historians. But this is an idea of history that is now passing away. Instead of merely recording the intrigues of courts, the succession of sovereigns, the movements of armies, we find it asserted that it should rather be employed in tracing the growth of nations, the advance of arts and sciences, the spread of commerce, and the development of

industry. Under this interpretation of history, we may say, "Happy is the nation whose history is the fullest."

— The list of the "Famous Dead of 1870," which we publish in this number of the *JOURNAL*, is a long and melancholy one. Few years, indeed, have added to the always-swelling records of mortality so many loved and brilliant names. Think of uniting in one record of death sailors so great as Farragut and Dahlgren; authors so loved as Dickens, Simms, and Kennedy; soldiers so famous as Thomas and Lee; divines so esteemed as Barnes and McClintock! There are names, no doubt, that might with propriety have been added to our list; but we could scarcely give a record of all who, dying, have left honorable names and a measure of fame, without encroaching too greatly upon our pages.

Foreign Literary Notes.

OUR Paris correspondent has sent us some brief reviews, which we subjoin, of recent publications in France. It would seem that the interests of literature in that now sorely-tryed country have not entirely succumbed to the pressure of war:

"History of the Church of Paris," by M. l'Abbé Bernard. The first volume of the Abbé Bernard's important work upon the origin of Christianity in France has just been published. This book, the fruit of earnest study and solid erudition, is written in a wise and liberal spirit. Unlike many Catholic authors, he gives no credit to the absurdly miraculous legends that passed current in former times, but are now only repeated by credulous peasants. On the contrary, he frequently takes the trouble of divesting them of their figurative, and clothing them in their real meaning. His analysis of the legend of Saint-Denis, the progression of which he exhibits step by step, gives us a characteristic proof of his love of logic. He proves that pious monks, referring to the sufferings of the martyr, originally said that the head of Saint-Denis was still eloquent even in the stiffness of death; meaning thereby that the good words, deeds, and writings of the saint were more effectual after his death than during his lifetime. Their successors, taking the literal meaning of the sentence, related that the martyr preached after his death. They did not, however, rest content with this assertion; the body of the martyr was burned with his head in his arms; and in the tenth century the complete legend did not fear to assert that Saint-Denis, holding his head in his hands, still walked upon the earth, preaching the gospel with his accustomed eloquence. Praise is due to the abbé for his endeavors to disengage religious history from the dross of credulity. The use of reserved criticism is not the only merit of this book, which is besides recommendable both for its erudition and elegance of style.

"History of German Literature," by M. Heinrich. A comprehensive and highly interesting history of German literature, in three volumes, has recently been published by M. Heinrich. The task of following out the history of German genius in its literary manifestations is, to say the least, difficult and arduous. During the whole of the middle ages this genius is represented by a vast efflorescence, which blossoms everywhere throughout Germany, yielding fruit, however, only at irregular intervals; while during the eighteenth

and nineteenth centuries it has produced works of infinite variety and range, the merits and influences of which cannot easily be estimated. This task has been courageously undertaken by M. Heinrich, for which he in all respects is well qualified. In the first volume he has described and criticised the chief productions of the early and middle ages. The great *epique* of the "Niebelungen," and the poetry of the "Meistersänger" find in him an exact and sympathetic historian, thoroughly acquainted with the most recent scientific investigations. The second volume is consecrated to Lessing, Schiller, and Goethe, while the third reviews the literary productions of the present generation. This work is the most complete and comprehensive history of German literature yet published in France, its chief merit being profound erudition, methodical arrangement, lucidity, and calm impartiality.

"Rome of the Augustan Age," by M. Ch. Dezobry. The best recommendation of this important work is that it has already gone through three editions. The high estimation in which the reflecting public holds profound erudition and the love of unwearied research, of which this book is the result, has fully confirmed its success. Following in the steps of the author, the reader obtains a bird's-eye view of the capital of the Roman Empire, the city *par excellence* at the time of the establishment of the "principat" before the republic had yet disappeared. Political institutions, civil and religious life, commerce, literature, morals, manners, spectacles, games, etc., appear in succession to the eye of the student, thanks to the advantages of a descriptive recital, traced by the pen of a traveller. The new edition just published contains numerous improvements in the composition, and important corrections, rendered necessary by recent archaeological discoveries, which cannot fail to heighten the recognized merits of the work. The illustrated part is also rearranged, the number of plans and engravings being considerably increased. We may mention that this work is the fruit of fifteen years' study, the author having taken no less than thirty-five years to bring it to its present elaborate form.

"Les Châtiments," by Victor Hugo (new edition). Two Bonapartes have filled the throne of France after a *coup d'état*, and, after maintaining their position by force or fraud, have fallen victims to their own folly. By a singular coincidence, both have had their eminent poet to accuse and stigmatize them. The first, who was great in spite of his faults and crimes, was judged by the lofty genius of Chateaubriand, whose voice alone rose to condemn, in the boldest accents, the ambush of Ettenheim and the midnight murder of the poor Prince d'Enghien in the *fosse* of Vincennes; but the second, whose adventurous career, full of ambiguity, has been crowned by an end so miserable, was held up to scorn and ridicule by the energetic genius of Victor Hugo, with his inexorable passion and violent invectives. The whole civilized world knows with what wild fury he registered his protest against the *coup d'état* of the 2d of December, but few ever thought that the punishment, meted out to Napoleon III., would one day exceed the poet's hopes of vengeance and retribution. "Les Châtiments," or "Punishment," is a collection of poems full of the bitterest satire against the imperial dictator, which has now for the first time been published in Paris, the former edition, printed in Brussels and London, having been strictly prohibited in France. The Parisians can now for the first time admire

those magnificent masterpieces of satire, those poems which, in spite of offensive personalities, are still so rich in thought and exquisite in form, with the conviction that the poet's victory and vengeance are complete, but also with the sad reflection that their unhappy country has fallen prostrate along with the object of his enmity.

The papers and correspondence of the imperial family (thirteen numbers of which have been published) contain many curious and unexpected revelations. The Emperor Napoleon III., to do him justice, had the greatness and prosperity of his country sincerely at heart. Projects, in his own handwriting, for the development of trade and industry, the education of the masses, the suppression of crime, the extinction of misery, and the relief of the industrious poor, were found in his private bureau, several of which have been successfully adopted. Whatever may have been his shortcomings, no one can deny that in his theories there was much nobility of sentiment allied to generosity of purpose. But, in the view we get of the daily life of the emperor, as revealed in the correspondence, we obtain frequent glimpses of much that was, to say the least, reprehensible—such as his interference with the rights and liberties of his subjects, his system of espionage, his secret bureau for the interception and examination of suspected letters, his connivance with the chief magistrates of the nation to foment mock conspiracies, the better to attain certain political ends, the tricks and manoeuvres organized by him to obtain his sweeping majorities, the fears he contrived to excite in the simple-minded peasants by displaying to them the terrors reserved for them by the Red Republicans, and, what was more serious, his perpetual intriguing and intermeddling with the affairs of neighboring states.

M. A. Joanne has likewise published a small work upon the "Environs of Paris," containing a number of maps and plans on a large scale, showing the most minute details, and giving in a small compass much valuable information for following the different phases of the siege of Paris, such as the exact distance between the various points, the description of the highways, railroads, strategic points, historical monuments, ancient chateaux, churches, etc., and the aspect and resources of the country. The Parisians confined within their walls peruse M. Joanne's new work with mingled feelings of pleasure and regret: of pleasure, when they revive associations of happier times, and of regret when they regard the misery and ruin reigning over the scenery they loved so well to visit. Instead of the pleasant villages and happy homes of four months ago, they now see on every side the traces of this war of extermination in smoking ruins, desolate hearths, and devastated fields; a melancholy sequel to the list of unparalleled disasters that have befallen France.

"The Family Debt," by M. A. Labutte. It is needless to say that M. A. Labutte's new novel, "The Family Debt," was written before the sad realities of a disastrous war had turned aside all classes in France from the quiet emotions of works of fiction. The plot of the work is complicated and would take too long to explain, on account of the exaggerated number of personages figuring in the drama. The victim and principal heroine is a pitiless mother, who, to preserve her reputation of virtue, which at one time failed, without even the ordinary excuse of affection, seeks to sac-

rifice to this usurped reputation her natural daughter, a charming young lady, in all respects worthy of the happiness to which she eventually attains. M. Labutte's novel possesses genuine merit, shows considerable power and freedom of conception, and is written in a correct and easy style, enlivened with frequent sallies of wit and humor.

"Dictionary of Pure and Applied Chemistry," by M. Würz. M. Würz has commenced the publication of his Dictionary of Chemistry, the first volume of which has just been issued. This great work is rather a vocabulary containing the words and definitions of divers bodies, being a collection of monographies, more or less extensive, treating upon the great diversity of matters embraced under the term of chemistry. Inquiring minds, desirous of studying the close relations existing between the sciences, will find in this dictionary wide fields of observation; the explanation of physical phenomena and the principles of anatomy and physiology being given with great concision and lucidity. To terminate his great undertaking in the briefest delay possible, Dr. Würz has secured the coöperation of a number of eminent chemists, each of whom, according to his special aptitude, treats upon the subjects most familiar to him, which his arduous labors in the laboratory have best enabled him to investigate.

M. A. Joanne has published an interesting "Atlas of the French National Defence," comprising a series of maps of the seventeen departments invaded or threatened by the German armies. To study the *ensemble* of the military operations, this "Atlas" is certainly the best and most convenient of any available to the public.

War Notes.

Siege of Paris.

FROM our Paris correspondent we receive, by balloon-post, particulars of the siege of Paris to December 9, 1870:

"The immense masses of Germans, concentrated during the night behind Coeuilly and Villiers, were precipitated upon the positions occupied by the army of General Ducrot on the morning of the 2d of December, before day-break. This sudden and unexpected attack along the whole line threw back the French advanced posts in disorder upon the three army-corps stationed between Champigny and Bry-sur-Marne. The formidable batteries established by General Trochu upon the heights of Avron, combined with the fire of the long-range guns of the forts of Nogent, Faisanderie, Gravelle, St.-Maur, and Charenton, opened a terrific fire upon the assailants, which crushed and shattered the heads of their columns, completely arresting their progress. After vainly attempting to break into the French lines during three hours, they at last gave way, and slowly retired to the shelter of the woods behind Coeuilly and Villiers. The French, advancing under the protection of their artillery, attacked them with great resolution, but made no visible impression upon their orderly retreat. Every inch of the ground was so well contested that no less than five hours elapsed from the time the Germans began to give way until they disappeared behind the woods of Villiers. In this long and terrible struggle the young French troops showed the greatest intrepidity, advancing or remaining passive under the storm of projectiles.

"The French loss in killed and wounded in this battle amounted to six thousand. The Germans, everywhere exposed to the fire of the French batteries of long-range guns, which told with fatal effect even among their most remote reserves, had more than twelve thousand men *hors de combat*, several of their regiments having been annihilated, according to the statement of the officers taken prisoners. The total number of prisoners made on the battlefield exceeds one thousand. On the 2d and 3d the steamboats of the Seine were again engaged, day and night, in transporting the wounded from the banks of the Marne to the Jardin des Plantes, where they were placed in vans and distributed throughout the ambulances of the city.

"Many a heart-rending scene was witnessed here, as parents and wives received their mutilated sons and husbands, or heard of their cruel death on the battle-field. No wonder that the voice of lamentation is heard so often, when so many hearts are broken, so many hopes crushed, and so many happy homes made desolate! Shall they, whose guilty ambition and lust of conquest produce so much human suffering and misery, have no account to render of the blood shed? A generous-hearted youth, shot through the side, more grieved about the sorrow his presence would cause at home than concerned about the gravity of his wound, murmured, on being lifted over the gangway: '*Ma pauvre mère!*' ('My poor mother!') Surely, the complaint of so many innocent victims will rise in judgment against the authors of their sufferings.

"On the 3d December, under cover of a dense fog, the Second Army of Paris, under General Ducrot, recrossed the Marne, retired to the wood of Vincennes to recruit their exhausted energies, reform their regiments, and prepare for a vigorous sortie in some other direction. The Germans will thus again be obliged to concentrate their forces upon the point threatened, which will again be exposed to the crushing fire of the French heavy artillery.

"Those attacks, incessantly renewed, will keep the Germans perpetually on the alert, and gradually weary them out, when, combined with the movements of the armies of the provinces, they will perhaps yet break through the lines of investment, defeat the Germans, drive them from their intrenchments, and pursue them to the frontiers. On the day when such a disaster overtakes the German hosts, the strength of the old King of Prussia will depart from him, and the wisdom of Bismarck be turned to foolishness.

"The system of violence, rapine, and assassination, inaugurated by the military chiefs of Germany in the invasion of France, is in the highest degree dishonorable to them. They ransom—that is to say, ruin—by forced contributions, the towns, and bombard them in the event of their non-compliance or resistance; they strip the peasants of their horses, cattle, and grain, leaving them helplessly ruined; they force them to work in their lines of intrenchment, exposed to the projectiles of their countrymen, but shoot them down mercilessly if they dare to defend themselves. No wonder, then, that such a bitter feeling of hatred has sprung up in the hearts of all Frenchmen against their cruel invaders. This hatred will certainly outlive the present generation, and the Germans, from the seed they now sow, may yet reap a harvest of ruin and disasters. The new phase the defence has assumed admits of no surrender; war to the knife, to the last extremity, is the desire universally expressed. The exclamation of a national guard, the other day, crossing the Pont-Neuf, explains

the situation of Paris: "We have bread and wine for three months to come, and courage for a thousand years!"

Germany after the War.

The *Full Mall Gazette* utters the following apprehensions as to the effect of the war on the morals of Prussia: "The Prussian army, we know, is not really the nation in arms. That is merely the theory, and the actual practice consists in a complex system of expedients by which the theory is evaded. But the forces now overrunning France do really include the large majority of the men by whom the moral and civil life of Germany is to be carried on for a whole generation. How materially the German army differs from that of other nations is best gathered from the impressive story which has just gone the round of the newspapers. A regiment two thousand strong reckoned up the number of its children, and found them to be seven thousand. No doubt it was a regiment of the reserve; but the regiments of the line in the Prussian army consist substantially of men destined to be fathers of families in a year or two after the close of the war. What sort of morality are these soldiers learning? What sort of morality are they preparing to teach their children? It is not probable that a man's moral nature is much altered by taking part in the operations of war which are conducted according to the strict rules of the art. But that stage of the present war has long since been past. The German soldiers are now habitually (and doubtless, under the circumstances of the war, unavoidably) employed in practices distinguishable only by the finest and faintest line from the robbery, arson, and murder, for which men in civil life are hanged every day. It is allowed that they are shooting every peasant whom they find by the road-side with a pistol hidden in his pocket. It is admitted that they are laying whole cities under contribution for millions, and leaving the open country behind them as bare as an Eastern plain after the passage of a flight of locusts. It is acknowledged that they have burned village after village to ashes. It is not necessary to believe with some that they are conducting the war with unprecedented savageness; we might even accept the assertion of others that the leniency of the victorious armies is unexampled. But similar atrocities have only for many centuries been committed by professional soldiers. The Prussian army is a civic army, and the question is as to the future state of a nation which has had the flower of its manhood trained to civil life by this bloody apprenticeship." The *Gazette* might have drawn some consolation from the facts of our American war. The armies in the field, both North and South, were civic armies, and these have been absorbed by the community without any essential moral degeneracy resulting.

Noses.

"Give me a man with plenty of nose," Napoleon I. is reported to have said, referring to the capacities of officers for high command; and it is certain that his best generals were, as a rule, remarkably well provided in this particular. The aquiline appearance of the great military authorities of the first empire is conspicuous in any collection of their portraits. Look on those pictures and on these—turn from the portraits of the heroes of the first empire to those of the heroes of the second—and mark the difference between the two classes of physiognomy. You will not find a marshal or a general of any note among the leaders at Wissembourg, Woerth, or Forbach, Sedan, Stras-

bourg, or Metz—nor, we believe, among the defenders of Paris—who has the eagle physiognomy proverbially belonging to the great captains of both ancient and modern times, from Alexander and Caesar down to Napier and Wellington. Napoleon III. is an exception as regards the second empire, but Napoleon I. was an exception the other way as regards the first empire; so the one example will balance the other. It is not unworthy of note, by-the-way, that each emperor believed in a type of men unlike himself, the difference being that Napoleon I. chose his instruments and marked them out, while the third Napoleon accepted his instruments as they arose and was content to give them fair play on their own responsibility. The man of Austerlitz knew all about other men, but had no time to know himself, until, perhaps, his period of leisure at St. Helena. The man of Sedan knew himself from the first, and seems to have been so occupied with himself all his life that he has never been able to gauge the merits of others. The latter failing is an admitted cause of his fall, and receives a curious illustration in the fact that he did not enter into his uncle's ideas of physiognomy.

Dr. Russell says it is now very patent that the designers of the Paris forts committed enormous blunders. They put the forts, with the exception of Valérien and the Double Couronne, too near the city, and placed them on the inner line of heights, instead of occupying the outer ridges. Had the heights over St.-Cloud or Montretout, Meudon, and Clamart, been covered with works like Valérien, the difficulties of a besieging army would have been prodigious, and Paris within its double *enceinte* would have had a long life of it. The same remarks apply to the northwest and north of Paris, where there are points over Argenteuil and at Orge-mont, Villetaneuse, etc., which might have been profitably occupied, for there are men enough in Paris to hold even larger lines, and the space inside would have afforded a vast supply of food.

Marshal Bazaine is thus photographed by a war correspondent: "The marshal is fifty-nine years old, his hair of snowy whiteness, while his mustaches and goatee, à la Henri IV., have yet a dark tinge. He is not tall, but well proportioned, and of strongly-knit frame. His physiognomy is very impressive, its traits rigid; his dark eyes are lighted up by an uncommon brilliancy, and indicate the highest degree of firmness. There is a peculiar expression in these eyes—so much so, that whoever meets their glance will not easily forget it. This sharp, eagle-like glance is, indeed, the most prominent characteristic of the external appearance of the conquered hero of Metz, whose organs of vision, even while he smiles, remain piercing and immovable."

According to a calculation in the *Feld-Soldatenfreund*, the French prisoners of war in Germany, after the capitulation of Strasbourg, and previous to that of Metz, consisted of one marshal, fifty generals, four thousand officers, and one hundred and fifty thousand men, including the wounded French in hospital. If we add to this Bazaine's army and the garrison of Metz, the total number of French prisoners in Germany will be; four marshals, about one hundred and forty generals, ten thousand officers, and three hundred and twenty-three thousand men.

A correspondent at the seat of war writes: "In one of the recent engagements in France a Bavarian battery, in a very hot place, ran out of ammunition; but, instead of withdraw-

ing, Lieutenant Peter Widmann, commanding, shouted: 'Lads, if we retire to fetch ammunition, those Frenchmen will think we are running away. We can't shoot at them, that's true, but we can show them we don't care for them. Stand before the guns, all of you, and sing them the "Wacht am Rhein," in stout German chorus!' No sooner said than done; the men formed up with perfect steadiness, and gave the French the musical counterpart of the 'Marseillaise' in their best style, from beginning to end, under a rattling fire."

The number of houses absolutely destroyed during the siege of Strasbourg was about three hundred, but so many have been so greatly shattered internally as to require rebuilding, that that is an under-estimate. There are no indications visible of active reconstruction; on the contrary, pulling down and clearing away are the order of the day, and at this moment Strasbourg looks more ruined than ever. There appears no intention of commencing the rebuilding of the ruined quarters of the city before next spring. There are so many crazy tenements that an *affiche* has been issued, prohibiting any carriage or omnibus proceeding at a gallop through the injured districts of the city.

The war in France has developed not only balloons, carrier-pigeons, and cat-cookery, but a new development of the insurance principle. An association has been formed, called "The Repairer of the Invasion," being a society for mutual assurance against burning, devastation, robbery, pillage, requisitions of hostile commanders, riots, and the other risks of war, which ordinary policies do not cover. This organization has its headquarters at Rouen, and has agents in all the cantons of France not yet overrun by the Prussians.

German women send all sorts of things through the mails to their husbands, sons, or sweethearts, away soldiering. Letters are permitted up to sixteen ounces weight, so they send cigars, tea, chocolate, shirts, and slippers. A pair of slippers can be sent, one in each. One woman sent a flannel shirt in six pieces, by six posts. The last letter contained the left sleeve, with the needle and thread for sewing the shirt together.

The new Bavarian revolution cannon are said to be superior to the much-vaunted mitrailleuses. They can be charged with three hundred and sixty bullets at a time, all of which can be fired off in a single minute. The German soldiers call these guns "hand-organs."

Asnières, formerly a thriving village, situated on the railroad about midway between Paris and the little watering-place of Enghien, and which at the beginning of the war had a population of six thousand, is now reduced to fourteen inhabitants.

Miscellany.

St. Angelo.

AMONG the massive remains of Imperial Rome, one of the most imposing is the ancient Mausoleum or Mole of Hadrian, now known as the Castle St. Angelo. It stands on the site where once were the gardens of Domitia, overlooking the undulating plains of the Campagna in its rear, and stretching out its long covered corridor to the Vatican. Poised on its summit, and dark against the blue Italian sky, towers the bronze figure of the Archangel Michael, as if he had just alighted with

outspread wings and floating mantle, and paused there in the act of sheathing his sword. Beneath it flows the Tiber, in whose tawny and troubled waters it has cast its wavering reflection for nearly eighteen-centuries. There, standing apart from all other buildings, it lifts its battlemented towers and bastions like a guard or a menace to the closely-built city lying across the river before it, and challenges every passenger who, crossing the ancient Ælian Bridge, passes before it on his way to the great Basilica of St. Peter. The bridge has changed its name as well as the Mausoleum, and is now called the Ponte St. Angelo. The statues of gods and heroes placed there by Hadrian have disappeared, and on their pedestals stand the sculptured saints of Bernini, fantastic in their draperies and grotesque in their attitudes, but picturesque in their general effect. The funeral processions, which in the great days of Rome bore the ashes of her pagan emperors across that bridge to the sounding chambers of the mighty Mausoleum, have vanished, and a motley Christian crowd now passes over these ancient arches, through which the swift river has whirled its turbulent current for so many generations; swift, like the river of time—turbulent, like the history of the place; fleeting, never to return, like the generations that have passed.

What a change has come over men and things since first the stones of this great Mausoleum were laid! Could they speak, how sad, how terrible a history they might reveal of human baseness, tyranny, hypocrisy; of human arrogance and misery; and, let us hope, somewhat too of noble endurance, of heroic patience, of uncorrupted virtue and patriotism! Within those walls what crimes have been committed, what agonies have been endured? Without those walls what tumult of seething battle, what clashing of arms and shrieks of pain and fury, what glaring of wild flames, what raging of wilder passions wrecking themselves in murder, rapine, and horrors without a name! In its secret cells popes have been strangled, starved, and sent to a bloody end; philosophers and thinkers have perished, vainly struggling against bigotry and superstition; patriots have fought and died for liberty. On the foul walls of its dungeons artists and poets have scrawled their names, their verses, and their pictures, longing for the light of day; beauty and youth have perished in the dark, vainly praying for help; innocent men have falsely confessed crimes under the torture of the rack. In its frescoed halls emperors and popes have held their courts, and banqueted and trampled on the rights of man; and the ashes of emperors have filled the vases of its sepulchral chamber. The silent statues which gathered once around its colonnades and looked upon the glory and pageant of ancient Rome, saw also the storm and fury of barbarian battle, and the desolation by the Goths, before they were toppled down upon the heads of an infuriated soldiery. These walls, too, have seen the dreary processions of the plague pass under them. They have shaken with the awful heave of the earthquake and the sudden explosion of powder. They have been the silent witnesses of the history of the Church in its blackest moments and at the zenith of its pride and power; and they still stand, a part of the present as of the past.

Scottish Wit.

Since the time when the accession of James VI. to the English throne attracted so many of his poor countrymen to England—to push their fortunes in England, and sometimes, if not often, at the expense of Englishmen, who would

have been glad of their places—to the day when Lord Bute's administration under George III. made all Scotsmen unpopular for his sake, and when Dr. Samuel Johnson vented, in and out of season, his real or pretended dislike to that people, up to the time of Charles Lamb and the late Rev. Sydney Smith, who followed his silly example, it has been more or less the fashion in England to indulge in little harmless jokes at the expense of the Scottish people. It has been the stage custom, and the literary habit at the same time, to portray them not only as overhard, shrewd, and "cannie" in money matters, but as utterly insensible to "wit." Sydney Smith, who was a wit himself, and possibly imbibed his jocosity from the conversation of Edinburgh society in the days when, as he himself said, he "cultivated literature upon a little oatmeal," is guilty of the well-known assertion that "it takes a surgical operation to drive a joke into a Scotsman's head." We shall not attempt to enter into any discussion on the differences between "wit" and "humor," which are many, or strive to define the divergency between what the English call "wit," the French "esprit," and what the Scotch call "wut;" but assert, in contradiction to the reverend joker, that the "wut" of the Scotch is quite equal to the "wit" of the English and the "esprit" of the French, and that Scottish "humor" is infinitely superior to any humor that was ever evolved out of character to the south of Yorkshire. There is one thing, however, which perhaps Sydney Smith intended when he wrote, perhaps without thinking very deeply, if at all, about what he said: the Scotch, as a rule, do not like and do not understand banter, or what in the current slang of the day is called "chaff." In "chaff" and "banter" there is but little wit, and that of the poorest, and no humor whatever. "Chaff" is simply vulgar impertinence; and the Scotch being a plain, serious, and honest people, though poetical, are slow to understand and unable to appreciate it. But with wit, "esprit," or "wut," and humor, that are deserving of the name, they are abundantly familiar; and their very seriousness enables them to enjoy them the more. The wittiest of men are always the most serious, if not the saddest and most melancholy; and if the shortest possible refutation of Sydney Smith's unfounded assertion were required, it might be found in a simple reference to the works of Robert Burns, Walter Scott, and John Wilson.

A Public Dinner in Fiji.

A public dinner in Fiji is a very great affair, and you must take care how you behave at it. All the guests bear a hand in feeding the oven or stirring the pot. A floor of clean leaves is covered with cocoa-nuts, on which are heaped baked taro and yams "to the amount of several tons." The next tier is formed of *vakaloto*, or puddings in green leaves, well oiled. Surmounting this pedestal are the baked turtles, or two or three hogs baked whole. On one occasion there were fifty tons of yams, fifteen tons of sweet pudding, seventy turtles, five cart-loads of yagona, and two hundred tons of uncooked yams. One of the puddings measured twenty-one feet in circumference. A lord-mayor's feast in Guildhall is mere fooling to this. And the turtle, too! But if you have the honor to be invited to a feast in Fiji, you must be cautious. A chief, having eaten a cocoa-nut without offering a bit to one of his followers, the latter went over to the enemy, and in the next battle singled out his former master. He asked to be spared. "Do you not," was the stern reply, "remember the nut? For that you must die." And then

came the fatal blow. Another chief sat down with his father-in-law; but on passing a dish, a cooked guana, he broke off part of its tail. "A dark scowl covered his relative's face," and at the earliest opportunity he slew his son-in-law, having first told him that he could not put up with broken tail.

Lord Lytton's "King Arthur."

We have always understood that Lord Lytton thinks "King Arthur" to be his greatest and most durable work. The world differs from him, as it differed, on a similar occasion, from Petrarch and from Milton. But we do not wonder that he should think so. In truth, it is brilliant verse. The versification, which exhibits a mastery over the difficulty of rhyme as complete as any English writer has attained, is always harmonious and often grand, though not sufficiently various, and wanting especially in the more tender notes of music; there is pathos, though it is too rhetorical to attain the highest effectiveness; there is humor, of very good quality; great bursts of eloquence; a bright and lively fancy; a philosophy, sufficiently imposing of external aspect, which delivers its *placita* in the tersest and most forcible language; in fact, there is every thing but, as we cannot but think, the divine essence itself, which should make it a great poem. It may be compared, not on account of any likeness of style, for the two are wholly dissimilar, but as regards its relations to poetry of the highest kind, with the romantic verse of Sir Walter Scott. But "Marmion," and even its inferior successors, have a marvellous freshness and life which we do not see here. And they do, what this story, though told with much skill and with a power of language which it would be difficult to overestimate, certainly fails to do—they carry the reader along with them.

The Library at Munich.

The library, called the *Hof- und Staats-Bibliothek*, is one of the most splendid buildings as well as magnificent collection of books in Europe, and next in size to that of Paris, which is acknowledged to be the largest in the world. Some idea of the proportion of the building may be formed by a view of its front, which measures some five hundred and twenty feet, is eighty feet in height to the roof, and has seventy-two windows. This beautiful building is built in the Byzantine-Florentine style, it taking some twelve years to complete it. If this is the front, the stranger is more pleased in walking up the grand staircase and observing its beautiful marble columns, the statues of learned men as well as founders of the institution, and the various other works of art that adorn the staircase and halls. But its greatest recommendation to the thinking part of mankind is, that its eight hundred thousand volumes, which fill seventy-seven large rooms, are free to every one, citizen or stranger, Christian, Jew, or pagan. This library embraces many rare and valuable works. Among them there are a great many manuscripts in Greek, Oriental, Latin, German, and many other languages. In fact, there is scarcely any work, however ancient or modern, let the language be what it may, whether printed or written, but what may be found here. Among literary curiosities is an antique Koran, very old; also the identical prayer-book of Albert Dürer—four Gospels, called the *codex aureus*, bearing date in the year 870—another four other Gospels, dated in 1024, and also one of the earliest typographical monuments, it having been printed in 1554. All the German libraries are rich in the possession of documents illustrating the progress made in the art of printing, from

century to century. One is reminded that he is to see antiquity within, as he passes up the broad stone steps that lead into the vestibule of the building. In front of the library, at an elevation of some ten feet above the sidewalk, are four colossal statues in a sitting posture. They are Homer, Hippocrates, Thucydides, and Aristotle.

Population of the States.

The increase in some of the States is very small, but none of them shows any falling off, except New Hampshire, which is the only State in the Union that has absolutely diminished in population during the last decade. The greatest proportional gain in any State is that of Nevada; but as it was the smallest of the States when it was admitted, this is no more than what was to have been expected. The largest actual gain is in Illinois—over eight hundred thousand, which brings her up to within two hundred and fifty thousand of Ohio, but leaves her as before, the fourth State in population. The relative order of the States as to population is not materially changed, but Missouri outstrips Indiana, and becomes the fifth State. Indiana is the sixth, Massachusetts is the seventh, and then follow Kentucky, Tennessee, Virginia, Georgia, Michigan, Iowa, Wisconsin, North Carolina, and Alabama—in all, sixteen States, which have upward of one million inhabitants. In 1860, there were but eleven such. Iowa has made the greatest jump in rank. She was the nineteenth in 1860; she is now the thirteenth. North Carolina, on the other hand, stood twelfth in 1860, and now drops to the fourteenth place, and Alabama now stands as the sixteenth, whereas she was the thirteenth ten years ago.

Hymn of the Present.

Not only in old days He bowed
The heavens and came down;
We, too, were shadowed by the cloud,
And saw the glory shown!
The nations that seemed dead have felt
His coming through them thrill;
Beneath His tread the mountains melt;
Our God is living still!

He who in secret hears the sigh,
Interprets every tear,
Hath lightened on us from on high,
Made known His presence near.
The Word takes flesh, the Spirit form,
His purpose to fulfill;
He comes in person of the storm—
Our God who governs still!

We saw—all of us saw—how He
Drew sword and struck the blow,
And up and free through their Red Sea
He let the captives go;
Yea, we have seen Him, clearly seen
Him work the miracle;
We know, whate'er may intervene,
Our God is with us still!

The veil of time a moment falls
From off the Eternal's face:
Recede the old horizon walls
To give fresh breathing-space;
And all who lift their eyes may learn
It is our Father's will—
This world to Him shall freely turn,
A world of freedom still!

Scientific Education.

But if scientific training is to yield its most eminent results, it must, I repeat, be made practical. That is to say, in explaining to a child the general phenomena of Nature, you must, as far as possible, give reality to your

teaching by object-lessons; in teaching him botany, he must handle the plants and dissect the flowers for himself; in teaching him physics and chemistry, you must not be solicitous to fill him with information, but you must be careful that what he learns he knows of his own knowledge. Don't be satisfied with telling him that a magnet attracts iron. Let him see that it does; let him feel the pull of the one upon the other for himself. And, especially, tell him that it is his duty to doubt until he is compelled, by the absolute authority of Nature, to believe that which is written in books. Pursue this discipline carefully and conscientiously, and you may make sure that, however scanty may be the measure of information which you have poured into the boy's mind, you have created an intellectual habit of priceless value in practical life.—*Lay Sermons, Addresses, and Reviews: Husley.*

Varieties.

IF the Indians cannot get powder and shot wherewith to hunt for support, they have ingenuity enough to devise substitutes wherewith to gain meat for their dinners. The Kaw Indians, in Kansas, are undoubtedly highly susceptible of civilization. They salt the railroad tracks. This entices cattle in front of the trains; the cattle are killed, and "Lo" gathers up the carcasses and keeps by him an abundance of roasts and soup-pieces.

An Indiana man has effected a strategical combination against the potato-bugs. He planted a grain of corn in each hill of potatoes. The corn came up before the potatoes, which, of course, cheated the little pests into the belief that it was a cornfield, and they never went near the potatoes until it was too late to do any damage.

Dr. Darwin's anticipation of the locomotive, in his "Botanic Garden," published in 1791, before any locomotive had been invented, was truly prophetic:

"Soon shall thy arm, unconquered Steam! afar
Drag the slow barge, and drive the rapid car."

As a river-boat was loading at La Crosse, a large gray mule refused to go on board. The mate sung out to a deck-hand: "Twist his tail and he'll come." Like Casabianca, that deck-hand obeyed orders, and, like Casabianca, he nobly died.

"Lothair" appears in an Italian dress in the *feuilleton* of the *Gazzetta d'Italia*, a daily paper now issued in Rome. It is translated by Mr. Robert Montgomery Stuart, a young Anglo-Italian. Under the rule of the pope, "Lothair" was an interdicted book.

The Mohammedan law of divorce is a marvel of simplicity. The husband repeats to the wife three times, "You are divorced," and the thing is done. But the wife is not allowed to use the easy formula against the husband.

Burmah has the honor of furnishing geologists with a new mineral. It appears to be a complete *mélange*, its essential constituents being arsenic, iron, and copper, mixed with occasional silver, lead, and antimony.

A New-Hampshire magistrate is under indictment for having married a matron of forty to a youth of fifteen, whom she had captured, and who states that he was afraid to say "No," when asked the momentous question.

The decrees of fashion in New York make it imperative for Fifth-avenue dogs of good family to wear black-and-red promenade-blankets, and to have the leading-strings attached to the left side of the collar.

They are fond of titles in the East. Among his other high-sounding titles, the King of Ava has that of "Lord of Twenty-four Umbrellas." This looks as though he had prepared for a long reign.

A collection of Chinese coins has just been placed in the Indian Museum. Some of them are claimed to be four thousand years old, but

it is very doubtful whether so great antiquity will be conceded to them.

How wonderful are the laws governing human existence! Were it not for tight-lacing all civilized nations would be overrun with women.

When last heard from, the Chief-Justice of the Supreme Court was shooting wild-geese in the ponds near Narragansett, thus exhibiting the living embodiment of a wild-geese Chase.

One of the "lost arts" has been found. It is believed that the principal preservative substance used in embalming the mummies of Egypt was carbolic acid in the crude state.

The critic of the London *Graphic* calls Miss Alcott's "Little Women" "an excellent description of American family-life among the poorer gentry."

News comes from Salt Lake that, at the funeral of a Mormon recently, twenty of his widows locked arms, and, keeping military step, followed the remains to the silent tomb.

If women were as particular in the choosing of a virtuous husband as men are in the choosing of a virtuous wife, a moral reformation would be soon begun.

Self-love is at once the most delicate and the most tenacious of our sentiments; a mere nothing will wound it, but there is nothing on earth that will kill it.

The Historical Society of Brooklyn, N. Y., have in their cabinet a glass bottle, the first one manufactured at a glass-factory in that place in 1754.

Albert Hopkins, of Williams College, is one of the three Americans who have been made "Fellows of the Royal Society," for astronomical discoveries.

A young man, charged with being lazy, was asked if he took it from his father. "I think not," was the reply; "father's got all the laziness he ever had."

A couple in Newport, Rhode Island, recently celebrated their pearl-wedding, having been married seventy years.

It is very considerate on the part of the law, that it "does not compel one to do impossibilities."

Last year cotton to the value of two hundred and twenty-five million dollars was exported from the United States.

A London druggist has this cheerful invitation in his shop-window: "Come in and get twelve emetics for one shilling."

In one building in Berlin there are six hundred American sewing-machines at work on clothing for the Prussian army.

It is a fact, not easily accounted for, that at parties—after supper—the guests begin to grow thin.

A veteran shopkeeper says, that although his clerks are very talkative during the day, they are always ready to shut up at night.

The population of New Jersey, as officially stated, is nine hundred and six thousand one hundred and twelve.

A Tennessee negro has been twice hanged, but "still lives."

Why is life the greatest conundrum? Because all have to give it up.

National vanity is but personal vanity magnified many million times.

Ducks have decided opinions of their own: they always come out flat-footed.

The most successful "capital removers"—Bank-robbers.

In Japan a person can live comfortably on two cents a day.

The Museum.

THE crested oriole is a native of tropical America, and seems to be rather a familiar

bird, often leaving the forests where it usually dwells, and making its home near the habitations of man. Whether in the vast woods of its native land, or whether in the cultivated grounds, it is always to be found in the loftiest trees, traversing their branches in search of food, and suspending its nest from the extremity of the slenderest twigs. It is a very active bird both on foot and in the air, one quality being needful for its movements among the boughs while getting berries, and the other for the chase of the various insects with which it varies its diet.

The nest of the crested oriole is a very elegant structure, and is much larger than that of others of the same species, being frequently, according to some accounts, more than two yards long. It is always hung from the very extremity of some delicate twig, so as to escape the marauding hand of the monkey, or the dreaded fangs of the snake; and, as a great number of these are generally found upon one tree, the combined effect, together with the busy scene of the parent-birds continually going from and returning to their homes, is remarka-

The Crested Oriole.

bly fine. The shape of the nest is cylindrical, swelling into a somewhat spherical form at the bottom; and it is found that both birds take an equal share of work in its construction.

The crested oriole is very beautifully as well as curiously colored. The head, shoulders, breast, and abdomen, are warm chocolate-brown, and the wings are dark green, changing gradually into brown at their tips. The central feathers of the tail are dark brown, and the remaining feathers are bright yellow. There is also a green tinge upon the thighs and the middle of the breast. Upon the top of the head there is a long and pointed crest and the horny portion of the bill is green, and extends above the eye. The legs and feet are black. The crested oriole is about the size of a common English jackdaw, and is thus considerably larger than our Baltimore oriole, whom he so much resembles in his habits and in the structure of his nests. The nests of the Baltimore bird, however, are chiefly built by the female, to whom the materials are brought by the male. Both species are sometimes to be seen together in South America, for the Baltimore oriole occasionally wanders as far south as Brazil.

CENTRAL SOUTH AFRICA AND ITS EXPLORERS.

I.

WHILE, for the past fifty years, the exploration of the African Continent has been the great problem, which the geographers of all civilized nations have sought to solve, it is humiliating to be

into the interior; accomplished geographers and daring explorers have encountered the perils of drought, flood, miasm, fierce wild beasts, and fiercer savages, in their efforts to lessen that vast area which is still

DAMARA GIRLS.

compelled to acknowledge how small a proportion the known regions bear to the unknown. The continent has been approached from all points, north, south, east, and west; lion-hunters and elephant-hunters have penetrated into those magnificent preserves of game, which are wholly unrivalled; traders in slaves, ivory, gold, palm-oil, cotton, and dates, have landed on its coasts, and endeavored to force their way

marked upon the maps as unknown; the missionary and the philanthropist, with the highest and noblest motives, have sought to bring light, intelligence, civilization, and Christianity, to illumine the darkened understandings of these children of the Sun; but while these efforts have not been wholly failures, and we have really made some progress in the work of reducing the boundaries of the unknown tracts

which, forty years ago, were believed to be uninhabitable deserts, still we can claim to know but little more than the coasts (and indeed not all of them), and a moderate distance into the interior, while beyond lie vast tracts never trodden by the foot of the white man.

This want of success is due mainly to two or three causes. Much of Africa is, at least for half the year, a waterless region; mountains, plains, and valleys, which, in the rainy season, bud and blossom with grasses, flowers, fruits, and thorny shrubs, are for the remainder of the year parched, dry, and dusty; the rivers are periodic, the lakes dry up, and leave a residuum of salt, and man and beast are alike tortured by thirst.

The presence of noxious insects and reptiles, whose bite or sting is fatal to all beasts of burden, and often also to man, has materially restricted exploration, and when it was attempted the luckless traveller has found himself helpless and far from aid, and has often perished by the way. During the rainy months, the fatal jungle or marsh fever, bred of the fervent heats and the rank moist vegetation, has proved a serious obstacle to the explorer; and many a brave and daring traveller has fallen a victim to it, while far from all friends, and unable to command the necessary medication, which alone gave any chance for the preservation of life.

The tribes of the interior, as well as some of those on the coast, are in many instances remarkable for their ferocity. A larger proportion of the African tribes are to-day cannibals than are to be found in all the rest of the globe.

Of those portions of the continent which have been explored, some have been traversed by a considerable number of independent travellers, whose observations have been made in a desultory way, without concert, and are often contradictory, and influenced by native reports, the most fallacious of all bases of knowledge.

It is in the hope of reconciling some of these conflicting statements, and of giving a brief *résumé* of what is known respecting a region which has suddenly come to be one of great importance, that we have attempted the preparation of this paper.

By Central South Africa, we mean that portion of the continent lying between the seventeenth and twenty-fifth degrees of south latitude. On the west coast it extends from the mouth of the Cunene River to Sandwich Bay, and, on the east coast, from the delta of the Zambeze to the newly-discovered mouth of the Limpopo near Inhampura.

It comprises the so-called Damara Land, the country of the Ova-Herero, the Ovambandieri, the Ovambo, the Hill tribes, and the Ovambundja; a portion of the Namaqua domain, the extensive region subject to Sekeletu, the Makololo chief, and the still wider territory of the crafty and warlike Mosilikatse, the chief of the Matabele. On the eastern coast, the Portuguese have the small trading-ports of Sofala and Inhambane, and have given these names to an undefined region extending back from the coast; but the Batonga, who occupy the territory near the shores of the Indian Ocean, own no allegiance except to Mosilikatse, who, however, sells a portion of his slaves to the Portuguese.

It was within the territory claimed by Mosilikatse, though by a somewhat doubtful title, that Carl Mauch, the German geologist and explorer, discovered, in 1867-'68, the three extensive gold-fields which are now attracting so much attention.

The greater portion of this extensive tract (five hundred and fifty miles in breadth, and somewhat more than thirteen hundred in length, or more than half the extent of the United States, east of the Mississippi), has been traversed by Europeans, some of it in several directions, only the eastern portion lying between the lower waters of the Zambeze and those of the Limpopo being unexplored; but the travellers have generally been elephant or lion hunters, or traders, and occasionally missionaries, of whom two or three have stations near the southern line of the tract, and six or seven have labored, for many years, in the south-western district, among the Ova-Herero and Bechuana.

With the exception of the great basin of Australia, and the Sahara Desert, there is probably no large portion of the earth's surface which suffers so much from drought as this region of Central South Africa. It is not a rainless region; for two or three months, the rain descends in torrents, the streams, rivers, marshes, and lakes are full, and vegetation is then profuse; but this rainy season is followed by intense, scorching heat, which dries up the rivers, lakes, and pools, and man and beast suffer the tortures of a consuming thirst. The cattle and the vast throngs of wild beasts wander from one river-bed, or vley, to another, or congregate where, a few months before, a broad lake

had spread over the savanna, or had partially filled an extensive valley; but now they find only hardened clay or glittering salt, with occasionally a pit-hole, where the shallow brackish water has been hopelessly fouled by the feet of the elephants, or the wallowing of the buffaloes. The grasses soon dry up and wither under the intense heat, which often reaches 116° Fahr. in the shade, and as often falls in the night to 40° or 45°; but the shrubs and trees, in which the cactus, the thorny acacias, and the baubiniacs, predominate, are well adapted to the climate, and thrive when every thing else is scorched.

This, and the southern portion of the African Continent, are remarkable for the variety and formidable character of their thorn-trees. They are almost exclusively of the acacia family, and "their name is legion." The camel-thorn, the hack-thorn, the hooked-thorn, and the expressively-named wait-a-bit-thorn, with a score of others almost as formidable, occur in vast jungles over the whole territory. The mopané, a baubinia, grows straight and tall, but selfishly folds its leaves in the noontide heat, and affords little or no shade. The omumborombonga, which is found in considerable abundance in the hilly regions of the west coast, in Ova-Herero-land and eastward nearly to Lake Ngami, is a large tree, and affords a tolerable shelter from the heat, and its iron-like wood is of considerable service, where tools can be found hard enough to cut it. The Ova-Herero pay a sort of homage or worship to this tree, believing it to be the parent of their race. The water-shed between the Zambeze and Limpopo, and that between the Cunene and Swagoup, in the west, seem to be also the boundaries between the tropical and sub-tropical flora and forest-trees of Africa. South of this elevated plateau are acacias, baubiniacs, cacti, and fan-palms; north of it, fewer thorns, but more of the feathery, the cocoa, and the doum palm, the great creeping plants, and the exuberant vegetation of the tropics.

Yet even amid this formidable and apparently worthless vegetation, we find evidences of the thoughtful care of the Creator for His creatures. Several of the palms, and some of the bamboos, contain pure water in considerable quantities stored away in their trunks; and even the sand-hills of the west coast, seemingly the most desolate and forbidding of all dwelling-places for human beings, are covered after the rainy season with the delicious *nara*, a prickly gourd, or cucumber, whose harsh spines cover a rich and luscious pulp, and seeds which, when roasted, are equal in flavor and nutrition to the chestnut. Buried in these sand-heaps, too, are numerous bulbs, some resembling the onion in odor and nourishing qualities, others belonging to the yam family, while others still approximate to the *taro*, or bread-fruit of the Polynesian Islands. In the interior, wherever cultivation, be it ever so rude, is practised, the holcus, or millet, of several varieties, yields large returns, and the sweet sorghum as well as some of the taller grasses, furnish edible seeds, in addition to the saccharine juices of the stalks. Several of the hard-wood forest-trees, as well as some of the bamboos and shrubs, retain, for months during the dry season, the water which has found its way into their cavities during the rains, and thus furnish a moderate supply to the thirsty native tribes, and to some of the smaller animals.

The *nara* is an invaluable fruit to the inhabitants of the sandy regions along the west coast. Its pulp, when divested of the prickly skin, is juicy, sweet, and refreshing, and is not only eaten in its fresh state with great avidity by man and beast, but is made into a paste and dried, when it forms a much-prized article of food for many months. Its slender fibrous roots penetrate to a great depth through the sand, and always reach moisture.

In the interior, around Lake Ngami and farther east, several of the rushes have edible roots, some of them of very pleasant taste, and equal to the yam or the turnip in nutritious qualities. The hippopotamus and some of the water-bucks feed upon these.

Central South Africa, with all its drawbacks of climate, drought, thorns, and savage tribes, is the paradise of the sportsman and the naturalist. Nowhere can he find in such profusion the largest game for which the hunter seeks. The huge elephant of South Africa, often from eleven and a half to thirteen or even fourteen feet in height, having been driven by the progress of civilization, and the constant pursuit to which he was subjected, in the basin of the Orange River, to seek a new home, has taken up his abode in the jungles and thorn-protected vleys of this region. Harris, Green, Andersen, and Chapman, could each boast of having slain a thousand or more of these noble animals, and the three latter, on more than one occasion, brought down ten or twelve each, in a single day. Lions, though not

as numerous, are quite sufficiently so to be a terror to the natives, and not unfrequently acquire that taste for human flesh which emboldens them to enter the Damara, Namaqua, or Makololo villages, and snatch up a victim, whom they quickly devour. The rhinoceros, of which the naturalists enumerate three or four species in this part of Africa, one or two white, and two black, differing in the number and curvature of their nasal horns, as well as in color, are also plentiful. The rhinoceros is a vicious brute, especially when wounded or pursued, and, though less formidable than he has been represented, is not a pleasant fellow to confront, unless the hunter has perfect confidence in his ride, and his ability to penetrate the dense hide of the beast. The hippopotamus is found in considerable numbers in the Zambeze and Limpopo, as well as in Lake Ngami and its principal affluents, the Okorango, Cholee, and Tiouge. When irritated he is very destructive, and is much dreaded by the natives. In all these rivers the crocodile is his companion, and one by no means amiable in his disposition or habits.

The buffalo of South Africa, the most formidable and ferocious of his tribe, is also abundant in this region. With his great horns; his long, shaggy mane and foretop; his fierce, inflamed eyes, and his headlong gallop, he is not an agreeable customer to meet, especially when, at the head of a large herd, he is seeking for water, and already maddened with thirst. Like the African ox, he sniffs water at a long distance, and it must be a strong barrier that can resist the plunge of the infuriated herd as they rush toward it. A regiment of the best European cavalry, standing in their way, would go down in a moment before the headlong charge of a herd of buffalo-bulls in search of running water.

Less formidable, but very fleet of foot, are the wild equine or asinine tribes of animals, which are only found in large numbers in South Africa—the zebra (two species); the quagga, of two or three species, and the dauro, an intermediate link between the two. The quagga and the dauro are eaten with great relish by the South-African tribes, to whom, indeed, hardly any thing in the way of flesh comes amiss; but the hunters, who are somewhat more fastidious, speak of the flesh of both as being very palatable, though somewhat coarse-grained.

The gnu (the wildebeeste of the Boers), of which there are certainly three, and perhaps four, species, is found in great numbers from the east to the west coast. He seems to be a connecting link between the buffalo, the quagga, and the antelope, having the head and horns of the first, the body and movement of the second, and the delicate limbs and fleetness of the third. Though classed at first with the antelopes, the naturalists have finally made a special genus for him. His flesh is excellent, and in some parts of the region we are describing is the great dependence of the natives.

But it is in the variety and beauty of its antelopes that Central South Africa is most remarkable. No other country on the globe has half so many species. Chapman, one of the most careful observers among the South-African hunters, enumerates over twenty distinct species, four or five of them water-bucks, or accustomed to wade and swim in the great rivers of the country. Of the whole number the eland is the largest, weighing often over one thousand pounds. The hartebeest (*Antelope canna*) is almost as large, and both are susceptible of domestication. The koodoo, the springbok, the klipspringer, the kleinbok (a very delicate and beautiful little antelope), the blaubok, the reitbok, the pallah, and the gemsbok, are the species most abundant, and all of them are swift of foot and of very delicate habit. The camelopard, or giraffe, is found in considerable numbers in the elevated plateau extending from the country of the Hill Damaras to the vicinity of Lake Ngami, and is often hunted by the daring adventurers who traverse that country for ivory. There are also leopards, panthers, wild-boars of great size and ferocity, wolves more mischievous and destructive than formidable, hyenas of large size, jackals, and great numbers of half-wild dogs, a sort of cross between the wolf and the hyena, and retaining the characteristics of both. Of birds, there are great numbers of ostriches, and the hunting of them and their nests, for the plumes and the eggs, is a favorite sport of the Damaras and Bushmen. Success in this hunt is attained rather by skill and tact than by speed. The Bushman disguises himself in an ostrich-skin, whitens his legs, and, adroitly manipulating his disguise, makes his way among the flock, and, when in a favorable position, lets fly an arrow and kills one of the flock. The fall of one of their number surprises the rest, but, as they cannot discover the cause of his death,

they do not run, and the Bushman often succeeds in killing a half-dozen before they become alarmed. The adjutant, the secretary-bird, the king-vulture, and the eagle, are among the principal birds of prey. Of gallinaceous birds, there are the guinea-hen, and three or four other species of grouse, partridges, geese of great size, ducks, teal, snipe, etc., and on the coast penguins, gannets, auks, and other marine birds, which have made the islands of that vicinity their homes, in immense numbers, for centuries. Sharks abound at the mouths of the rivers, which, as well as the lakes, are pretty well stocked with fish.

The reptiles are numerous and formidable. We have already spoken of the crocodiles; huge pythons, cobras (the *naja* of Hindostan), puff-adders, and other venomous ophidians, are also abundant.

The lizard tribe, and batrachians of all sorts, are well represented. Scorpions, centipedes, thirty or forty kinds of spiders, some of them intensely poisonous, hornets of great size and formidable sting, numerous species of wasps, and, in extensive districts of the eastern portion of the continent, the tsetse-fly, so destructive to cattle and horses, gnats, and mosquitoes of most malicious nature, the tick-insect, the great termites, or white ants, black ants, and a large blistering fly, are a few of the insect pests of this country.

It would hardly seem that there were sufficient attractions about such a region to secure a large population, or that men of refinement and high intellectual culture, after a year or two of experience of the annoyances, sufferings, and privations, which are inevitable to the traveller there, would become so fascinated with the country as to return to it again and again, and finally make it their home. Yet, this, inexplicable as it may seem, has been the effect produced on a number of accomplished and refined Englishmen. We can understand and admire the heroic and self-sacrificing disposition which may lead a missionary, for the love of the souls of the heathen, to give up all the comforts of civilization, and settle in such a country, and among a people with whom any considerable association is impossible, in the hope of doing good to those who are so degraded and barbarous; but that, for the love of the chase, from the enthusiasm of the explorer, or from the hope of gain, a man should thus exile himself from all that makes life desirable, seems incomprehensible. But, before speaking of the explorers of this region, let us describe briefly the native tribes who inhabit it, for some portions of it are, when the character of the country is considered, quite populous.

These tribes, except the Namaquas, found on the southern border and in the southwest portion, and the Bushmen, who are the dependants of the Ovambo and Bechuanas, are all of the Kaffir, or, as Wood calls them, the Zingian family. That this family is a distinct race, as much so as the Malay, the Mongolian, or the American Indian, is becoming more certain with each new discovery in relation to the language, features, habits, customs, and religious notions, of the several tribes belonging to it.

The Zingian is generally of good height, often six feet or more, his features are nearer to the Caucasian than the Negro, though the lips are somewhat thick; the nose is well formed, the cheek-bones not high, nor the face particularly broad. The hair is crisp and curly, but not woolly; the feet and hands, as well as the limbs, shapely. Their color is an iron-bronze, exhibiting a marked difference from the glossy satin-like blackness of the negro.

The youth of both sexes are finely formed, and often, despite their color, possess a certain statuesque beauty. This is especially the case with the young girls of the tribes, who are really often graceful and attractive. Their beauty soon fades, however, and, amid the hardships of savage life, the sylph of fifteen degenerates into the hag at thirty. There are, of course, differences of character, of habits, of cleanliness, of modesty, of intelligence, of courage, of dialect, and of religious usages and traditions, among the different tribes, just as there are national differences in some of these particulars between the English, the Dutch, the Germans, and the Danes, or other Scandinavian nations. The Matabele or Amatabele, the people who acknowledge Mosilikatse as lord-paramount, are more courageous, resolute, and cruel, than the tribes farther west. They are said to be more truthful, and not such inveterate beggars. The Batonga, or Batuka, another of the tribes occupying the eastern portion of the territory, are more intelligent, industrious, and well-disposed, than the other tribes. The Makololo, with whom Dr. Livingstone has made us familiar, are a crafty, deceitful tribe, great beggars, ready to promise any thing, but utterly careless respecting the performance of their promises; less courageous than the Matabele, they are more greedy

and rapacious. They are the subjects of Sekeletu, a daring and unprincipled leader, who commenced his career as a ruler, by the slaughter of most of his relatives. West of these, we find a smaller tribe, the Bakoba, or Bayeiye, of greater intelligence and manliness than their Makololo neighbors, and whose chief, Lechulatebe, though nominally subject to Sekeletu, is really, in most matters, independent.

All these tribes are known to travellers by the general name of Bechuanas, and all speak, with but slight modification, the Sechuana language, a dialect of the Kaffir, or Zingian. Still farther west, and beyond Lake Ngami, are several tribes, differing from each other and from the Bechuana tribes in habits, manners, and mode of life, yet speaking allied dialects, and so far resembling them in form, features, and general character, that they must have sprung originally from the same stock. Of these, three tribes are specially noticeable, the others being offshoots from them; these are the Ovambo, the Ova-Herero, or Damaras, and the Ihaukoin, Ovambautieru, or Hill Damaras.

The Ovambo are a finely-formed, erect, and warlike tribe, of considerable intelligence, a pastoral and hunting people, who possess large herds of cattle and sheep, and wage incessant warfare with the wild beasts, which abound in the plateaus and ravines of their country. They have a capital, Ondonga, a somewhat populous village, though wretchedly built, the houses being of bamboo or reeds, wattled with clay, and with a conical thatch of rushes. Their king, Naugoro, is said to be the only corpulent man in the country, and he is a mountain of flesh. Anderssen and Galton thought him a stupid, greasy, and somewhat malicious savage; but he seems to have been, after all, intelligent enough to be crafty, and possesses more power and a wider sway than any other chief of this part of Africa, except Sekeletu and Mosilikatse. He professed friendship for the European travellers, but afterward sought to destroy them and the missionaries by a sudden surprise and assault. He was baffled in this attempt, and his warriors driven back with heavy loss. It is possible that he was prompted to this outrage by a subordinate chief, for he subsequently treated the missionaries and Anderssen, Green, and Chapman, with kindness.

The Ovambo have many excellent traits of character. They are very respectful and tender to the aged and infirm, differing in this respect from the Damaras and the Bechuanas, who neglect the old people and the sick, and, indeed, often hasten their death. They are honest, though, like most of the Zingian tribes, they are great beggars. They are industrious, both men and women laboring assiduously and patiently. The women are chaste, and, in their way, modest, affording in this respect a marked contrast to the Namaquas and other Hottentot tribes, whose country is adjacent to theirs. Polygamy is practised, though for the most part only by the chiefs, the cost of each

additional wife being very great. Still, the Ovambo, as well as all the other tribes of this region, regard polygamy as one of their reserved rights, to be called into active exercise whenever they can afford it. Chapman tells us that Rev. Mr. Hahn, a very earnest and devoted missionary among these people, after many years' labor among the Damaras, whose practice on this point is the same as that of the Ovambo, at last thought he had made a convert—a young Damara who had but a single wife, and whose serious and consistent conduct had inspired the missionary with high hopes. He had questioned him in regard to his religious views, and received very satisfactory replies. At last Mr. Hahn bethought him to propose the crucial question, "Are you willing to give up the prospect of taking one or more additional wives, for the sake of pleasing God?" The Damara replied, very seriously, that he was willing to make great sacrifices to please God, and he thought he had manifested a disposition to do so;

but that was a sacrifice he could not make, and he did not think God had any right to require it of him. The Ova-Herero, or Damaras, twenty or five-and-twenty years since, were, in almost all respects, the most prosperous and civilized tribe in all the southern portion of the African Continent. Enterprising and industrious, they possessed immense herds of cattle, which they pastured on the lofty plains and among the valleys and ravines of Herero-Land; they cultivated the soil in a rude way, but obtained very respectable crops of millet, sorghum, barley, pumpkins, and bulbous vegetables; they smelted iron, and manifested considerable skill in the manufacture of agricultural

BECHUANAS.

and hunting implements; they were adroit, also, in some of the domestic industries; from the skins of the antelopes and the giraffe (which they tanned skilfully), and the tails of some of the smaller animals, they made karosses or skin-garments of great beauty; and from the feathers of the ostrich and other birds they wove graceful head-dresses. Dress, in that country and climate, is scanty at best; but the Damaras were, for their time and nation, well clothed. Good roads traversed their country, and their government and regulations gave indications of a mastery of the principles of political economy, which would have done credit to a more civilized nation. They were honest and trusty, and hunters and traders who entered their country to trade, or to hunt elephants, found little difficulty, if they were of reputable character, in procuring some wealthy Damara to become their bondsman or friend (*omaru*), who, in accordance with their laws, would stand as surety for them, guaranteeing that they would not leave the country without paying all their debts.

The religion of the Ova-Herero was not an idolatry nor fetichism. They recognized a Supreme Being, of benevolent character and great power, whom, however, it was possible to offend; and their code of morality, if short, was comprehensive: it included reverence to God; worship offered to Him through His symbols, the fire and the sun; the preservation of the sacred fire perpetually (not an easy or pleasant matter in that torrid climate) under the charge of a vestal virgin, usually the eldest daughter of the chief; honesty, chastity, and kindness toward our fellow-men. There were points in which this creed was defective, but it was a great advance on the religion of most of the African tribes.

The past twenty years have witnessed the ruin of all this fair fabric of national prosperity, and affords another proof, of which we find so many in Africa, that the progress of most of the barbarous and semi-civilized nations, instead of being, as Darwin and his followers assert, from the lowest plane to a higher one, is ever from a comparatively high plane to a lower one, and that, whether they belong to one race or another, the degeneration is very rapid, and a subsequent return to their former condition difficult, if not impossible.

The Namaquas, a Hottentot tribe hitherto regarded as cowardly and debased, under the lead of Jonker Africaner, a robber chief of considerable force of character, made an incursion, about 1850, into the southern border of the Ova-Herero territory, and plundered from the peaceful inhabitants a considerable number of cattle. Encouraged by his success, Jonker Africaner continued his forays, in which he has been joined by some other chiefs, till he has overrun the entire territory of the Ova-Herero and reduced them to a condition of poverty and wretchedness. Had they possessed any competent leaders, they might easily have repelled these assaults, for the Namaquas are

cowardly and easily repulsed, but they were a peaceful people, and submitted almost without resistance to the despoliation of the invaders. The Ihaukoin, or Hill Damaras, on whom the Namaquas next attempted a raid, though usually reckoned more timid than their neighbors, the Ova-Herero, yet fought the Namaquas with such fierceness, that they fled back to their own country, and have never since renewed their attempt. The Ovambo also resisted them successfully.

Since this wholesale desolation of their country, the Ova-Herero have maintained a precarious existence, by hunting the wild beasts of their mountainous districts, and, at the seasons when they cannot kill these, they live on the bulbs, roots of rushes, etc., which they eat raw. They are almost constantly in a famishing condition, and hundreds of them will follow the hunter, begging, in the most abject manner, for food; and, when an elephant, rhinoceros, giraffe, buffalo, or eland;

is shot, they are so ravenous, that it is with difficulty that the hunter can obtain a single steak or roasting-piece for himself, the hungry wretches fighting for every morsel, and eating the blood, intestines, etc., in a nearly raw state, and even roasting and gnawing the skin of the animal.

Their ambition, pride, and love of ornament, have all disappeared, and, with them, their really high intellectual qualities. They are content with the merest rags, of whatever texture they may be, to hide their nakedness; and some of them even live in a state of perfect nudity. Their religious system, which seems to have looked back-

THE OVAMBA.

ward to a Parsee origin, has gone to wreck with their prosperity, and now both Chapman and the missionaries say they are averse to any mention of God, and, if they worship any thing, it is the Omumborombonga, or ironwood-tree, from which they claim that they descended. The gratification of the mere animal instincts of hunger and thirst seems to absorb their whole thoughts and intellect. The language shows conclusively that they were at one time an intellectual and philosophical race. Its numerous prefixes; its nice shades of meaning, different words or prefixes being used to indicate distinctions, of which a savage nation would have been incapable; and its alliterative character, rendering it one of the most mellifluous and poetic of dialects—all give evidence of a former high condition of civilization, and to this agrees the testimony of the missionaries who knew them nearly thirty years ago.

Such a degeneration, occurring in so short a period, seems very sad; but it throws light on the history of many of the savage tribes on this continent and elsewhere, and shows how speedy may have been the fall from the comparatively high culture of the race inhabiting Mexico in the sixteenth century to the stupid and unintellectual life of the Pueblo Indian, or the deep degradation of the Digger Indians of the Great Salt Lake Basin.

All the Zingian dialects are flowing and mellifluous; the vowel and liquid sounds predominate; and the "click," which is so marked a characteristic of all the Hottentot languages, is entirely wanting. The Sechuana, which is spoken almost over the whole breadth of the continent, is distinguished, like the Ovambo and Ova-Herero, for its numerous prefixes, which are mostly pronominal in signification, and for the minuteness of its distinctions of sex, color, descent, form, size, etc., as well as for an unusual number of abstract and metaphysical terms, for a people no higher in civilization than they now are. The present condition of the people is due, probably, in part to the protracted droughts from which they so often suffer; the great number of beasts of prey; the prevalence of the tsetse-fly in some districts, which renders the rearing of cattle impossible; and a destructive murrain, which has, within a few years, destroyed the larger part of the cattle and horses in the districts not subject to the "fly;" and, more than all else, to the existence and prevalence of slavery in the eastern part of the continent. The Portuguese slave-traders have made large offers of goods suited to savage tastes to the Matabele, to induce them to bring them coffles of slaves. These people, who were not naturally warlike, having found in the traffic in slaves the means of restoring and increasing their wealth, have entered into it with great zeal, and are not only making war upon the more peaceful nations around them, to procure slaves, but are largely selling their own children into slavery. The movements of this formidable tribe, always ready for predatory incursions in the east, have demoralized the other nations across the continent. At the slightest alarm, the Makololo, the Batonga, the Batuka, and the other Bechuana tribes, will leave their homes, and fly to the woods with the despairing cry, "The Matabele are coming—are coming to make slaves of us!" Of effectual resistance they seem to have no idea. Such a condition of affairs renders any successful cultivation of the soil or care of herds and flocks impossible; and it is a great and good work in which Dr. Livingstone has sought to interest the government of Great Britain—that of breaking up the slave-traffic, internal as well as foreign, on the east coast.

L. P. BROCKETT.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER V.

It seemed to Daisy that Myrrha grew lovelier every day. Daisy would sit and watch her till the girl would look up from book or drawing to ask, "What is it, Aunt Daisy?"

"It is that you are so lovely, Myrrha, and that I wish, I wish I could be sure you are even half as good and true as you are lovely."

Flattered by this admiration, Myrrha answered affectionately:

"At any rate, auntie, I hope I'm not, as times go, and girls, very bad."

It did not seem to Daisy possible but that this loveliness should exercise at least as strong a fascination over Mr. Stewart as it did over her. Mr. Stewart was quite ready to admit it would be difficult to find a fairer creature than the girl who rode beside him. The soft

spring wind, and the exercise in which she delighted, brought an ethereal bloom upon her young face, made her gleesome eyes shine crystal clear, gave her fresh lips a more vivid red, and lent even her hair a brighter gloss, so that the netted-up mass looked like imprisoned sunshine.

Those rides together had come to be an all-but daily institution. It was long now since Myrrha had been spoken of between Mr. Stewart and Daisy. Mr. Stewart had left off talking of the probability that "business" might call him away.

It was toward the end of June that Myrrha went, prettily and appropriately, through the farce of "discovering" (what she had some time known) that Mr. Stewart and the owner of Redcombe were one and the same person. About this time Mr. Stewart announced to her that the owner of Redcombe, having heard of a strange and lovely princess in the neighborhood, who had a passion for croquet, and for garden-parties, had determined, on a certain day, to give a *fête* in honor of the fair unknown, and had had a croquet-lawn, pronounced by competent judges to be admirable, prepared for the occasion. Myrrha at this lifted to Mr. Stewart a face so radiant with surprise and delight, that Mr. Stewart felt something of pleased tenderness toward such frankly-shown pleasure.

"The owner of Redcombe is a friend of yours, then, Mr. Stewart? And you've been telling him about me. How very, very kind you are to me! I don't know what I won't do for you! I've suspected something of this, do you know, Mr. Stewart? He must be a very dear friend, for I've learned that our horses come from his stables, and—"

"You're quite wrong, Myrrha, as to his being a very dear friend. On the contrary, he's my worst enemy."

Myrrha looked him in the face long and scrutinizingly.

"I know what you mean!" she then cried, delightedly. "A man is said to be his own worst enemy. You are the owner of Redcombe. Oh, Mr. Stewart, if I loved (I mean liked) you before, shan't I love you ten times over now!" All this said with sparkling eyes and eager lips, that looked quite ready to kiss him, if only he would bend toward them. "And you are going to give this *fête* for me? You are kind—"

"I give it to amuse your Aunt Daisy's visitor!"

"That is meant for a snub, but I won't take it as such. I know every thing will be delightful! I know I shall enjoy myself as I've never done in my life before."

And when the day came it proved to be one of Myrrha's golden days—till toward its close, when it clouded over. All through the day Mr. Stewart so distinguished her that it must have been evident to all eyes that she was the queen of the *fête*. She more than once heard herself pointed out as the young lady Mr. Stewart was soon to marry; for, of course, their constant riding together had set such rumors afloat. Then, again, every thing was admirably managed; she found golden traces of wealth everywhere, and Redcombe manor-house far surpassed her expectations. She was delighted with every thing, and showed her delight with the most complete abandon. What she had said to Mr. Stewart, "That if she had loved him before, as the owner of Redcombe she loved him ten times over," seemed true in the very simplicity of truthfulness. She tried to be composed and dignified; she wished Mr. Stewart to feel that it was no mere child he was distinguishing, but a woman quite capable of well playing the part of mistress of Redcombe Manor on some similar future occasion.

Against her will, however, the croquet-lawn attracted her; although Mr. Stewart did not play croquet, she lost herself in the game, as legitimate part of which she considered light flirtation with all the men engaged in it. She received delicious homage, and, for the first time since she came into the neighborhood, felt herself appreciated. Every other girl, cast into the shade, turned sullen, and every man seemed ready to fall upon his knees. For a brief while she forgot her wisdom, and turned aside from the serious ambitions of life. The beauty of the day, the gayety of the scene, the consciousness of her own preëminent loveliness, the almost as delicious consciousness of the exquisite perfection of her dress, intoxicated the nineteen-years'-old creature. By-and-by, after an hour or so, and when this sort of wholesale flirtation was growing fast and furious, Myrrha suddenly came to her more sober self, seeing Mr. Stewart, sitting by Daisy, watching her amusedly.

"This is all very pleasant, but it won't pay now, it can come

after," was the substance of Myrrha's reflections. As soon as she could, and not too ceremoniously, using her spoilt-beauty air, she disengaged herself from the players, and joined her Aunt Daisy and Mr. Stewart.

"Will you please take me somewhere to have a cup of tea?" she asked Mr. Stewart. "I'm so tired and so thirsty!"

"Won't you come too?" Mr. Stewart asked Daisy, as he rose, and offered Myrrha his arm; but Daisy, who was talking to an old lady who had just joined her, did not hear the question.

"I'm sorry you're tired already, fair frivolity!" Mr. Stewart said. "The day is not half over."

"I only mean tired of croquet. It's a stupid game; but, somehow, one gets excited over it."

"So it seems."

"Why did you call me 'fair frivolity'?" You shall not call me such an ugly name!"

"Ugly!" I defy any one to call you any thing ugly. We were saying just now—your Aunt Daisy and I—that we had never seen a more lovely or a more happy-looking creature."

"Well, Mr. Stewart, I am happy to-day. I do enjoy myself. It is all so beautiful, and the thought that you planned it all for me, is certainly not the least cause of my happiness."

"For your Aunt Daisy's guest," corrected Mr. Stewart.

Myrrha made a grimace.

"You won't be so cruel as to try to spoil all my happiness," she said. "You will spoil it all if you call me frivolous."

"I will call you only fair, then."

"The fact is," continued Myrrha, "I am so happy to-day that I want to be still happier."

"Insatiable human nature. Let us hope that, as you are beginning to be tired, the cup of tea, of which we are in pursuit, will, by refreshing you, increase and prolong your happiness."

"I won't be shut up in that way, Mr. Stewart," said Myrrha, pointing, and giving the arm her hand was on a sharp pinch. "A cup of tea is a good thing, and I shall be glad to have it, but I want more than that. I want to know, just really and truly, that you don't dislike, or altogether despise, me."

"My dear young lady! your thoughts and your words are wild! Dislike you! Despise you! Why should I, how could I, do either? I dislike you, and despise you, as much as I should dislike and despise some lovely flower because it did not happen to be my favorite among all flowers."

Poor Myrrha paused. She was quick enough to feel to the full all that was hidden in this answer.

"Have you a favorite flower, Mr. Stewart?" she asked, after that pause.

"The flower that was Chaucer's worship is mine."

Myrrha's "Ah!" was so significant and intelligent, that he felt sure she was in the dark as to what he meant.

"You remember, no doubt," he went on, "Chaucer's account of how he used to rise early, and go far, to see the first sunbeams fall on his favorite, and of how he would spend a day content lying on the grass encircling his flower with his arms?"

A thrill in Mr. Stewart's voice perplexed Myrrha; she looked up into his face, and saw a strange light there.

With a vague recollection of having heard of Chaucer's Romance of the Rose, Myrrha said, after a few seconds of reflection: "Now I shall know of whom to feel jealous. I shall look out for your rose."

"The rose is such a universal favorite, Myrrha! Would you have thought me the man to worship at the shrine at which all offer homage?"

"I don't know that I understand you to-day. Tell me what flower you would give me as my emblem?"

"Let me see!" He looked at her investigatively. "If you will come to the conservatory, I will show you a new geranium, the 'bride!' to which it seems to me, you, in that delicate dress, bear a wonderful resemblance."

"Well," said Myrrha, after looking at the flower, "it's pretty enough, but it has no sweetness; and—do you care for geraniums, Mr. Stewart?" looking up into his face wistfully.

"Care for" is one of those indefinite feminine expressions a man doesn't exactly appreciate. I admire the 'bride.' Who could help admiring such an exquisite creature?"

Then they passed from the conservatory into a room where a stately elderly lady, his housekeeper, was dispensing tea.

"This is a charming room!" exclaimed Myrrha. "Just a little lightening up, and it would make the most delightful ladies' morning-room."

"When the 'bride' comes to Redcombe, if, indeed, she ever comes, she will make many alterations, doubtless. I leave the whole place alone till she issues her commands."

Myrrha looked at Mr. Stewart, then looked down; she wished to blush, but her delicate complexion was not of the blushing sort.

Other people came and went, and Myrrha kept Mr. Stewart at her side, engaging her in a half-sentimental war of words, speaking low, so that he might need to bend down to hear her, conscious that elderly ladies watched them curiously, and young ladies watched them enviously; leaning back in that "delicious" chair, Myrrha was lazily happy. The eyes raised to Mr. Stewart's had a soft languor in them which rather startled him; he did not believe in much real softness in Myrrha; he had judged her nature to be rather cold and hard, and, as it were, thin; yet, perhaps, he was mildly flattered at the marked preference of a creature so young and so lovely. "Marked preference for Redcombe over any other home of which she has believed she had the chance," Mr. Stewart inwardly commented. But perhaps the cynicism of the comment was somewhat forced.

Myrrha kept her position, and so kept Mr. Stewart beside her till she fancied she saw signs of restlessness and of wandering attention; then she said:

"Mr. Stewart, don't you think poor dear Aunt Daisy will feel neglected if we don't go and look for her?"

This "poor dear Aunt Daisy" annoyed Mr. Stewart. "I have, for some time, been wishing to rejoin her," he answered.

"I do think you are the most terribly ungallant man I ever met. To punish you for that atrocious speech, you must, before we leave the house, show me the library. Ah! Mr. Stewart, this is a grand room," she said, looking round it with eyes that, for a moment, seemed reverent. "If I might come and read here," she said, coaxingly; "if you would tell me what books to read, and what I ought to think about them! If you would teach me a little! If you would spare me just one hour every day for a reading-lesson! Why do you shake your head?"

"Too dangerous a position for me to play school-master to so pretty a pupil."

"I wish I were not pretty, then, Mr. Stewart."

"Excuse me for saying, I doubt the sincerity of that wish."

"I don't much care about being only pretty. I should like to be beautiful."

"Beautiful in the way your Aunt Daisy is, for instance? But it needs a great deal, to gain that sort of beauty."

"I suppose you are jesting, Mr. Stewart; but it is not pretty of you to laugh at poor Aunt Daisy."

"Miss Brown, you know better than to suppose I am jesting. I say, your Aunt Daisy is beautiful."

"Then, if that is beauty," said Myrrha, losing her temper all at once, "to look old and worn, to have irregular features, and no complexion to speak of, I retract my wish to be beautiful. But, either you are jesting, or you are most extraordinarily infatuated."

"It is certainly not a subject on which I should choose to jest. I am quite willing to grant that you are far prettier than your aunt. Your features are not irregular, you have a complexion to speak of, you are in the first fresh bloom of youth; but I maintain that your Aunt Daisy has a higher kind of beauty."

Myrrha paused before speaking, then she said: "I know I have made you angry, because you call me Miss Brown. I am more sorry than I can say. You had been so kind to me. And now my happy day is spoilt. But, I can't help saying, it is very extraordinary, Mr. Stewart, that you should be so deluded about Aunt Daisy. Your admiration of her character perplexes me. I have the feeling that some day you will know her better, and see her differently, and then—"

"Miss Brown, pause in time. You are wise; don't let your feelings carry you so far that you say what I could never forgive."

Myrrha took his advice; she did pause—they were just then walking down a shady and solitary beech-glade. She took her hand from his arm, and, leaning a moment against a beech-trunk, indulged in a short, a very short, storm of tears. Mr. Stewart merely waited. In

a few minutes she passed her embroidered handkerchief lightly over her face, then looked up into Mr. Stewart's.

"Does it show? Are my eyes red? Do I look as if I had been crying?"

"Not in the least."

"Now, Mr. Stewart, I am not going to move from here, till you forgive me and call me Myrrha again. I don't think I am much more to blame than you are. You don't know how you hurt me. You are always showing me how frivolous and empty you think me—how you despise me. You never seem to believe in me, if I show any desire to be different; if I own how I long to have some one, strong and true, and on whom I could rely to help me, you ridicule me. You have been very, very cruel to me, just, I suppose, because I have shown frankly how I like you, how I desire your kindness. This was such a happy day, because you seemed to like me to-day; and now it's all turned to bitterness, and I'm very unhappy." Her eyes were full of tears, and her voice was ominously excited. "No, I won't, won't, won't move, till you call me Myrrha, and say something kind to me!"

"We will talk of all this some other time, Myrrha. Come, take my arm again. Forgive you? Yes, I forgive you—and you must forgive me, if you have any thing to forgive, and, if what you say is true, you have a great deal."

Myrrha, after a suppressed sob or two, took his arm, and let him lead her to where, more than an hour ago, they had left Daisy, and where Daisy still sat.

A day or two after this, Myrrha met Mr. Stewart with the words:

"I've found it out, Mr. Stewart: it is not the rose that is your favorite flower, though you let me think so. I have found out what is your favorite. I came, quite accidentally, in a book I was reading, upon a quotation from Chaucer, in which he speaks of the 'Day's Eye,' and of his love for it—"

Mr. Stewart rightly concluded from this explanation of Myrrha's, that she had been studying Chaucer, purposely to discover the passage.

"Well," he said, "I hope you approve my taste and Chaucer's?"

"Oh, of course?" Then, after a pause, "Will you forgive me, I wonder, if I ask a very rude question?"

"I will try to do so; but might it not be better, if the question be a rude one, to leave it unasked?"

"I cannot. I am too interested in having it answered; but—I'm afraid you'll be so dreadfully angry!"

"You take the choice, you see, between risking my dreadful anger and losing the chance of gratifying your curiosity."

"It is much more than mere curiosity."

"And it will be, I dare say, much less than 'dreadful' anger."

"It is only this: I want to know, Mr. Stewart, why you don't marry Aunt Daisy?"

"Is it only that you wish to know, Miss Brown?" Mr. Stewart's face reddened angrily. Myrrha, seeing this, and hearing the tone in which he called her Miss Brown, hid her face in her hands, and looked out at him from between her fingers, pretending to shrink away. "The question is very easily answered. I don't marry your Aunt Daisy, because she won't let me; because she won't marry me. There is no other reason; there can be no other; but this, you will allow, is a sufficient one."

"Aunt Daisy says she will never marry, and she says it in a way that shows she means it."

"Of course she means it; your Aunt Daisy always says what she means."

"No, Mr. Stewart; Aunt Daisy, I dare say, always means what she says, but she means, also, a great deal she never says. She is very secret; I feel quite certain that Aunt Daisy conceals something very important. It has crossed my mind to wonder whether she may not be already married!"

Mr. Stewart laughed derisively. "So, you've been making your Aunt Daisy the heroine of a sensational novel, have you?"

"Mr. Stewart, you promised your anger should be less than dreadful; but it isn't, you're dreadfully angry; and it isn't fair you should be. If you knew my reasons for touching this subject, if you understood my heart on this subject, you would, at least, pity me."

Something rose to Mr. Stewart's lips, which he preferred not to say; he turned from Myrrha abruptly, and went into the house; she

had waylaid him in the garden. But she contrived to speak a few more confidential words to him before he left.

"If you had been a little more tolerant with me, I, perhaps, could have told you things that might have been useful to you. Yes, you needn't look so superbly scornful; though I am but 'a child of nineteen,' as you've told me often enough, and you are a man of forty—still, I am a woman, and you're only a man, and women know by instinct things that men's reason and wisdom never seem to teach them. Of course, if there is really between you and Aunt Daisy some insuperable obstacle, nothing will be of any good; but if there is nothing but some foolish fancy of hers, there is a thing that would help you—to make her a little jealous. Oh, yes, I know you think this a reasonable suggestion; but, Mr. Stewart, Aunt Daisy is only a woman, not even a very wise one. Having said this, I will run away." Which she did.

In truth, Myrrha was getting tired of Redcombe Cottage.

"If he's going to marry Aunt Daisy, I wish he'd do it. If he isn't going to marry Aunt Daisy, why then I wish to make him sure and certain that he isn't. I don't want to be worried. I like Mr. Stewart, and don't I like Redcombe Manor House! I believe I could get fond of Mr. Stewart, and I know I could get fond of Redcombe Manor! If I could get them, I should be glad; but I don't want to be kept shilly-shallying: to be made to feel worried, and to waste my time. I shall soon be twenty—after twenty a girl like me often begins to go off and to look sickly, and to get too thin. I'm sure I don't want to take him from Aunt Daisy, if she means to have him; but, if she doesn't, I don't see why she should play dog-in-the-manger."

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

V.

HOW HE PASSES HIS DAY.

OUR Egyptian gentleman is ever an early riser, and his morning toilet takes but little time. His bath and his change of linen, with us the first duties of the day, are deferred by him to a later hour.

In that fiery climate the first hours of morn are devoted, by those who have leisure, to a gallop over the desert, just out of the gate of Bab el Nasr (the Gate of Victory). Rising with the dawn, and making but hasty and partial ablutions, and slipping into his baggy breeches and loose linen jacket, our Egyptian takes his whip of hippopotamus-hide in his hand, and, in his yellow morocco boots of soft wrinkled leather, shuffles down-stairs. Kicking off at the door the outer slippers of red-morocco with peaked toes, which he wears in-doors, he passes his threshold, leaning on the arm of his favorite slave—ever at hand, as Byron truly says—

"To guide his steps, or guard his rest,"

and his apathetic face lights up as his eye falls on his Arab steed, fully caparisoned, and held with difficulty by two Nubian or Berberi "syces," the grooms *par excellence* of Egypt. To him the desert-born is led, championing the bit, plunging and rearing, and shaking wildly his silky mane, as though he snuffed from afar and was anxious to seek his native air beyond the pent-in city.

A moment more and the master vaults into the Turkish saddle, with its deep seat and velvet gold-embroidered housings, and stirrups like shovels, capable of goring cruelly the sides of the steed, and apt so to do with an unpractised rider. In that seat the Turk or the Egyptian gentleman looks truly at home, and appears to more advantage than while slouching or shuffling along in a costume not adapted for walking, but very graceful for riding, as well as very comfortable. A small *fangan* of Mocha coffee, black and bitter, with a crust of bread, before he starts, is all he takes to stay his appetite, postponing breakfast until his return. The steed, who literally "knows his master," ceases his playful pranks the moment he feels the pressure of his hand upon the bit, and moves off in that quick, swinging walk in which the Arab horse excels, for the narrow streets of Cairo are too crowded by the early-risen poor of the great city to admit of any more rapid progress through them.

With a rare instinct, which has been educated out of our horses, the steed, with arched neck and pointed ears, moving his deer-like

head from side to side, and, using his eyes as a man would do, daintily picks his way, avoiding obstacles, and carefully stepping over the slumbering dogs that encumber the path. The rider has no trouble in guiding him, your pure-blooded Arab horse does not need it. At length horse and rider pass under the Bab el Nasr into the open country, and, tossing up his head with a wild neigh as he snuffs the desert air, the steed quickens his pace into a gallop. But not without attendants; for, as he starts off, slinking from behind small hillocks, where they have been growling and gorging over the refuse of the city, a troop of lean, savage, wolfish-looking wild dogs, without home or master, start off yelping in pursuit of man and horse. Very dangerous these packs often are, and it sometimes requires both the heels of the horse and the cruel whip of the rider to keep them off. Free of these unwelcome attendants, horse and man press on past the grand old Saracenic structures on the edge of the desert, known as the tombs of the Mameluke sultans—the finest specimens extant of that architecture—majestic in ruin, but rapidly crumbling to decay. On these the eyes of our Egyptian rest with no greater interest than do those of his horse. The eyes of both dilate as, rounding the last of these palaces, the desert—broad and seemingly illimitable, stretching out like an earthy sea to the far horizon, with no tree or shrub or blade of grass to gladden its arid waves of sand—spreads out before, beneath, and around them. The steed breaks into a wild gallop, the man straightens himself in the saddle, and then, bending forward with a wild cry, shakes the reins, and presses the sharp corner of his shovel stirrups into the willing charger's sides. Off, like an arrow from the bow, the charger speeds, passing like the wind the early Bedouin ambling along on his dromedary, or the patient caravan of camels plodding its weary way to Suez.

This is the morning dram of horse and rider, and, after an hour's wild chase after the desert wind, horse and rider quietly thread their way back through the crowded streets, just as the shops in the Mooske are being opened, and the sun begins to assert his power.

The steed is stabled, after having been walked up and down by the careful groom for an hour at least, to cool off before the saddle is removed. The man goes in to a light breakfast of coffee and fruits, and an hour later takes his bath, one of the serious duties of the day, changes his linen and outer garments, and is then ready for business, should he have any, or, if not, he lounges into some coffee-house on the shady Ezbekieh to gossip with friends as idle as himself, and, with much smoking and coffee-sipping, whiles away the slow hours of the long summer day.

At mid-day he returns home to take the inevitable noonday sleep on his divan from twelve till two o'clock; and so universal is this habit, that even the foreign bankers, as well as the native merchants, close their offices, and indulge in it during those hours of sultry noon-tide, even in the winter season, which, however, is as warm as our spring. Awakening from this nap, the Egyptian calls for his pipes and coffee, and, gazing languidly out of his window, which usually commands a view of green gardens and bubbling fountains, patiently awaits the hour of dinner. As he never reads—has no morning or evening papers to give him the sensation of the hour, or the rise and fall of empires or of stocks, and no new publications, or old ones either, to pore over, as his family occupy apartments in a separate part of the house, and day-visitors are unfrequent—one would suppose his time would hang heavy on his hands. But it does not seem to do so. The Egyptian or Turk is never bored—that is one of the plagues of civilization. The placid enjoyment of his animal existence fills him with a steady, serene satisfaction, and there is nothing he enjoys so much as this "taking his keff," the *dolce far niente* of the Italian, only a more absolute negation of any positive sensations, where body and brain both seem, not to slumber, but to be steeped in a soothing repose, which any active movement would disturb—in short, a kind of spiritual opium-eating.

The summons to dinner rouses him from this dreamy state into wakeful interest, for your Oriental, loving all the pleasures of sense, heartily enjoys good eating. The dinner we have described in a former number. After it are taken more pipes and coffee, more keff, another but shorter nap, another and more stately ride past the Ezbekieh and through the city just before twilight, with possibly a visit to a friend in passing, when more pipes and coffee are consumed, and very sparse conversation, and again our Egyptian is at home. The evening he devotes to his harem, not having seen his family all day, as he generally dines in his own side of the house alone, or with some

of his friends. If a domestic man in his habits, he takes supper and passes the evening with his wife and children, having the exclusive enjoyment of their society, since social visiting between the different sexes (as is well known) is contrary to Mussulman usages, and even rarely permitted among the native Christians. Thus a society of all men on one side of the house, and of all women on the other, is all that is to be had in the way of evening parties in the East, and the agreeable mingling of the two elements which constitute society with us, is unknown there. The Roving American is inclined to think that the evenings at home in the harem are rather dull, judging from the hints let fall by his Eastern friends, who, however communicative on other topics, shut up like oysters on any reference being made to this forbidden and delicate topic.

The lower classes enjoy open-air entertainments of jugglers and story-tellers, men and women squatting together under the trees. But rank in the East, as elsewhere, has its penalties as well as its privileges, and the higher classes at Cairo have to shut themselves up at home and do much smoking and sleeping. They retire at an early hour, nine o'clock being the common bedtime. Each wife has her own separate suite of apartments for herself and her family, for the Kilkenny cats would be harmonious compared to a collection of jealous wives in a common apartment, and the partiality or preference of the master of the house is judged of by the frequency of his visits to one wife or the other.

The Egyptian is a model son, husband, and father, especially the first and the last. As to the second, Cairene spouses, who have had the opportunity of conveying their ideas to foreigners, suggest doubts. The unlimited facility afforded to husbands in locking up and secretly making way with their spouses, and the privilege of supplementing the angry dame at home with three others legally, and as many others illegally, as he may choose to purchase—by custom, which is stronger than law—would seem to the inexperienced observer to make matrimony in the East more of a lottery than it proverbially is elsewhere.

SERVANT-SEEKING.

MY wife is a delicate little woman. She was esteemed a great beauty when I married her. Her mother told me that, if I would preserve the roses in her cheeks, I must be very tender of her, and shield her from too much care. For that reason I have always advocated the dismissal of servants who were not absolutely perfect. One morning, last week, Jane omitted to put the large spoons on the table, and the cruets were entirely empty. I took the matter in hand, as a good, kind, considerate, thoughtful husband should, and spoke sharply to the girl. She undertook to answer me back, and I sent her straight out of the house.

"That is the way to do it," I said. "If one girl doesn't suit, try another."

"But, my dear, Jane was a good servant in most respects."

"That is what you say of them all. I tell you, and have told you repeatedly, that it is just as easy to get those who are right altogether. You are too gentle a mistress, and your servants impose upon you. If I had the charge of the house, they would have to toe the mark. I am tired of seeing you so overshadowed with household affairs. Even now there are wrinkles settling in your forehead, as if you were forty-five instead of twenty-seven."

"Ah! the wrinkles date far back of Jane's forgetfulness. I am not sure but they have been produced by the frequency of my visits to intelligence-offices. I thought, the last time I went to one, that my hair would turn white before I got away."

"Why don't you follow up some of those girls who advertise in the *Herald*? My mother used to, and was very successful."

"I have, a score of times. I got Delia from an advertisement—the one who sat down on the baby, thinking he was the rag-bag—and Alice, who stole all my best towels, and Julia, who would take her beaux into the parlor every time we were out in the evening, and I don't know how many more. I have come to the conclusion that, when a servant is neat and honest, it is best to overlook trifling shortcomings. If my husband was just a little more patient, I think I could manage very well. I am worn out with servant-hunting."

"Servant-hunting! I should think it would be a pleasure. I can't imagine any thing so very dreadful about it."

"Suppose you try it? I really do not feel well enough to make the effort; I had rather do my own work for a month."

My wife did not usually speak with so much earnestness, and it surprised me. Besides, she looked pale, and, as I said before, I am a model of husbands.

It was a pleasant morning. I had enough to do; but then I might as well be hindered a half an hour to oblige my wife as to waste so much time smoking after lunch.

"I will, darling. Lie down and rest yourself, or read the papers. Take no more thought about the matter; and now, good-morning."

I kissed her, and went on my way. I bought a *Herald* at a stand on the corner. Glancing at the list of "Situations wanted," I smiled at the absurd idea of putting up with incompetent servants when such an army was in the field. I selected two numbers, which I thought would suit. They each contained three figures, and, of course, were some distance away across the avenues. It was not an inviting-looking neighborhood, and the building into which I entered was far from prepossessing. I knocked at the first door on the first floor. A fat, red-faced woman left the wash-tub, and opened it.

"Did a girl advertise from here for a place this morning?"

"Not as I knows on. Maybe it is in the back room."

I knocked at the next door. It was opened by a little girl of nine or ten, barefooted and ragged, and her mouth full of baked potato. Four other children, of various sizes, came running to look at me.

"Is your mother in?" I inquired.

"No."

"Is there a girl here who wants a place?"

"No."

"Do you know whether there is one in the building?"

"No."

"Maybe it is up-stairs!" screamed an old crone from a bed in the corner of the room, as I took out the *Herald* to see if I had not mistaken the number.

I ascended a narrow staircase, and passed along a dark, gloomy corridor. I knocked at a door, and repeated my inquiries to a yellow, sickly-looking woman, with a babe in her arms. She knew nothing of any such advertisement, but it might be in the next room. At the next room they thought that perhaps it was up-stairs. So I was handed along from one to another until I reached the fifth floor. There I gained the extraordinary information that it was probably in the back yard. Reaching the ground-floor in safety, I proceeded to the rear, where there was a three-story house on the same lot, with a space of only about ten feet between. An old man sat on the pavement, smoking.

"How many families are there in the building?" I asked.

He cogitated a moment or two before he replied:

"Twelve, sir."

It was true! The hall ran through the centre of the building, making four rooms on each floor, and each room contained a family. One man, a shoemaker, had a wife and seven children. I visited every room before I found the one the girl had advertised from. It was the most respectable-looking one of the lot, and the occupant was a young, tidy, well-dressed woman. My spirits rose like foam, and went down as quickly. The girl herself had not come yet. She lived over in Brooklyn.

I wheeled very abruptly, and hurried to the sidewalk. Ugly words rose to my lips, but I did not speak them. I wondered if Effie had ever visited such an abode. Taking out the *Herald* again, I read:

"No. 333 West — Street—a young girl who understands her business, and is neat and obliging."

It was only two blocks off. This time I was fortunate enough to hit the right room at the first knock. The girl herself opened the door. Her manner was a little forbidding. I fancy she belonged to the snapping-turtle order. Nothing daunted, however, I explained my business.

"How many be's there in your family, sir?" she asked, as she surveyed me from head to foot. I dress well, as a general rule; but it was a windy day, and I was in a part of the city where the streets were not watered. Consequently, the damsel before me could not make up her mind on the instant whether I would answer for a master or not. I gave her the number she would be expected to serve.

"Do there be a carpet on the girl's room?"

"Yes. Now please inform me if you know how to take care of

the whole upper part of the house and dining-room, and will do it well."

"Do there be any fires to make?"

"One or two, I think."

"I guess the place wouldn't suit me. I never makes fires. Boys always does them where I lives."

I was again afloat. I didn't fold and put my newspaper in my pocket any more. I read as I walked. According to my printed information, the most desirable person for me to visit was "a smart, capable, willing girl," in the neighborhood of Second Avenue. Quite a stretch from the west part of the city, but I went. It was a fire-story tenement-house again. I gave a dirty boy a quarter to run up stairs and make inquiries for me, and he never came back to report. Near the third landing I found the maiden. She was staying with a "friend," in a little room twelve by fourteen. The "friend" was a dealer in old clothes, and was just sorting over a cargo. The smart, capable, willing girl had seen fully sixty-five summers, and her hair was as white as snow. She was sitting with her feet in a pail of water, trying to cure corns, so she said. I left.

I was getting slightly out of temper when I reached the sidewalk. A dog, harnessed into a small cart, obstructed the way. I raised my foot and removed the whole establishment into the street. After that I felt better. Turning for comfort again to the *Herald*, I found "situations wanted" by several in that immediate vicinity; and I rendered unto all the light of my countenance. One girl had just "engaged." Another did not like to go where they did not keep a "full set of help." A third seemed qualified for our purpose, but her cousin was dead, and she couldn't come for a week. The fourth didn't like our location. The fifth made very pointed inquiries about the number of girls we had had during the last year, and then declined engaging "where they changed help so often." The sixth didn't ever "negoshumate" with a gentleman; "the madame must come hussell." The seventh wanted too many privileges, and had lost her front teeth. The eighth asked my name and place of business, but, never having heard of me before, very dryly remarked that "she only lived with the first families." The ninth was a fair-haired, blue-eyed German, who was not only willing, but exceedingly anxious to undertake any thing. She promised to go to my wife in the course of half an hour; and I, thoroughly disgusted with this world, and particularly with the portion of it which I had just explored, looked at my watch, and found it was two o'clock P. M.

When I reached home, at the usual dinner-hour, Effie met me, smiling.

"Did the new girl come?" I inquired.

"No, I haven't seen any."

I did not give vent to my pent-up emotions. I only played the sympathizing husband, and, somewhat crestfallen, started on another tour of the same nature the next morning.

Without confessing it to Effie, I determined to save time and steps and try the intelligence-office. A polite clerk at the entrance stopped me and registered my name, then I passed into the main room. A clerk sitting by a table numbered me and gave me a card. I was to take a seat correspondingly numbered. The room was filled with ladies talking to servants, and all sorts of persons hurrying hither and thither. A clerk spoke through a tube and called for a chambermaid and waitress for number twelve. In the course of ten minutes a tall, greasy-looking Irish girl came toward me.

"If you are sent to speak to me," I said, "go back and tell them you won't suit. Let another come as quickly as possible."

Instead of obeying, she dropped into the chair near by.

"Won't suit, eh? What ails me?"

"You are not neatly clad."

"Oh, that stuff on my dress is nothing; it will come out with a little sponging—"

I stalked across the room, and advised the young man in attendance to send a decent girl to me in short order. I conferred with six before I gave my address and sent one to my wife. The little performance occupied an hour and a half, and my office-work crowded me the rest of the day. I dined down-town. Having lost my key, I rung the bell of my own door about half-past nine. The discarded Jane admitted me.

"Effie, how is this?" I asked, before taking a chair.

"Oh, nothing extraordinary. The girl you sent, came. She seemed perfectly satisfied with the place, but, in the course of an hour, we heard the lower door slam, and saw her running down the street."

Toward evening Jane came for her money, and, not having enough by me, I detained her until you should come in. She went to work of her own accord, has put the house in order, and assisted me in every way possible."

"Keep her, if she will stay. I will promise never to complain of any thing hereafter short of hair-pins in the gravy. A dishcloth or two in the pudding will be a trifling grievance compared with what I have been through during the last six-and-thirty hours. And, Effie, say to your lady-friends that, if their husbands are too exacting in little things, and meddle in domestic matters where it would be more sensible for them to mind their own business, you know of a remedy."

I have always been a model; I am now one of the most docile of husbands. And it pays. Effie looks five years younger, and the servants no longer creep round the house in constant fear of my making discoveries to their disadvantage. A few words of well-timed commendation have cured Jane of her chief fault, and, since I have seriously thought about it, I believe her to be a most excellent servant.

M. J. LAMB.

A COMEDY AT FORLÌ.

THE ancient and romantic little city of Forlì, which lies at the foot of the Apennines, about forty miles from Bologna, is rather off the beaten road of travel, and has more of the mediæval flavor than any Italian town I have visited. Its population is not above sixteen or seventeen thousand; but it is full of associations, and impressed me more than Ferrara or Fienza, Mantua or Rimini, with all their mouldy memories of the past. It has its theatre and opera, as may be supposed, though neither the one nor the other is of a very high order. Still, I liked to go there, and to make up what the music lacked by pondering on what it suggests in regard to the historic past.

I was sitting one night in the pit, when a gentleman at my side entered into conversation with me, and I discovered that he was an American, the first I had met there. At the close of the performance we began to criticise it, when he remarked that he had witnessed a most extraordinary entertainment on that very stage, which had taken him altogether by surprise.

"Indeed," he continued, "I shall not forget it if I live a hundred years. Its impression will never be removed."

"That is very singular," I said. "I can't imagine how any very remarkable performance can be given in so small a city as this. The music must always be inferior where the patronage is so slight. Be kind enough to tell me what there was extraordinary in the representation of which you speak."

"Well, here we are at the Albergo. Let us go in and order a bottle of Lachrymæ Christi, and I'll tell you all about it.

"It was late in the autumn, seven or eight years ago. I was on my way from Bologna to Rimini, and concluded to stay here overnight, as I had never seen Forlì before. In the evening, as I was wandering around, I passed the theatre, and, observing that Bellini's 'Capuletti e Montecchi' was to be given, I went in. It was a little after the hour; but I found the opera not yet begun. Though the house was tolerably full, I had no difficulty in getting a seat. I waited patiently for fifteen minutes, and still no signs that any of the Capulets or Montagues had as yet been born. I did not wonder that the audience displayed some vexation and disappointment in cries of 'Basta! basta!' I sat for ten minutes longer. The house was growing somewhat uproarious, and I was on the point of going out when the stage-bell rang for the orchestra, and the instrumentalists began the sad and tender overture. That done, the long-delayed curtain rose, but on quite a different scene from that recorded in the *libretto*.

"Instead of the members of the rival houses, testy and turbulent, some twenty men, in the picturesque costume of the Abruzzi, appeared drawn up across the stage with guns levelled at the audience. One of their number, who seemed to be their chief, stepped to the foot-lights, and informed the people in front, in very un-Tuscan Italian, that they would be instantly shot if they made the least resistance.

"It occurred to me that this was quite a new version of an opera I had supposed myself entirely familiar with, and, in all my recollection of the lyric *répertoire*, I could not think of any drama which began exactly in that way.

"The audience was evidently dissatisfied with the first scene, and many of them, in spite of the menace and the levelled guns, started pell-mell out of the house. A number of the ladies screamed and jumped up in the boxes; but, in a few minutes, they became calm and quiet, and showed more coolness and self-discipline than their natural protectors.

"For myself, though I did not particularly relish the situation, I felt more amused than alarmed at its unexpected novelty, and I waited to see what would happen next. I noticed that the men who had attempted to quit the theatre had returned paler than when they sought to go out, and I overheard one of them say, 'The doors are all guarded by armed men, and we shall certainly be murdered, every one of us!' This was comforting at least, and I remembered with a kind of melancholy satisfaction that, as I had no creditors, I should leave no one to mourn for me, if the worst came to the worst.

"Fill your glass, my friend. Let me assure you that in this world no man is missed unless he leave debts behind him. Therefore, always owe somebody something if you wish to be remembered.

"The next thing in the programme was the entrance into the theatre of ten or twelve more of the black-bearded, peak-hatted, amateur or professional artists, who looked as if they would cut a throat for ten *baiochi*, and that the rate would be reduced if murders were required by the dozen. The new-comers, gun in hand and stiletto in belt, went to everybody in the house, and used such persuasive speech as to induce them to part with their valuables. They transacted business more rapidly and efficiently than I had ever known it to be transacted in Italy.

"In less than a minute, a fellow, who might have been poisoner and assassin-in-chief to the Borgias, stepped up to me, and, lifting his hat, said:

"'Buona sera, signore; scusàtemi;' and held out his hand for my personal property.

"I had prepared for him by concealing my watch and purse in an inside pocket. I presented two or three bank-notes received some time before in Palermo and not current anywhere, with an I. O. U. taken from an impostor in Paris, and worth ten per cent. less than nothing. Determined not to be outdone in politeness, I remarked, as I handed him the precious treasure:

"'Siete molto cortese.'

"He took what I offered without question, and, saying 'Cosi, va bene; grazie, signore,' turned his rapacious attention to my neighbor.

"Very soon the robbery was complete, and the thieves quitted the theatre, while the leader of the band (I don't mean the director of the orchestra) ordered the strangers on the stage to recover and shoulder arms, which they did, and marched off without a word.

"As soon as the bandits had gone, such a chattering, and swearing, and general tumult, arose among the audience, who then felt free to express their feelings at the outrage, that I could not help laughing. While this confusion was at its height, the manager appeared before the foot-lights and made an explanation of what had taken place.

"He said that, just as the performance was about to begin, a band of brigands had descended from the Apennines, surrounded the theatre, taken possession of all the entrances, bound the artists and everybody behind the scenes, and then proceeded to plunder the audience in the manner I have described. He thought there were about one hundred of them in all, and expressed the hope that the infernal scoundrels would yet be captured and shot—a sentiment which awoke general sympathy and hearty applause, but not an atom of expectation. He added, moreover, that he was very sorry for the unpleasant but unavoidable occurrence; that he was willing to refund the money we had paid for admission, and would be only too happy if the bandits would also make restitution. If we cared, however, to hear the opera, he would be charmed to present it, and so, bowing, he retired, amid loud bravos and clapping of hands.

"Nobody quitted the theatre; and, as I fancied some other novelty might be offered, my curiosity impelled me to remain.

"Bellini's composition was very fairly rendered. The artists and audience were in unusually good spirits after the peculiar *contre-temps*, and were on the best terms with each other.

"I felt some desire to know whether this sort of thing happened often or only occasionally, and on inquiry I was told it was altogether unprecedented. I was glad of this, for I like novelties, even when they are somewhat disagreeable, and I consider that episode worth twice the price of admission. In fact, this cool and ingenious method

of robbing a whole audience pleased me so much that, whenever I am in this part of the country, I visit Forlì in hope of seeing it again.

"I have known a great many changes of programme during an opera-season, but that was the first and last time I ever knew 'Fra Diavolo' substituted literally for the 'Capuletti e Montecchi' on any stage. I like Bellini; but I prefer bandits. Cameriere, cavate il tappo a quella bottiglia."

JUNIUS HENRI BROWNE.

A GREAT SECRET.

MY friend, here's a secret
By which you may thrive:
I am fifty years old,
And my wife's forty-five—

A queen among beauties,
The wedding-guests said,
When we went to the church
With the priest, and were wed.

That's thirty long years past;
And I can avow,
She was no more a beauty
To me, then, than now!

For never the scath of a
Petulant frown
Has ploughed with its furrows
Her young roses down.

And still, like a girl, when
Her praises I speak,
Her heart fairly blushes
Itself through her cheek.

Her smile is more tender
For being less bright;
And the little bit powder
That makes her hair white,

And all the soft patience
That shows through her face,
In my eyes, are only
Like grace upon grace.

For still we are lovers,
As I am alive,
Though I, sir, am fifty,
And she's forty-five!

And here's half the secret
I meant to unfold,
She don't know, my friend,
Not the least, how to scold!

Nor does she get pettish,
And sulk to a pout,
So, since we fell in love,
We never fell out!

And here's the full secret
That saves us from strife:
I kept her a sweetheart,
In making her wife!

And if you but wed on
My pattern, you'll thrive,
For I, sir, am fifty,
My wife, forty-five!

ALICE CARY.

GEORGE HENRY LEWES.

THE past quarter of a century has witnessed the rise, in England, of a remarkable number of bold, radical, philosophical thinkers and writers. Almost every corner of the broad domains of science seems to have been invaded by vigorous and adventurous spirits, who have stoutly resisted taking any thing either for granted or from "authority;" have insisted on judging and knowing for themselves; and, while availing themselves of the lore of previous philosophers, have only lingered in their paths while they were lighted by what they themselves saw clearly. Conservatives have shuddered over the profanations of the august temples of ancient learning; men of piety have mourned the dethronement of Christian philosophers; politicians of the old school have wept, like Eldon, as they saw the vestiges of the ancient constitution one by one passing away. Theological, political, and social science have been no more secure than natural and exact science. All have been submitted to crucial tests on the part of operators who defied tradition when tradition assumed to close their eyes and impose silent obedience, and only respected tradition when tradition served them as guide-posts. The names of such men as Mill, Huxley, Tyndall, Faraday, Herbert Spencer, Congreve, Proctor, Colenso, Cobden—names famous each in its sphere—serve to stamp the era as one of bold investigations which startle, while they compel admiration from timid and groove-bound minds.

Perhaps the greatest immediate influence, impelling the thoughtful to this *frondeur* manner of grappling with philosophical problems, in England, has been that exerted by John Stuart Mill. But another, with many as potent, with some more potent influence, has been somewhat quietly but very deeply drawing to the same end, inspiring intellectual courage and breeding knights-errant of science—the influence of Auguste Comte. The Positivist is no longer to be ignored, much less despised. Of Comte's scientific theories, Mill himself is a disciple, and the *Westminster Review* has at least been a candid and elaborate expounder. Comte's religious philosophy is another thing; and those who study Nature according to Comte are by no means necessarily devotees of the sect which he has founded. Mill, who had no language too praiseful of the first, found none too bitter for the last.

There was something in the Positivism of Comte, and in its elucidations by Mill, peculiarly attractive to a set of cultivated and independently thinking young men who formed the nucleus, later, of a bold school of writers, whose productions have not ceased to startle the English intellectual world. The fundamental doctrine of the Comtist philosophy may—since it is of an eminent Comtist that we propose to write—be briefly stated. It is, that we have no knowledge of any thing but phenomena; and our knowledge of phenomena is relative, not absolute. We know neither the essence nor the real mode of production of any fact, but only its relation to other facts in the way of succession or of similitude. These relations are constant; that is, always the same in the same circumstances. The constant similitudes which conjoin phenomena, and the constant sequences which unite them as antecedent and consequent, are called their *laws*. And these laws are all we know about them. Their essential nature, and their ultimate causes, whether efficient or final, are unknown and inscrutable to men. Upon this doctrine all the scientific philosophy of Comte rests, and upon it he built an imposing structure, such as, whatever our beliefs may be, entitle him to be ranked with Descartes and Galileo, among searchers into the mysteries of Nature.

Among the foremost of those who adopted the leading ideas of this Positivism was GEORGE HENRY LEWES, who, during his editorship of the *Fortnightly Review*, contributed himself and admitted many other contributors to its pages, in defence of the great Frenchman's system. Professor Lewes is now known as one of the profoundest students in philosophical lore, ancient, mediæval, and modern, English and foreign, in his country. Long-continued ill health has abridged the number of his contributions to science; but those which he has been able to produce illustrate the wealth of a learning which has been long and patiently acquired. His attainments are mainly in the direction which has been stated; but he has proved himself skilled in the lighter and more graceful departments of literature. He has made an especial study of German and the great German writers, pursuing his studies among the profounder works of Scaliger, Eras-

mus, Kant, Schlegel, and Goethe. From early youth his predilections were for the profession of letters, uncertain and few as are the inducements to follow exclusively such a career.

He was born in London, in 1817, and received an education partly on the Continent, and partly under the tuition of Dr. Burney, at Greenwich. Like many literary men before and after him, he tried and soon wearied of a commercial training, returning eagerly to his books, and thenceforth stoutly sticking to them. At first, as the part of a general plan of philosophical study, he delved into anatomy and physiology.

Having acquired the elementary principles of these sciences, he went to Germany to extend the range of his studies. He was in that country during his twenty-first and twenty-second years, mastered the language, participated in the riches of its literature, and became deeply impressed with the works of its philosophers. Returning to London, he settled down as a student and man of letters, assiduously adhering to the line of investigation begun in Germany, and writing now and then for the papers and periodicals.

The first elaborate work by which he became known as an author—one which entitled him to no mean place among philosophical scholars, was "A Biographical History of Philosophy," in two series of two volumes each, the first series treating of ancient philosophy. In this work we have finished critical essays of the Greek sages, more especially of Socrates and Plato, as well as biographies.

Of Plato we learn much that is of the deepest interest. Mr. Lewes apprizes us that Plato has scarcely any imagery; and, though the Edinburgh reviewers dissented from this dictum, they admitted the truth of Mr. Lewes's description of Plato's illustrations as "for the most part homely and familiar." He called attention to Aristotle's estimate of Plato's style as capital—that it was a middle species of diction between prose and verse. There are indeed in Plato's works—and no one more readily recognizes them than Mr. Lewes—passages of diverse and singular beauty. But he points out that the Platonic system was not a mere poetic conception, but a great problem calmly and logically worked out. "Plato," he says, "never sacrifices logic to poetry. If he sometimes calls poetry to his aid, it is only to express by it those ideas which logic cannot grasp, ideas which are beyond demonstration; but he never indulges in mere fancies."

GEORGE HENRY LEWES.

It may be said that this view of Plato's methods of composition quite harmonizes with our conception of Plato's character. It was not severe; it was calm, judicial, excessive neither in intellectual hair-splitting nor in exuberant rhetoric. Plato often, as Mr. Lewes says, sacrificed the general effect to his scrupulous dialectics, and his incessant repetitions were designed to deeply impress on the reader's mind the real force of his method. Appended to Mr. Lewes's second volume of this series we find a very spirited translation of some of the more important scenes of the *Gorgias*; and the work as a whole seems to have received a hearty welcome from the English classicists, though some of them earnestly protested against many of the author's criticisms. It was published in 1847, when Mr. Lewes was in his thirtieth year; and soon after he illustrated the versatility of his mind by publishing a story called "Ranthorpe," which had good success. During the ensuing ten or twelve years his pen was very active. In 1848 appeared a novel called "Rose, Blanche, and Violet," and a study of the Spanish dramatists Lope de Vega and Calderon; in 1850 his "Life of Robespierre," a remarkable work, in which the dictator of the Terror was put before our eyes in a new light in many respects; and this year he also assayed his ability in dramatic writing, producing a tragedy—"The Noble Heart"—full of literary excellences but quite unsuited to the demands of the modern stage. He next devoted himself to a careful treatise on "Comte's Philosophy of the Sciences," in which we find many of his philosophical

views modified, and perceive that he had advanced—if the expression is right—from a metaphysical to a "Positivist" method of thought.

The work by which he is best known to general readers, and which doubtless gained him his fame in America, is his "Life and Works of Goethe"—much the best biography of the great German extant in our language. He was well qualified by his culture and predilections for German studies to engage in this undertaking, and this book is already a standard one in its department of literature.

"Seaside Studies," and the "Physiology of Common Life," the latter very popular, and full of the writer's graceful vivacity of style, were published in the same year, 1860; and in 1861 appeared another of his minute studies of the Greek philosophers, in "Aristotle; a Chapter from the History of Science." The commendations which this book called forth might well gratify so ambitious and zealous a

scholar. It was written with great vigor and independence of mind, as well as with a clearness of expression which had become a characteristic of Mr. Lewes's productions. It was, however, designed as only the introductory part to a much more comprehensive scheme which he had long projected, and has since, owing to ill health, unfortunately been compelled in a great measure to postpone; and was especially devoted to an exposition of "the origin and development of science—the embryology of science, so to speak."

The claims of Aristotle as a natural philosopher are discussed in the first volume, and a careful and succinct analysis of his physical treatise is made. There are few more interesting passages in modern scientific literature than Mr. Lewes's chapter on "The Anticipation of Modern Discoveries." We learn (with an even higher respect for Aristotle than we had before) that the old Greek had an acquaintance, more or less familiar, with some five hundred various species of animals—a wonderful thing when it is considered that Aristotle lived in the fourth century before Christ, and was actually the earliest of known writers on natural history. Mr. Lewes shows us, however, that Aristotle's practical knowledge of zoology was very limited. The traces of philosophical positivism are very clear throughout this book.

The light in which Lewes studied Aristotle, as every other man or work of science, ancient or modern, is discovered to us in many of the passages in the work on Comte; and we can do no better in defining the position of the author, who is, above all, distinguished as a follower of Comte, than to note briefly some of the ideas. According to Mr. Lewes, there are three distinct and characteristic stages which history reveals in man's attempts to explain natural phenomena. They have been named the supernatural, the metaphysical, and the *positive* stages. In the supernatural stage man explains phenomena by some "fanciful suggestion" suggested by the analogies of his own consciousness.

"Nature," says Mr. Lewes, "is regarded as the theatre whereon the arbitrary wills and momentary caprices of superior powers play their varying and variable parts. Men are startled at unusual occurrences, and explain them by fanciful conceptions. A solar eclipse is understood, and unerringly predicted to a moment, by positive science; but in the supernatural epoch it was believed that some dragon had swallowed the sun!" In the metaphysical stage, man explains phenomena by some *a priori* conception of inherent or superadded entities suggested by the *constancy* observable in phenomena, which constantly leaves him to suspect that they are not produced by any intervention on the part of an external being, but are owing to the *nature* of the things themselves. "The notion of capricious divinities is replaced by that of abstract entities, whose modes of action are, however, invariable, and in this recognition of *invariableness* lies the germ of science. In this epoch Nature 'abhors a vacuum;' organized beings have a 'vital principle;' matter has a *vis inertiae*." When we reach the stage of positivism, the stage illustrated by Comte, man explains phenomena by adhering solely to those constancies of succession and coexistence ascertained inductively, and recognized as the law of Nature, and in this stage the invariableness of phenomena under similar conditions is recognized as the sum total of human investigation; beyond the laws which regulate phenomena it is idle to penetrate. Mr. Lewes shows us, in his "Aristotle," that Grecian philosophy belonged to the metaphysical stage. The progress, according to him, has been gradual from this to the positive stage; the step from the one to the other beginning from Francis Bacon, the father of inductive science.

Enough has been quoted from Mr. Lewes, even in this brief sketch, to show that his style is perspicuous, bold, lively, not wanting in a polished grace, energetic, and far from dry. He seems to adapt himself well to the ordinary understanding, and he has certainly a right to be ranked among that most valuable class of scientific writers who within twenty years have done so much to make science *popular* by interpreting it so that it may be easily and generally comprehended. No one can rise from a perusal of the "Biography" and the "Aristotle" without a clear idea of the systems of the great thinkers of Greece; and while the dissentients from Lewes's Comtist doctrines will far outnumber those who yield to them, their discussion cannot but shed light upon the gravest problems which mysterious Nature everlight presents for the human brain to ponder.

Mr. Lewes partially followed out the general plan to which I have alluded, by publishing, in 1867, "The History of Philosophy from

Thales to Comte;" which comprises a sort of generalization and maturing of the ideas presented in the previous works, as well as giving the reader a broad survey of the progress and tendencies of the philosophies which from time to time prevailed in the learned world. Meanwhile he contributed to the *Edinburgh and Westminster*, to *Blackwood*, *Fraser*, and the *Cornhill*. He edited the *Leader* from its foundation in 1849 till 1854. In 1858 he read a paper before the British Association for the Advancement of Science, on "The Spinal Cord as the Centre of Sensation and Volition;" which he supplemented in the following year by some addresses on the "Nervous System," marked for their originality and bold antagonism to commonly-received ideas.

He founded the now famous *Fortnightly Review* in 1865, resigning the editorship, owing to ill health, in 1866, when he was succeeded by John Morley, a young Comtist of rare ability. The *Fortnightly* has always been noted for its independent and radical views. It first published Huxley's remarkable article on "The Physical Basis of Life." Mr. Lewes a few years since married Miss Evans, who stands in the foremost rank of English novelists and poets, under the *nom de plume* of "George Eliot;" and they now reside in a pleasant, umbrageous little nook in St. John's Wood, one of the quietest and prettiest quarters of London. It is surely to be hoped that Mr. Lewes will not be deterred by precarious health from further literary labors; and especially that he may be able to accomplish the lofty scheme which he long ago proposed to himself.

GEORGE M. TOWLE.

ALBRECHT VON GRAEFE.

THE most eminent oculist of this century, or of any century, Dr. ALBRECHT VON GRAEFE, died at Berlin, July 20th, at the age of forty-two. He was born at Berlin, May 22, 1828. His father was for many years the surgeon-general of the Prussian army, which accounts for the infant Albrecht having had such distinguished sponsors at the baptismal font. They were the king and his son Albrecht, the father and brother of the present King of Prussia, the minister of war, Count Hacke, the Countess von Latteem, and Madame von Bredow.

A detailed account of the scientific labors of the deceased would be uninteresting to the general reader; it may not be out of place, however, to state that he effected as complete a revolution in eye-surgery as did Napoleon I. in the art of war. His labors and researches were eminently practical in their character. He strove, above all things, to base our knowledge of eye-diseases upon a thoroughly scientific foundation, and to relieve this important branch of medicine, as far as possible, from empiricism. How well he succeeded, is best known to his pupils, who may be found in all parts of the civilized world. Nearly all the leading oculists in this country have spent more or less time in Berlin, for the purpose of studying the specialty of their choice under the direction of this great master. Many a tearful eye has read the announcement of his early death, that but for his genius would have been in total darkness.

There is a terrible disease of the eye—acute or inflammatory glaucoma—which, if allowed to take its course, usually results in the rapid and total destruction of vision. Until within the last fifteen years this disease was deemed incurable; it was the terror of the physician, for he was ignorant of any means by which he could even retard its progress. The remedies usually efficacious in inflammations seemed more frequently to aggravate than to palliate it.

Graefe delivered humanity from this scourge. He discovered that if, in the first stages of the disease, a certain operation were performed on the eye—the excision of a portion of the iris—the inflammation and intense pain disappeared as if by magic; that vision was completely restored, even in cases where it had decreased to a bare perception of light; and, further, that the patient was insured against a relapse.

To Graefe's most brilliant achievements in the field of operative eye-surgery, may be reckoned the method he adopted, a few years ago, of operating for cataract. This new method, as shown not only by Graefe's experience, but also by that of other operators, renders this important operation very much less to be dreaded than it was formerly.

Of the greatest importance, too, are Graefe's studies of the various

forms of strabismus—squinting—and his improved method of operating for this deformity. The number of strabismus operations performed yearly by him was truly immense—far greater, for example, than the number performed by all the oculists in Vienna.

The major part of Graefe's scientific writings were published in his "Archives of Ophthalmology," which he began to issue in 1854, and comprise fifteen octavo volumes. The student finds in these archives a complete history of modern eye-surgery.

On receiving the news of his death, one of the most distinguished *survants* in Germany wrote:

"I am deeply moved by the melancholy tidings of our Graefe's death. His loss to science is irreparable, for men who, with the cares and responsibilities of an immense practice, find time to originate great ideas, appear only at intervals of centuries."

And Graefe was no less distinguished as a teacher than as a *savant* and practical oculist. As a lecturer, he was wonderfully clear and fluent; indeed, his delivery was, perhaps, too rapid. He spoke only for those who already had a considerable knowledge of eye-surgery; the beginner found it quite impossible to follow him.

To Graefe's intellectual greatness was united every other natural advantage, physical and moral. He was considered as a representative of one of the highest types of manly beauty, his head having been what the Germans call "ein wahrer Christuskopf"—a true Christ's head. The fascination of his manner and the extreme generosity of his nature were proverbial. His pupils and patients idolized him. In his associations with his colleagues, that modesty which so frequently adorns true greatness rendered him irresistible. I shall never forget the amiability of Graefe's manner toward me during the time that I, some years ago, attended his clinic. The scientific discussions in which he occasionally indulged with his pupils, he always conducted with so much modesty and tact, that his opponent quite forgot that he was arguing with the greatest of living masters.

REEMS'S CREEK AND THE OLD MILL.

ONE sultry day in June, a band of seven brothers toiled slowly up the sides of the Black Mountains; brothers they were not in blood, but in a tie that binds thousands throughout the world. The romantic idea had been conceived of celebrating St. John's Day (June 24th) on the summit of Mount Mitchell. Many had claimed the privilege of being of the band, but as they left their horses and all roads at the foot of the mountains, and took to walking in the wild, pathless woods, guided only by the hunter's eye and the compass-needle, only seven names answered to the call. Through thickets of rhododendron, magnificent with crimson flowers; up streams of crystal water, around cascades, rich in artistic beauty, and looking down into caverns far below; sometimes up a ridge almost perpendicular, then through a broad plateau, studded with noble chestnuts; or stopping a moment to look on the far-extended view from one of those queer bald spots the Indians call "Devil's Footprints"—thus they went: in front, that old mountain hunter and surveyor, Bob Blackstock, with his compass swung around his neck; next to him, the Grand Master; the rest trailed one by one behind, till far in the rear the last, who was weak in body, but strong in spirit. Just as the crimson sun was hiding itself behind the smoky tops of the Great Unaka, we touched the edge of the balsam-growth. Stopping at the side of a spring, whose drops, as they tumbled far below and went into spray, seemed, in the dying glow of the setting sun, to be a ruby aurora floating down the valley, faithful Bob threw off his knapsack, unsheathed his axe, and exclaimed:

"Here we rest to-night. This is the head-spring of Reems's Creek, and you are about three thousand feet higher in the world than at Asheville yesterday. Now for a fire, a house, and a bed."

"And a stew for our sick boy," said a voice behind him.

The sharp report of the rifle rang out on the clear mountain air, rolled and echoed far down the valley, and a fat gray squirrel dropped at our feet.

"He's got no business up here anyhow, interfering with the mast that belongs to the poor little chipmucks," added the hunter, as he

laid down his rifle, and forthwith proceeded to divest the animal of his skin.

Sweetly toothsome did it taste that night, for the boy was sore and weary; boy they called him, for of that party he alone stood less than six feet in height.

A great glowing fire was soon sending its smoke far upward, while the valley below and the hills above echoed and reëchoed the popping and crackling of the burning logs. A bed that a king might envy was made from the tender boughs of the balsam, with blankets spread over them. Supper was served, and then came pipes and stories.

"You say, Bob, that this is the head of Reems's Creek," asked the boy.

"Yes, this is the head-spring of Reems's Creek. It empties into the French Broad just above Alexander's. You know THE OLD REEMS'S CREEK MILL, on the right of the road as you go down the river. Well, that old mill is nigh about the oldest building this side the mountains. Old Reems built it there as a sort of fort, something of a store, and little of a mill. The old ford of the French Broad is just at the mouth of the creek. There wasn't many Indians this side the French Broad and Swannanoa, and the trail from the settlements east to Tennessee passed by the old mill, just about where the road does now; it left the river below. Some say that Daniel Boone first learned to shoot Indians and bear at that ford and on this creek. My father and Tom's (the old man was an honest hunter, and never would have killed even a squirrel this time of the year, nor in such a place as this, even for a sick boy)"—Tom was ready with a reply, but the story went on. "As I started to say, Tom's father and mine were the first settlers who left the river and built cabins up any of the creeks. No one would believe, from the looks of the rocky stream where the old mill stands, that a few miles up the stream are some of the prettiest valleys in the world. I showed you the old place to-day, and you never saw better land in your life. I know I never did, and tramped all over Mexico with Taylor and Scott.

"Then the mountain-sides are rich, too. There's old Craggy where the other fork rises; she don't deserve that name, for there's some extra land up there. When old Professor Somebody came to our house for a guide, with a letter from Zeb, I took him up a spur that Brigman had a cornfield on, just about thirty-five hundred feet higher than the sea. It was No. 1, and would run fifty bushels shelled to the acre close. He looked a little wild at it, then out with his instruments and made some calculations. I tell you he opened his eyes wider than a runaway steer. He said it was an astonishing growth and fertility for mountain-land. I didn't say much, for I knew he'd been used to the barren White Mountains, and if he'd seen the Rockies they wern't any better, for I'd tried them. As we came back to Asheville, I took him down through Nick's 'grass' plantation on top of Elk Mountain.* He stared at the tall timothy hard and long enough, but didn't say a word.

"Good land isn't all Reems's Creek has to boast of either. She's some on the men line. There's old Governor Swain, General Joe Lane of Oregon, and Zeb Vance, member of Congress, Governor, or what he is; he's 'Zeb' in Buncombe, and always will be. They were all born and brought up with not much more than a tow shirt to their backs, right down there in that valley you'll see the first thing in the morning. Come, turn in now."

"Not yet," said several. "Which way in the morning?"

"Straight up and on the ridge till we strike the road on the main Black, about half a mile from Otey's cabin."

"All woods?"

"No, we'll strike a bear-trail about three miles from here; and just there I saw a bear do the cutest thing. He couldn't have done better if he'd been a reg'lar educated Yankee."

"Give it to us!" exclaimed two or three.

"Make it short," drawled fat Dickerson.

"Tell the truth, Blackstock," gravely said Grand-Master Robert.

"I knew somebody'd doubt my word, but I'll tell you THE BEAR-STORY.

"I had lost a lot of pigs at a mountain-bed, where I kept an old

* Hon. N. W. Woodfin, of Asheville, by comparing his own soil with that of the North, concluded that he could grow the Northern grasses, and also make cheese at home. He planted timothy and other grass, was gratified with the result, and the last three years have proved his wisdom in the erection and successful working of several cheese-factories; cheese from one of which, sampled in New York, was pronounced equal to any made in the North.

PICTURESQUE AMERICA.—REEMS'S CREEK, NORTH CAROLINA.

sow or two, and I made up my mind I'd have revenge out of some bear, so I took my stand on the mountain near the bear-trail we'll pass to-morrow. It forked not far off. Now a bear, when he's travelling in summer, every now and then stops, rears up side of a balsam, and makes a scratch—his mark. This is especially done at a fork of their trails. Another bear comes along, and can't make his mark as high; he knows the other bear is the largest, so he turns back or takes the other fork. Well, the day I was up there I had waited full four hours, and felt particular wolfish, when there came a despicable little bear, but with an awful knowing look about him. I had a great mind to kill him just for spite, but thought I'd wait till he got to the fork. He stopped and looked carefully at all the trees down one trail. Then the little cuss just turned and rolled a big rock up to the tree that had the most marks, got on it, reared up, and made his mark far above the best of them. He got down, rolled that rock back to its place, and went on his road. From the way he shook all over, I just knew he was laughing hard to himself."

"And you didn't shoot him?"

"Shoot that bear? I'd about as soon shoot my father. Now, sick boy, it's time to go to sleep."

"Stop a minute. Is there any danger from snakes?"

"Nonsense, child! nobody ever heard of a snake on these mountains, where the balsam is the natural growth. Go to sleep, rest easy, and dream of Alexander's pretty daughters at the other end of the creek. I'll throw a maple-leaf into the Branch, with your love; it may get there some day. It's about as likely to as you are to get one of them."

Then, with the soft, rich odor of the balsam coursing through our lungs, the rippling music of the little rill, and the sighing of the trees above singing in our ears, we slipped away to sleep.

H. E. COLTON.

AN INTERVIEW WITH PRIM.

LIKE Lincoln, Prim falls just as his work is done, just as he has guided the state through a great revolution. Both were hated alike by Tories and dreamers; both were upheld by the masses. Like Napoleon in France, Prim had the rare union of judgment and nerve that enabled him to see and to do what each instant needed.

Whether his aims were unselfish depends on definitions. In a land where the army is every thing, he, thirty years ago, saw that the future belonged to liberal views, and cautiously so said. The only general of known progressive feeling, the progressists' hopes centred on him. While that party was down, he spoke and acted with great care, so as to win the love of the troops, keep the party's favor, and retain his rank. When the three liberal parties of Spain came into power, Prim came back from exile at their head, and, during the trying and eventful two years since, has toiled to found freedom of thought and expression firmly in ruined Spain, and at the same time to keep himself in power and fill his purse. All three he has somewhat done; and, having led the establishment of the new order of things, he passes from the stage as the king he has made steps on the soil he has helped to free.

On sailing for Spain from New York, in July, 1869, I received from Alfred H. Love, of Philadelphia, president of the American branch of the Universal Peace Union, credentials as vice-president of the Union, together with a copy of resolutions and committee action against Cuban privateers. In a letter enclosing them he said:

"The latest action please communicate to the Spanish powers, and give us a report of its reception."

At Barcelona, in October, I asked Carlos Fernandez de Castro-verde, Director of Academic Instruction, if Prim would see me, as my mission was unofficial though friendly.

"Yes," said he; "Prim is accessible, especially to Americans, whom he likes; but it may take two or three days to gain admittance. The doo-keeper will probably tell you 'He does not receive to-day, call to-morrow.'"

In Valencia, the bright-eyed boy who drove me from the port to the town in a two-wheeled cart, with round canvas top, crimson curtains fore and aft, and black-leather seats along the sides, told me as we bowled along the stone road past gardens, and vineyards, and fields dotted with stone houses, that Prim was suspected of seeking to bring

back the hated Bourbons in the person of the Duke de Montpensier. This suspicion was at one time wide-spread. He was, on the other hand, charged with republican leanings. Be his faults what they may, he has given a good example to Spanish politicians by being true to his public pledges.

On reaching Madrid, I inquired at my hotel where General Prim could be found, and was told at the Ministerio de la Guerra, or War Department, he being Minister of War and President of the Council of Ministers, or, as we should say, prime-minister. The landlord failed to give more than a vague idea of the direction, so I sallied forth in that which he pointed out, and emerged on a broad street that runs west from the Prado, or Fifth Avenue of Madrid, to the semi-circular Puerta del Sol, or Sun-gate Place, where the City Hall stands.

I walked up to the first gentleman I met, and said, in Spanish:

"Sir, I am an American gentleman, and seek General Prim."

He pointed to a street that ran diagonally across the one wherein we stood toward the Prado. This led into a second broader avenue parallel with the first. After another inquiry I reached the Ministerio, a large square building, of light-gray stone, standing at some height above the street. Passing the scarlet-uniformed sentry at the gate, I walked up a paved path through a large garden, mounted two flights of steps, and reached a high archway, where a sentry paced and a corporal's guard lounged. Beyond appeared a great stone-floored courtyard in the middle of the building; opposite where I stood, another archway gave a glimpse of another street. Turning to the right, a broad flight of marble steps led to the second floor. At the landing idled a second guard. To the right a door stood open, passing through which a second door appeared on the right again. To the left, at a desk, sat a pompous-looking, fat, short man, to whom I spoke, but who did not seem to understand, and pointed to a burly fellow of forbidding look, who stood keeping the inner door (which was covered with green baize), and shut out with a frown every one who sought entrance, except now and then an officer. Finding my Spanish unequal to the occasion, I said to him:

"I am an American gentleman, and would like to see some gentleman who speaks French."

After shrugging his shoulders, frowning, and protesting, he went in, and directly opened the door with an invitation to come in.

The room was large, high, and richly figured with red and gold. Deeply-recessed windows looked out on the garden, and were hung with curtains of crimson velvet. Lounge-chairs and sofas of the same covering were scattered about, and a great battle-piece covered the farther wall. Below it was a desk, about which a group of officers chatted. A little gentleman in civilian's dress, with a cigarette in his mouth, asked me, in French, what I wished.

"I am an American, and have business with General Prim; is it possible to see him?"

"Not to-day; call to-morrow at eleven, and he will receive you."

"Shall I leave my card?"

"Certainly; it will be sent to him."

I wrote on a card: "I am the bearer of a friendly message from the American branch of the Universal Peace Union, and seek an interview to communicate it;" gave it to him, and took leave.

At eleven the next morning I remounted the wide stairs. When I reached the landing the officer gave command, the guard sprang to their feet, and came to a salute. Seeing every one else stepping toward the wall, I did so, and, looking round, saw, close behind, a short, stout gentleman, in plain black clothes and beaver hat, with iron-gray hair and mustache, followed by a dozen officers in uniform, and a guard. He touched his hat in acknowledgment of the salute, and passed into the first room. A moment later I entered and asked the doorkeeper for the gentleman who spoke French. He showed me in. At the desk sat a handsome young officer, with short brown hair, mustache, and goatee, leisurely writing. I said to him:

"I was here yesterday, and left my card for the general; is he here?"

"Yes," said he, without looking up; "your card was given him yesterday; you had better ask the American minister to present you."

"My business is not from the American Government, and it is not worth while to trouble the American minister with it; I was told yesterday to call at this time, and that the general would see me."

"Yes, but he is unexpectedly busy. Write a letter stating your object, and you will receive an answer at your lodgings."

"I should much prefer to present my matter in person; it will be more satisfactory to the body I represent."

"Well, write and ask when he will see you."

"Can you send in such a note now?"

"No; bring it to-morrow."

"I was told yesterday that he would see me to-day; I should like at least to know to-day when he will see me."

Knowing something by Washington experience of the airs taken by great men's servants, and that such answers are mostly given to save themselves trouble, I had reasons for persistency. After some further discussion he wrote something on a sheet of gilt-edged note-paper, placed it in an envelope, handed it to a messenger, who disappeared at once behind a crimson curtain that overhung a high doorway nearly behind the desk, and said:

"I have sent your name to the general; wait a few moments, and we will see when he can receive you."

"Thanks. Does he speak English?"

"No; but talks French."

Almost instantly the messenger returned, and, lifting the curtain, asked me to enter. I found myself in a second room like the first, but darker and more deeply curtained. He led the way through a third room, like the second, and, throwing back a heavy door, ushered me into a spacious apartment filling the northwest corner of the building. Not a sign of richness here; not a curtain on one of half a dozen great windows; not a touch of gilding or color on the bare walls. One library-table stood on the right of the door. Between it and the wall sat a middle-sized man, not the least Spanish in look, not the least like the gentleman whom I had seen come in with an escort. This man looked like a German and the head of a bureau, with a half-worn, greenish-black coat, an old pair of steel spectacles, short, black, curly hair, sprinkled with gray, and standing up as if its owner often ran his fingers through it, and a bright-blue thread twining itself among the ambrosial locks that overarched his unconscious brow.

He rose hastily as I entered, and put out his hand. In astonishment hardly hidden, I asked:

"Is this General Prim?"

He assented with a low bow, and begged me to seat myself at the other side of the table. I did so, and said:

"I have credentials from the Universal Peace Union. This league, in my country, has publicly protested against war with Spain, and against the fitting out in the United States of Cuban privateers. Its president has directed me to inform you of these facts, and to assure you that our efforts to this humane end will go on."

I then showed him my credentials, the papers already named, and the resolution of the annual meeting at New York, in May, 1869 (offered by John B. Wolff, of Colorado), "That no consideration of justice or national policy can justify a war with Spain," the latter authenticated by my signature as secretary of the meeting; explaining the meaning of each.

As he looked at the documents and listened, I saw that he was shrewd, sly, wrinkled, careworn, and harassed. He looked about fifty-five, simple, stern, and relentless, though courteous.

To examine the writings he took up a pair of eye-glasses with broken tortoise-shell frame, and put them on his nose behind his spectacles. When he understood their meaning he smiled, bowed, and said:

"Please return my thanks to your society for its good offices. I have been in America, and remember with gratitude and pleasure the kindness and courtesy I met with there. The Government of Spain is anxious to end the state of war in Cuba, and to prevent barbarities while it lasts; but both, especially the latter, are far from easy."

"It would please my society if I could present my message to the regent in person. Is there an opportunity?"

"Yes; call at the palace, and he will receive you."

I then handed him the *Journal de Genève*, pointing out my letter to Victor Hugo, which contained a protest against the attitude of the International League of Peace and Liberty (taken at its then recent congress at Lausanne) in demanding revolution before peace, which demand defeated disarmament, and made the present war possible.

He read it with evident interest, and, when he reached the statement that the revolutionary position of the friends of freedom caused the fear that kept up standing armies, he laughed and said:

"Yes, yes, they want a general upsetting; nothing else will satisfy them."

"Will you give me a written acknowledgment that I have performed my mission?"

"Yes; send me a letter stating what you have told me, and I will file and acknowledge it."

When I rose he did the same, rang the bell, and the messenger opened the door. I said:

"It has been suggested that I should issue an address to the people of Spain on behalf of the Peace Union (having already addressed the government), urging them to abstain from civil war, and settle all their differences peacefully. What do you think of that?"

He started back, looked up sharply at me, and said:

"You can publish what you please; we have liberty of the press here."

As during the rebellion just put down he had suppressed twenty daily papers in Madrid alone, this was slightly comic.

Repressing a smile, I replied:

"Yes; but I wish to do naught that may embarrass the government in its difficult task. As far as such an address might be read, it seems to me that it would help both government and people. But, before acting, I desire to know your opinion, for I do not wish to say what you would disapprove."

"Thank you," said he. "It will be best to publish it, for it could not embarrass and might help us. Pray let me see it before publication."

"Shall I have then another opportunity to see you before leaving Madrid?"

"Yes, yes; come when you please, I shall be glad to see you if I can."

I then took leave. A day or two afterward a ministerial crisis took place in regard to the choice of a king. Several ministers resigned, and Prim took on himself, in the hope of reconciling them to remain in the cabinet, the temporary discharge of part of their duties rather than hastily make new appointments. Under these circumstances I scarcely expected to see him again; but prepared the address (which Señor Díaz, Under-Secretary of State, kindly translated into Spanish) and the letter.

The day before leaving for Paris I called again and left the letter, with a photograph of himself, and a request that he would put his signature beneath it. Receiving no reply at my hotel, I concluded that the letter had been overlooked in the pressure of business, and called in the morning. The civilian-employé already mentioned said Prim had worked from eight in the morning till eleven the previous night; the night before till two A. M.; and that he was admitting no one. I said I wished my answer and photograph. After much explanation and some delay, my name was sent in to the private secretary, who at once came out, and, on learning my errand, said the matter had escaped attention. He stepped in and brought out the photograph with Prim's signature attached, and said:

"I give you a portrait of the general; wait a moment and I will give you something more;" and quickly went out.

The officials passed the photograph about among themselves with exclamations of evident astonishment. A marked increase of respect was visible in their manner.

The secretary soon returned from the archives, and, passing into the room of the President of the Council of Ministers of Spain, brought out, with his chief's signature, the following note:

"PRESIDENCY OF THE COUNCIL OF MINISTERS,
MADRID, November 1, 1869."

"MR. J. K. H. WILLCOX:

"I have received your letter of yesterday, and much regret that the pressure of my duties makes it impossible to see you.

"At the same time I wish to convey my thanks for the sentiments you express on behalf of the Universal Peace Union as its worthy vice-president. You may say to its members that the Spanish Government cordially accords with every benevolent movement.

"Bidding you to accept the assurances of my esteem, I am,

"Yours, very respectfully,

"JUAN PRIM."

Prim at this time suffered under a chronic disease. This and overwork (which was plainly telling on him) probably weakened him,

so that the shock of bullets was more than he could outlive. The honors that are done him he earned; the errors he made he could hardly avoid.

JAMES K. HAMILTON WILLCOX.

THE DERBY COLLECTION OF PAINTINGS.

SOME time last summer, Mr. Henry W. Derby, of this city, went abroad for the purpose of making a selection of paintings of the French and Belgian schools. So successful was he that he was able to gather a collection which surpasses, both in merit and representative interest, any thing of a similar character that has ever before reached our shores, and which, having been added to the Fall Exhibition of the Academy of Design, is now accessible to the public.

We find, in this collection, works by such men as Baron Henri Leys, Blaise des Goffes, Rousseau, Maréchal de Metz, Ziem, Van Marcke, Alfred Stevens, Merle, Bouguereau, Tassaert, Brion, Jules Dupré, Emile Lafond, Fromentin, Daubigny, Baron, Charles Jacques, Bréton, Edouard Frère, Tschagggeny, Willems, Gallait, Koek-Koek, Backalowiz, Comte Calix, Leyendecker, Diaz, Isabey, Boutibonne, and others, less noted.

Without pretending to give an exhaustive critique on a collection where all the examples are excellent, and whose entire consideration would far exceed our space, we desire to excite public attention toward certain of the most highly-important works, and thus open the entire collection to that study and examination which it so richly deserves.

Specially characteristic of the artist are the two paintings by BOUGUEREAU, "Spring" and "Autumn." Here we have the rich ripeness of color and the fulness of form peculiar to the best child-painter of the century. Although, in these pictures, the two babies occupy, as it were, subordinate positions, yet they are made to predominate through their perfect faithfulness to Nature and their actual vitality. Cupidesque and delicious, they occupy and sustain the attention of the observer to the exclusion of their surroundings, which are, nevertheless, faithful and suggestive in design and treatment. These paintings were exhibited at the Exposition of 1867, and were highly commended.

VAN MARCKE. A large painting, representing a mountain-scene, down whose rugged road, and over whose rude bridge, struggle ox-teams, spurred on by their teamsters. There is a massive and sturdy energy and dogged perseverance depicted in the heaving flanks and heads writhing under the yoke, which are at once recognized as eminently characteristic. The scene is natural and artistic, and gives ample evidence of the powers which have brought Van Marcke to his high position and reputation as a cattle-painter. He was a pupil of Troyon, and resembles that master in his work.

TSCHAGGENY, EDMOND. A sheep-picture. Accustomed to the delicate touch of Verboeckhoeven, we had yet to see this animal painted with vigor and perfect truth. Not only is the soiled and matted wool a marvel of execution in detail, but the true sheepish and fatuous expression is so retained in the faces of the animals that you seem to be gazing upon the group from a window. The simple accessories—the rude fence, the little peasant-girl who tends her charge, the tone of the sky, subdued to bring in bolder relief the principal figures—are all true to Nature, and worthy of the highest commendation as efforts of art.

BARON HENRI LEYS, an artist who has, we believe, but one other illustration of his work in this country, is well represented by "The Message"—an interior of some quaint old mediæval apartment; a lady standing, her face reflected in a mirror, engaged in reading a note; and the messenger, a slight and graceful page, leaning, with plumed hat in hand, upon a harpsichord. In the background, in an elevated oratory, as it would appear, a female figure is dimly perceived, apparently sitting engaged over some feminine labor with the needle.

This painting grows upon you as you study it, and chiefly from the strange effect of light, which, proceeding from some window in the background, shimmers through the oratory in a mild flood of radiance, bringing into relief and elaborating by contrast the architectural and other features of the room. The two principal figures are full of easy grace, rich in warm color, and natural in pose and occu-

pation. The tapestry on the walls, the painted figures dimly seen in the distance, and the old-time furniture, are all to the life, and highly suggestive. The mode of treatment peculiar to this artist has given him the name of the Belgian pre-Raphaelite, though it is difficult to our minds to associate his work with that of Millais and Holman Hunt.

Born in 1815, Henri Leys was a member of the Royal Academy of Berlin, a commander of the Order of Leopold, and his paintings—since his death, a few years since—are the most difficult to obtain of any modern artist. An historical painter of high reputation, he is chiefly noted for his absolute accuracy in mediæval costumes and accessories, and for his marked originality in composition and grouping.

KOEK-KOEK. A fine landscape, showing broad conception and poetic idea in composition, with masterly art in delineation. The scene is eminently pleasing; the middle distance, in particular, being noteworthy for the broad grasp of expanse in a limited space, and with the simplest form of artistic means. The extreme distance is painted with every suggestion of appreciation, while the foreground is worked up with a just perception of the meaning of Nature, without too minute copying of her forms.

CARL HOF is a new German artist, his latest work being painted during the present year. We mistake if this artist do not achieve a reputation the highest in his school of all present painters. The picture before us, "The Unexpected Return," is the best exponent of a class of art of which Meissonnier illustrates the more morbid and eccentric features. A composition of figures, in which some central idea is illustrated by its apparent influence upon different physiognomies, and the actions of different individuals, is quite worthy of the painter's genius for elaboration. But, when all breadth of effect is belittled by minutiae of detail, and the sentiment of the work becomes lost in the microscopical delineation of mere accessories, the painting ceases to be a work of art, and is only a daguerreotype, more or less perfect. The present artist, while pursuing the design indicated by the title of his work, has not wasted his labors on insignificant accuracies, but has, instead, presented a broad and truthful scene, full of thought and character, and most felicitous in individual action and expression.

The sudden and unannounced arrival of a gay cavalier, surprising a brilliant and interesting family party at the latter course of a well-spread feast, has startled one, who is evidently his betrothed, from her equanimity, and surprised the others into natural and well-expressed manifestations of astonishment and delight. Meanwhile, the ruling idea being kept in the foreground, there is not the least negligence perceptible in the attention to details. On the contrary, they are wrought out with surprising fidelity, and with sufficient minuteness to give one interesting and pleasurable study, while they enhance without hiding the main theme of the picture. In lavish luxuriance of color, in graphic excellence and judiciousness of composition, and in vigor and characteristic fidelity of treatment, as well as in originality of conception, this picture excels any other we have ever seen here exhibited of a similar character.

E. VOLZ. A large canvas, on which is depicted a scene common enough, and whose natural features are preserved with life-like accuracy. A scattered drove of cattle are slowly retreating homeward before a storm, and in their wayward movements follow the customary habits of the animal as seen under such circumstances. Every incident in the scene is followed with fine art, and a thorough conception of the design. The individuality displayed by the cattle, so characteristic of them; the still pool of water in the foreground; the little dwelling, half hidden by trees, on the left; the bold, natural effect of the storm-clouds, altogether make up a broad and graphic picture, quite worthy to introduce to us this able and conscientious artist.

BLAISE DES GOFFES. His fidelity to Nature, and marvellous exactitude in detail are extraordinary manifestations of art. As a painter of still life, and in his capacity for defining the exact character and texture of the article or stuff he is depicting, he stands preëminent. The picture exhibited, "Still Life and Flowers," is a favorable specimen of his work. A jewel-case, a jewel-hilted dagger, a crystal vase of pleasing form, an agate or cornelian vase, ornamented in gold enamel; a small ivory statuette, a bunch of flowers, and a quaintly-painted china salver—with these aids, the artist has composed a group more interesting than are usually seen in these lifeless sub-

jects, and certainly presenting every possible charm of faithful adhesion to the character of the originals, and to harmony in the grouping.

MARÉCHAL DE METZ, an artist who ranks first in his school in Europe, and who has painted no more worthy examples of his power than these two remarkable paintings in pastel, considered the finest of their kind in the world. They are: "Christopher Columbus chained on board his Vessel," and "Galileo observing the Stars," painted for Prince Napoleon, who received and refused extraordinary offers for them from Lord Elcho and others. They were exhibited at the Exhibitions of London and Paris, attracted great attention, and are widely known throughout Europe.

In the one, Columbus crouches low on the deck of his vessel, manacled and chained, and, with head sunk in his hands, ruminates bitterly on the injustice of the world to which he had given a content.

In the other, the great astronomer reclines at night upon a couch before an open window, and with a small telescope watches the stars, while he notes their movements and position in an ancient manuscript volume before him. A cold flood of night-light partially illuminates his figure, and renders hardly visible the feeble flame of the small lamp by whose light he works; a frugal lunch and flask of wine is placed at hand, and, this being all of accessory there is, nothing robs from the prominence of the grand figure, a chief phase in whose life is thus depicted.

In these two extraordinary pictures we are brought to the consideration of themes calculated to rouse our highest interest, since they are delineated with skill and genius worthy at once the subject and the master. Few would believe that such masterly genius and vigor could find translation through such a medium as is here used. With no brilliancy of color, broad distance, or extraordinary utilization of the resources of *chiaro-scuro* to aid the painter, we have here produced a grand and worthy conclusion through the simplest instrumentalities. These two paintings deserve, and will doubtless receive, the most earnest and conscientious consideration from our connoisseurs and art-critics.

ROUSSEAU. A characteristic landscape by this master, whose treatment of earth, sky, atmosphere, and perspective, is at once broad, effective, and original. The small canvas before us is full of the peculiarities of the artist, and will be certain to arouse interest and curiosity.

BARON H. Several small cabinet pictures, of which the best is "The Petitioner;" a most pleasing group, full of character and action. Brilliant in color, and full of light and radiance, with a warm tone, the special attribute of this painter, this little work is one of the gems of the collection.

GALLAIT. "The Troubled Conscience." No more charming picture by this remarkable artist has ever been exhibited in this country. A suppliant, confessing her sins in evident agony of terror and remorse, kneels at the feet of a holy father, whose sad and pained countenance expresses a peculiar and earnest sympathy with the sinner and the crime. The artist's genius is powerfully shown in the utter abandonment of grief on the one hand, and the strong and manly, yet human and tender appreciation on the other. In its grasp of the special features of the subject, and in intensity of feeling and earnestness of meaning, this picture should be specially noted.

ISABEY. "The Duel," a scene in a forest, is marked with that lavish yet truthful vitality which marks the works of this artist. The scene is indeed life-like, and the animated character of the contestants, is made more perceptible by the surroundings of forest-shade and twilight gloom, amid which their brilliant costumes and fell purpose seem alike incongruous and misplaced.

BILLET. A scene representing a group of "Card-Players" is full of interesting play of feature, and is artistically worked up and naturally composed.

But, space failing for special remarks on other paintings in this exhibition, we must be satisfied with pointing especially to such as are most noteworthy, leaving our readers to attest our selection or confute it by their own taste. Such seem to be—

J. L. BROWN'S two "Hunting Scenes;" large paintings, full of animation and life-like.

ALFRED STEVENS. Picture of a young lady, apparently a prima-donna at rehearsal, which will bear examination.

JACQUES. An enormous canvas, sustaining sheep, tended by a peasant, which would be most highly considered but for comparison with the painting by TSCHAGGENY, before considered.

BRION. "The Skittle-Players."

CHAPLIN. A most charming figure of a girl and cupids; brilliant in color, and vivid in the modelling of flesh and the glow of youthful beauty.

Two paintings by EDWARD FRÈRE are fair examples of his style, but not equal to others of this artist which have been previously exhibited.

BOUTIBONNE, FROMENTIN, ZIEM, and others, will attract, as honorable specimens of well-known artists.

SLANDERED NEIGHBORS.

ANIMALS, like men, are often sadly misjudged. Some are praised and honored for imaginary virtues, which they never possessed; and others are hated and persecuted, who are far better than their reputation. This is especially the case with animals which are not directly useful to man. He sees every virtue in those he has domesticated, because they render him manifold services; but the poor, nocturnal animals, which are forced to go in search of their food under the shelter of darkness, whose life is unknown to him, and whose forms are not pleasing to his eye—these he views with disgust and persecutes with unrelenting severity. Popular legends connect them with evil spirits; superstition endows them with marvellous but malignant powers, and gross ignorance ascribes to them a thousand misdeeds and grievous crimes, of which they are not only innocent, but utterly incapable.

And yet it is not only the duty of man, but all-important to his success in garden, field, and forest, that he should know which are his friends and which his foes among the countless hosts by which he is constantly surrounded. He may kill his best friends, thinking them his enemies, as the Italians do, when they slaughter mercilessly the little birds, which we import at considerable cost and entertain with lavish hospitality, or he may admire and cherish beautiful creatures, which in reality are either utterly useless, or actually his worst enemies. Nor can he ever hope to be as successful in his crusades against really dangerous foes as the agents are which Nature herself has appointed for the purpose. All the professional rat-catchers of England do not destroy as many rats in a year as the owls of a single county do in a month; to say nothing of the fee they demand, while the owls do their work without charge. The difficulty becomes still greater, when the enemy is almost invisible, as is the case with many worms and maggots, which escape our observation, while the marvellously sharp eye of the bird or the insect, that feeds on them, sees them at a glance. Thus a renowned naturalist, Fabre, of Avignon, noticing that a certain wasp always chose a large black beetle, in order to use its fat body as a depository for its eggs, was very desirous to procure one or two of these unlucky creatures. To make quite sure of the species, he managed first to rob the wasp several times of its prey on its return to the nest; but in ten minutes, on an average, the indefatigable wasp invariably brought a new victim home. Then the professor himself went on his hunt, armed with his supreme intelligence and all the ingenious contrivances devised by man's wit for the purpose. What was the result? After two days' incessant work in vineyards and clover-fields, searching through meadows and hedge-rows, stone-heaps and waste strips of land, he returned, crestfallen, with three wretched specimens in such a state of mutilation that no wasp would have thought them worth catching!

Men speak much of the calm peace that reigns in Nature! Peace forsooth! It is all war, incessant, merciless warfare, throughout all the realms of Nature. Men lie on the soft, green moss, under the dim shadow of wide-spreading branches, near the bank of a purling brook, at the hour when the great Pan is asleep, and all seems peace and harmony to them. But nothing is more treacherous than this impression. That tiny, bright-colored bird, which the eye follows with delight as it flits from branch to branch, ever and anon uttering a sweet, low note, is bent upon murder, and is all eagerness to catch the golden flies sunning themselves on the green leaves. The wood-

pecker, whose busy, merry knocking is heard from afar, feasts upon worms and beetles which he tears ruthlessly from their dark homes; and the beautiful dragon-flies, which dash merrily, and as if in mere wanton sport, across the bright water, are even then pursuing their own brethren with hideous voracity. Is the ibis, whom the old Egyptians worshipped as a deity; is the stork, viewed by thousands with a feeling of almost sacred awe; is the swallow, to whom we grant a home under our own roof-tree, less of a murderer than the buzzard whom we nail ignominiously to our barn-door, or the mole whom we kill without remorse, whenever we meet him on his nightly wanderings?

Among the prejudices cherished by the masses against harmless animals, few are stronger than that felt almost universally against bats, arising probably from the simple fact that they are children of the night, and forced to carry on their search after food in darkness. It may be, however, that their peculiar hideousness has given additional strength to this feeling, for the Jewish legislation already declared them unclean and accursed, and the Greeks borrowed their wings for the harpies, as Christians have done for the devil. A poor, lost bat need but fly into a room filled with company, and everybody is frightened. Superstitious people tremble at their mere presence as an evil omen, and the stronger-minded among the fair excuse their terror by a pretended fear for their hair—an apprehension which could be well founded only, if the accounts of insects being harbored in their chignons should be verified. It is true, these children of darkness are neither fair in form nor amiable in temper. The naked, black skin of their wings, stretched out between enormously-lengthened fingers, like the silk of an umbrella between the whalebone of the frame, the ugly claws of their hind-feet, the bare appendages which frequently adorn their noses and ears in the most eccentric manner, and their perfectly noiseless, almost mysterious flight by touch, and not by sight—all these peculiarities combine to make them unwelcome guests among men.

And yet they are real public benefactors. When the first warm sun of spring arouses them from their long winter sleep, which they enjoy hanging by their hind-feet, head down, and the whole body carefully wrapped up in the wide cloak of their wings, they begin their night hunts. A dozen fat beetles barely suffice for the supper of a hungry member of one variety, and sixty to seventy house-flies for one of another kind. All night long they pursue with indefatigable energy every variety of beetle and moth, of fly and bug, and enjoy most of all those which do the greatest injury to our fruit-trees and cereals. Even the only really formidable member of their race, the vampire, is much maligned; a gigantic bat, accused of sucking the blood of man and beast, it is strictly confined to a small district in the tropics, and even there occurs but rarely.

As bats are the indefatigable hunters of the air, so moles are incessantly at work underground. At the first glance, they show their admirable adaptation for a life beneath the turf. Their thick, round body, with its close, silky fur-coat; their sharp-pointed snout, with a long, exquisitely-sensitive trunk, like that of a miniature elephant; their broad, spade-like feet; their almost invisible eye, hid under a forest of stout hairs, and the absence of an external ear—all fit them for their active life and fierce warfare in utter darkness. They move in sandy soil at least as swiftly as a fish in water, and they are true Ishmaelites, having no friends among other animals, nor, their mates alone excepted, among their own kindred. The common prejudice, however, that they injure gardens and fields by gnawing roots, is utterly unfounded. This is easily proved, for, as of men, Brillat Savarin could say: "Show me what you eat, and I will tell you who you are!" so of animals we can say: "Show us their teeth, and we will tell you what they eat!" The mole has not less than twenty-four good-sized teeth: some, eye-teeth, shaped like sharp daggers; others, molar teeth, resembling a combination of formidable saws. Such destructive instruments are not given to vegetarians. Nevertheless, farmers and gardeners assert almost universally that moles are granivorous—another proof of the utter falseness of the old saying, "*Vox populi, vox Dei.*" For, next, naturalists have examined the stomachs of moles, and what did they find? Not a trace of vegetable food, but an abundance of half-digested earthworms, large quantities of hard, brown scales, and horny shields, and remnants of caterpillars and worms innumerable. In order to demonstrate the fallacy of the common prejudice beyond all doubt, Flourens, the secretary of the

Academy of Sciences, in Paris, put two moles into a cage, with an ample supply of roots and beets for their food. The next morning he found the roots untouched, but only one mole; the other had been devoured by the survivor! A few hours later, the poor mole showed signs of weakness and exhaustion; a bird was put into his cage, and instantly the mole rushed upon the poor sparrow, disembowelled him, and did not rest till he had eaten more than half of his body. After his repast, he appeared once more plump, and became quite lively. The same experiment was several times repeated, till one night the mole was left in its cage with a large supply of lettuce, cabbage, and beet-roots. The next morning it was found dead; it had died of starvation! The only injury which moles really do is caused by their long passages and frequent mole-hills, by which roots are loosened and meadows disfigured; but this stands in no proportion to the incalculable benefit they bestow upon man by destroying the numerous enemies of plants in gardens and fields, which dwell underground, and are invisible to human eyes, especially worms, maggots, and so-called mole-crickets. Of these they consume daily more than half their own weight! Hence it is that skilful gardeners, after having overcome the old-fashioned prejudice against toads, which now are carefully kept as the best protection of the most valuable plants, also begin to appreciate the merits of moles, and actually purchase them in early spring, to make them useful in cleaning their gardens and fields both thoroughly and promptly.

Another animal, unjustly despised and mercilessly persecuted, is the hedgehog, a perfectly harmless creature, fond of peace and goodwill among neighbors, and quite a titbit to the palate of French peasants. Fast asleep during winter in its warm, cosy bed, under a large stone or the interlaced roots of a tree, it comes forth in early spring to hunt for its prey along hedge-rows and sunny banks. Its peculiar endowment is a powerful muscle under the skin, which enables it to roll itself up into a perfect ball, presenting on all sides a formidable array of sharp-pointed quills. The air of defiance which this gives to the poor, helpless animal, seems to provoke the desire of boys especially, to compel a surrender. They are thrown into the water, they are tickled with reeds and thorns, and the most cruel means are employed to induce them to give up their defence, efforts which almost uniformly end in their death. To excuse the wanton cruelty, the innocent animal is charged with every kind of crime, and yet it little deserves such harsh treatment. It is true, the hedgehog is not exclusively carnivorous, as the bat and the mole; it loves a little fruit at times, and even finds its way into the dairy in search of cream and butter; but it does not, as many believe, climb into fruit-trees, gather pears and apples on its quills, and then triumphantly carry home its ill-gotten wealth to its young! It lives upon insects, snails, and beetles, which it either catches running, or digs out with its nose and its claws; above all, it is fond of field-mice. In this respect they are far more useful even than cats, and would have been long since domesticated but for their unpleasant odor and the great noise they make when out on their hunting-expeditions. If they lack agility and swiftness, they succeed by patience and cunning, and their boisterous efforts frighten away even more mice than they destroy, so that they are most useful in barns and stables.

Another striking peculiarity of hedgehogs is their insensibility to animal poisons, a privilege which rests by no means upon popular tradition only, but has been abundantly proved by repeated experiments. The great Russian zoölogist, Pallas, saw a pet hedgehog of his feast to its heart's content upon Spanish flies, although no other animal touches them, on account of their powerful acrid juice. A German naturalist placed repeatedly the most venomous of European serpents, a viper, into the same cage with a hedgehog, and in every instance the latter, though severely bitten by its agile and formidable adversary, finally obtained the victory and devoured the enemy. Other savants go still further, and claim that, like cockroaches, they can eat arsenic, opium, and corrosive sublimate, with impunity; but this remains to be authenticated. It is surely quite enough if the poor, persecuted creature destroys thousands of the most dangerous enemies which man has to encounter in tilling the ground, and, moreover, defies the ancient foe of his fall, the serpent. Instead, therefore, of the cruel treatment which it receives, it deserves to enjoy the same tender regard which we pay to useful domestic animals, the true and faithful friends of mankind.

SCHELE DE VERE.

TABLE-TALK.

WE do not escape, even at this late day, discussions as to the influence of war for good or evil. The other night, when listening to Mr. Robertson's comedy of "War," a very animated discussion between two of the characters as to the glory and the misery of war, recalled an eloquent passage in Alison's "History of the French Revolution," which, when it first appeared—we were then in our "green and salad days"—impressed and exalted us mightily. Referring to it as soon as convenient, it seemed worth while reproducing it here, for the sake of showing how fallacious are the arguments of the best writers in defence of what we hope in time to see recognized as nearly an unqualified misery. "That war," says Alison, "is an unbounded source of human suffering to those engaged in or affected by it, can be doubted by none. But is not suffering necessary to the purification of the human heart? Is it not in that ordeal that its selfishness, its corruptions, and its stains, are washed out? Have we not been told by the highest authority that man is made perfect by suffering? Is not misfortune, anxiety, and distress, the severe but solitary school of individual improvement? And what is war but anxiety, distress, and often agony, to nations? Its great and lasting effect is to counteract the concentration of human interests upon self, to awaken patriotic and generous affections, to rouse that generous ardor which, spreading from heart to heart, obliterates for a time the selfishness of private interest, and leads to the general admission of great and heroic feelings. Peace exhibits the enchanting prospect of rich fields, flourishing cities, spacious harbors, growing wealth, and undisturbed tranquillity; but beneath that smiling surface are to be found the rankest and most dangerous passions of the human heart. There it is that pleasure spreads its lures, and interest its attractions, and cupidity its selfishness. There are to be found the hard-hearted master and the reckless servant, the princely landlord and the destitute tenant, the profligate husband and the faithless wife. Amid war are to be seen the ravaged field and sacked city, the slaughtered multitude and famished group, the tears of the widow and the groans of the fatherless; but, amid all that scene of unutterable woe, the generous and noble affections often acquire extraordinary force; selfishness gives place to patriotism, cupidity to disinterestedness, luxury to self-denial, and heroic virtue arises out of suffering. . . . Peace may give men a larger share of the enjoyments and comforts of the world, but war often renders them fitter for a future state of existence." That some measure of truth may be discovered in all this, we will not question. There are very few evils, indeed, without their compensations; but it is no defence whatever of a misfortune to point out certain indirect advantages that may spring from it. We may console ourselves for what we suffer by reflecting upon those circumstances that mitigate the evil, but a misfortune is still an infliction notwithstanding our ingenuity in detecting or imagining certain favorable consequences. As

to the virtues which Alison eloquently depicts as arising from war, we dispute them nearly altogether. The effect of war is to intensify selfishness. It makes men reckless of their own lives, and reckless of the lives of others; it hardens them to suffering, renders them indifferent to calamity, and extinguishes all the nicer refinements of feeling and perception. Question any man who has served in war; elicit from him the facts of camp-life, the incidents of the battle-field, the circumstances of the march or the forage. We shall discover that here, and not under the "enchancing prospects of peace," are to be found "the rankest and most dangerous passions of the human heart." If war sometimes teaches self-denial, it as often permits self-indulgence. If in war occasionally the "generous and noble affections acquire extraordinary force," more frequently the rudest and most brutal instincts are developed, and innocent, gentle youth are transformed into profane, ribald, sensual, reckless men, most unfitted, the ordinary critic would suppose, "for a future state of existence." The idea of war being a discipline for heaven is certainly very original with the Tory historian, and might be commended to the consideration of the Evangelical Alliance. But the immoralities of war are too well known to need pointing out. The essential fallacy in the historian's eloquent sentences is the assumption that war alone affords full opportunity for self-abnegation and heroism, and that the consequences of uninterrupted peace are ease, selfishness, luxury, a sloth of mind, and a decay of virtue. Life under very few of its aspects exhibits this picture. Luxury, ease, and sloth, are, in the most prosperous conditions of a people, the fortune of very few; the great multitude need no wars to teach them self-denial, no fire and sword as means of a salutary distress, no slaughter to extinguish selfishness. Fortitude is the daily lesson of the poor. Self-suppression is the one unvaried experience of their lives. To labor, merely that they may eat; to undergo ceaseless hardships; to struggle with disease, and bear up under loss of loved ones—these are the unobtrusive, silent heroisms of the great bulk of mankind, and no new distress or agony can be needed to awaken those virtues which the historian describes. Even men of superior rank have always the severe discipline of life—misfortune, sickness, death—as the "salutary school of improvement." They need no "sacked cities, slaughtered multitudes, famished groups," to prepare them "for the duties of this life, or to fit them for a future state of existence." That certain luxurious men, who ever the "primrose paths of dalliance tread," may be stirred, awakened, and elevated by war, is doubtless true. And the approach of war often arouses a whole people into one sympathetic burst of patriotic enthusiasm. But the real effect of war is in the end to bring out the worst passions of men; and, for what good it may bestow with one hand, it sheds with the other a hundredfold of ruin, both physical and moral.

—When, a few years ago, a popular weekly journal, in this city, began to give publicity to many purely private and domestic matters, there was a general outcry against

it. The proprietors, however, discovering that where they lost one subscriber, on account of this objectionable innovation, they gained two, persisted in their purpose; and their success in chronicleing the very small beer of society, the balls and parties given by the nobodies, the betrothals which no one but the persons concerned, one would suppose, could care about, the comings and goings of would-be fashionable people, has induced a very general imitation of the thing throughout the country. It would appear that this matter of social gossip has passed through the same experience that Pope assures us is the case with vice, which "we first endure, then pity, then embrace." Recently a journal, expressly devoted to recording the matters that in the old, dull times were supposed to be sacred to the home-circle, has appeared in New York under the title of *Our Society*, and in Philadelphia an evening paper has rushed into the public chronicleing of strictly private affairs, with a boldness and dash that are enough to take one's breath away. But, while *Our Society* gives frankly full names, the Philadelphia reporter has not as yet ventured beyond initials. Initials, however, in his brilliant hands are more entertaining than Smiths and Browns and Robinsons discussed in prosaic English. *Our Society* tells us that "Mr. Matthew Bird, of West Twenty-second Street, visited his *fiancée*, Miss Mary E. Beatty, at her home in Norwalk, Conn., during the holidays." This is as direct, circumstantial, and matter-of-fact, as it is unnecessary, although we hope Mr. Bird enjoyed his visit. The Philadelphia fellow, in a more vivacious and delightful way, tells us that "Mr. S. H. L.—d thinks he is a particularly 'bright star,' to which the Woodbury ladies are irresistibly attracted." *Our Society* says that "Miss Kate Raymond, a charming young lady from Bordentown, N. J., is visiting her friend Miss Bordenhamer, of Fifth Avenue" (will the time come when our daily papers will have to be enlarged, to make room for this sort of intelligence?); but from Philadelphia we learn that "every one declares that the beautiful Miss L. E. is 'sweet.'" *Our Society*, in fact, is altogether behind its Philadelphia rival in spirit and *vim*. Its five columns, in the number now before us, of the names of ladies who received on New-Year's day, in New York, are about as bright and fresh as the directory. The list of ladies, and the days for their regular receptions, are not a whit more interesting, excepting to those people who go to it for their invitations. But the gossip of our sister-city is another thing. Here are a few more examples, which we transcribe for the edification of our readers: "Miss Mattie M—e looks well in green plaid." "Miss E. Z. looked charming in her blue silk, last Monday." "Miss B. S., of Greene Street, is always pleasing to the gentlemen, and dresses with taste." "The charming Miss — was radiant at the sociable, on Thursday evening." "The beautiful Miss Anna S—h, of Wallace Street, converses delightfully." "Three young gentlemen would like to know why Miss P. S. did not speak to them last Sunday?" (Is this query made in this manner by the three young gentlemen, to save letter-paper and postage, to insult a young lady, to show themselves asses, or is

it the dire invention of the editor?) "Miss L. C. is fond of fruit-cake." "Miss P. C., of North Twenty-first Street, has lovely eyes." The reporter has as many favors for polite young gentlemen of the street and the *salon*, but with the men what little modesty remains disappears entirely, and names, in full, are paraded for our delectation. "Mr. Harry Rosenbaum," we are told, "looks *dégagé* in his high hat." "Mr. Henry B. Neymer likes to dance the *Trois Temps*." "Mr. F. D. Howard sports a new high hat, which becomes him very much" (from which one may suppose that "high hats" and "new hats" are rare in Philadelphia society). "Mr. Cox, of Jefferson College, has handsome whiskers," but the "ladies say they would admire Mr. Frank Town better without his goatee;" and so on for over seventy paragraphs. How the Philadelphians like this sort of thing, we have no information; but the confidence with which the thing is published, would indicate that the editors know what they are about. It is reported, in this city, that *Our Society* is a success. People like so well to see their names in print, that they appear to take as much morbid delight in seeing themselves pilloried in this brazen fashion as a forger or a murderer experiences, it is said, in reading his own trial and sentence.

—"Richelieu" seems to us the best of Bulwer's plays, if it is not the best acting drama of the century. It is adroitly managed as to story, character, and situations. It has a good love-story, well calculated to enlist the sympathies of an audience; it deals in intrigue, craft, plot, and counter-plot; it borrows dignity and derives interest from great historical names; the scene is laid at a period admitting of picturesque contrasts; it is full of fine dramatic surprises, and has some of the most telling situations the drama affords; it is coherent, deftly constructed, moving always with steady pace and growing force to its climax; it is designed in its literary excellence to please refined minds, and in its powerful scenes to arouse the interest of ordinary intelligences; it is, in brief, a play happily balanced throughout, so as not to be beneath culture or "caviare to the general." The part of Richelieu was first acted, our readers will probably recollect, by Macready, who made it one of his best renditions. Forrest, to our minds, is happier in this part than in any other. Edwin Booth is considered in Richelieu only second to his Hamlet. It is a part not difficult to play. There is no uncertainty in the character, no complex or contradictory motives, no springs that the ordinary plummet cannot sound. Any actor skilled in his profession ought to be able to make an impressive picture of it. The fine contrasts of sternness and humor, of cunning and courage, of tenderness and severity, of pride and humiliation, of ambition and patriotism, are entirely comprehensible, and can easily be managed. But, if the play possesses no intellectual difficulties, it affords opportunities for the exhibition of the highest dramatic genius. And hence all our leading actors like to play it. When Mr. Booth produced the play some years ago at "Winter Garden," we cannot say his performance altogether pleased us. It seemed raw and crude, noisy

and theatrical, and quite inferior to Mr. Forrest's more careful and artistic rendition. But as he is now acting it at his theatre there is great improvement. There is complete and elaborate filling in; there is admirable reserve of force, and consequent concentration of effect in the powerful situations; there is full and adequate expression of all the gradations of feeling and passion; there is complete and admirable individualization of the character. It is excellent to see Mr. Booth so studious, so advanced, so determined to achieve the fullest triumphs of his art. We would urge him to rid himself altogether of one defect, now not nearly so marked as in former years, but which still adheres somewhat, of laying too much stress on minor words, thereby rendering the delivery stiff and hard. In reading, the use of *slur*, in lightly touching minor words, is important for a free, flexible, and agreeable utterance. Richelieu is produced superbly. It has been a long time in preparation, and every thing that scenic art could do to present a perfect picture of the era has been availed of. The pictorial feature of the representation is not allowed, however, to subordinate the actors, but is used skilfully and with rare taste to strengthen and aid them. "Richelieu," as it appears at Booth's Theatre, is a magnificent page out of a grand history; it is well worthy actors, scenic artists, and the attention of the most critical.

Scientific Notes.

Cave-paintings by Bushmen.

MR. GEORGE W. STOW, of Queenstown, South Africa, refers in a letter to the interesting subject of the old cave-paintings by the Bushmen, as follows: "During the last three years I have been making pilgrimages to the various old Bushman caves, among the mountains, in this part of the colony and Kaffraria; and, as their paintings are becoming obliterated very fast, it struck me that it would be well to make copies of them before these interesting relics of an almost extinct race are entirely destroyed. This gave rise to an idea in my mind, of collecting materials enough to compile a history of the manners and customs of the Bushmen, as depicted by themselves. I have, fortunately, been able to procure many fac-simile copies of hunting-scenes, dances, fightings, etc., showing the modes of warfare, the chase, weapons, disguises, etc. This promises to be a collection of very great interest. In some places, it is astonishing to what a degree of perfection some of the wild artists had arrived. I have found three different series of paintings, one over the other; and, as the most recent must be upward of fifty years old, the undermost are most probably very ancient. The colors are very permanent, and would last for ages, if not wantonly obliterated. Unfortunately, the Kaffir herds and others are constantly destroying them, and, by the time another generation has passed, few remains of them will be left. The pigments used in the caves were derived from ochreous concretions, abounding in some of the sandstones of the Karoo series of the interior of South Africa, as in the Rhenosterberg, Stormberg, and elsewhere. These concretions, when broken open, supplied the natives with paint-pots, and from among the several colors

of yellows, browns, reds, etc., the chocolate was selected for painting the human form in the caves."

The French *Académie des Sciences* has held its sittings regularly since the commencement of the siege of Paris, and the *Comptes rendus* has been published regularly every week. Every sitting is reported fully, and several numbers have had even more than the average number of pages. A large part of them is devoted to military science and to ballooning. The scheme put forward by M. Dupuy de l'Ome, was fully discussed and illustrated by copper-plates: an article contributed to the *Presse*, by Mr. Giffard, the celebrated engineer, when reporting upon his aerial experiments as much as twenty years ago, has been reprinted. It was shown that Dupuy de l'Ome's experiment was almost of the same nature, and the *Académie des Sciences* has apologized for not publishing it in proper time. M. Dumas and M. Elie de Beaumont, although members of the former senate, now act in their capacity of *secrétaires perpétuels* of the Academy. M. Leverrier has not appeared at any of the sittings. M. Chasles is most punctual in his attendance. Lectures are given at the *Conservatoire des Arts et Métiers*, and are to be given at the *Collège de France*. No lectures have been given this session at the *Sorbonne*. Since the commencement of the siege, a few numbers only have been issued of the *Revue des Cours Scientifiques*; *Les Mondes* and *Cosmos* have been entirely suspended.

A large number of the animals at the *Jardin des Plantes* and *Jardin d'Acclimatation* have been sold and slaughtered for food, even the bears having now been sacrificed. The trees in the latter garden have been almost entirely cut down either for charcoal or for the necessities of the defence.

War Notes.

Gambetta.

THE world will think very highly of M. Gambetta when the war is over. He has been the one capable man whom France has produced. It is he that has continued the war. It is he that has lifted up the name and fame of France after the dishonor of Sedan. He has given his country, for three months, courage, unity, organization. He made the Army of the Loire, which was a very creditable army, and is even now fighting on, although at the critical moment it could not hold its ground against the discipline and steadfastness of the Germans. He found a general who was at least successful in one engagement, and had enough military knowledge to avoid a repetition of the blunders of McMahon. He has been blamed in England for interfering with D'Aurelles before he finally retreated from Orleans, and for proposing to inquire subsequently into the circumstances which led to that retreat. This blame is, we think, wholly unmerited. No civilian, having the whole fortunes of a great country depending on him, having by unceasing efforts got together and equipped and organized under the most discouraging circumstances an enormous army, would have learned, without a word of remonstrance, that the general he had chosen proposed to retreat at the very crisis of the fortunes of the nation. When D'Aurelles insisted that, as the general in command, he must know best, M. Gambetta at once acquiesced; but, so little did General d'Aurelles know his own mind, that he subsequently sent back to say that he thought he could continue the struggle with advantage.

But, although a government must allow a general to take a decisive step as to the necessity of which he can judge and the government cannot, it is nothing short of the duty of the government to inquire subsequently into the circumstances which have led to a great national mortification and calamity. But M. Gambetta, whose action is now the action of France, had to consider not only what would happen. He had to consider what would be the best course for France that he could take; and he has decided that he ought to go so far toward making peace as to propose an armistice. It must have cost him a deep pang to have brought himself to such a conclusion; but he has acted like a bold and honest man in not allowing his private feelings and interests to stand in the way of doing what he must have considered to be a painful public duty. Count Bismarck has freely blamed him and his colleagues for usurping the government of France, and preventing France from expressing its real feelings and wishes. All that can be said in reply is that France has amply ratified the decision of M. Gambetta. France did not want an armistice, or peace, or the meeting of a national assembly. It wanted war; it wanted to fight; if possible to save Paris, and to drive away the invader; and at least to regain honor and consideration in Europe. For this end it needed a man who would and could govern, who could raise armies and decide who should lead them; and such a man it found in M. Gambetta. He has doubtless committed numerous blunders, as he certainly has, whether intentionally or not, been audacious in his mendacity. But he has done what he offered to France to do, and what France wanted and allowed him to do.

Lorraine—1871.

I.

Sweetly the June-time twilights wane
Over the hills of fair Lorraine;
Sweetly the mellow moonbeams fall
O'er rose-wreathed cottage and ivied wall.
But never dawned a brighter eve
Than the holy night of St.-Geneviève,
And never moonlight fairer fell
Over the banks of the blue Moselle.
Richly the silver splendor shines,
Spangles with sheens the clustered vines,
And rests, in benediction fair,
On midnight tresses and golden hair.
Golden hair and midnight tress
Mingle in tender lovingness,
While the evening breezes breathe upon
Marie and Jean—and their hearts are one!
The spell of silence lifts at last—
"Marie, the saint's sweet day is past!
Her vesper-chimes have died away.
Where shall we be on New-Year's-day?"
With answering throb, heart thrilled to heart,
Hand met hand with sudden start.
For in each soul shone the blessed thought,
The vision fair of a little cot
Nestled beneath the lilac-spray,
Waiting the blissful bridal-day.
Low bowed in tearful silence there,
Their hearts rose up in solemn prayer;
And still the mellow lustre fell
Over the banks of the blue Moselle,
And still the moonlight shone upon
Marie and Jean—and their hearts were one!

II.

Six red moons have rolled away,
And the sun is shining on New-Year's-day.

Over the hills of fair Lorraine,
Heaps of ashes and rows of slain!
Where merrily rang the light guitar,
The angry tramp of the red hussar
Flings on the midnight's shrinking breath
The direful notes of the dance of Death!
Underneath the clustered vines
The sentry's glittering sabre shines;
Over the banks of the blue Moselle,
Rain of rocket and storm of shell!
Where to-day is the forehead fair
Crowned with masses of midnight hair?
A summer's twilight saw him fall
Dead on Verdun's leaguered wall.
Where, alas! is the little cot?
Ask the blackened walls of Gravelotte.
Under the lilac broods alone,
A maid whose heart is turned to stone;
Who sits, with folded fingers, dumb,
And weepily prays that her time may come:
Yet see! the Death-god's baleful stare,
And War's black eagle screams afar;
And lo! the New Year's shadows wane
Over the hills of sad Lorraine.

Miscellany.

Literary Speakers.

THERE are many men who possess every gift by which the most brilliant after-dinner speakers are distinguished—imagination, wit, keen powers of ridicule, a polished style—all except one: sufficient strength of nerve to stand upon their legs for ten minutes in the presence of two or three hundred pair of eyes. At their desk, with a pen in their hands, these men are perhaps among the most thoughtful and suggestive of writers; and over a glass of wine, with half a dozen friends, the liveliest and most sparkling of talkers; but the instant they feel themselves on their feet, asking permission to propose a toast, or acknowledge their own health, they sink to the level of the ordinary stutters of commonplace. Thackeray belonged to this class. It was a positive torture to him to be called upon to make an after-dinner speech. "Why don't they get Dickens to take the chair?" he used to say, peevishly, when a deputation had just pestered him into attending their anniversary at the London Tavern. "He can make a speech, and a good one. I'm of no use. They little think how nervous I am; and Dickens does not know the meaning of the word." And this was the fact. Thackeray scribbled out a draft of all his speeches, and revised, and altered, and polished them as he did a chapter in "Pendennis" or a "Round About Paper," and then learned them by heart. But it was a thousand chances to one whether he got through half of what he had thus prepared, and, whether he did or not, he was like a toad under a harrow all the evening, and very seldom made the slightest play with his eloquence.

And this is generally the case with men of Thackeray's type. It was the case with Theodore Hook. In a club smoking-room the witty editor of *John Bull* would mount the table and keep a select circle of boon companions laughing for a couple of hours, by mimicking the style of most of our parliamentary orators, Peel, Palmerston, Croker, Althorp, "the brilliant Baron," Lyndhurst, Brougham, and Follett, reproducing their style, their thoughts, all their little affectations and tricks, with astonishing fidelity. Yet, when called upon to put a few sentences together at a lord-mayor's din-

ner, the keenest wit in London was brought to the stand-still at his third sentence for a thought or a phrase, and never, it is believed, in his life, got beyond a dozen sentences. Pen in hand, Jeffrey was the most fluent of men. He threw off page after page of a slashing criticism for the *Edinburgh Review* in the course of the evening, without a single erasure or interlineation, without even a pause for a word. But at a dinner-table it was a mere chance of hit or miss whether his speeches were brilliant successes or contemptible failures; and, in the most important after-dinner speech that he was called upon to make, that of proposing the health of Charles Kemble when presenting him with a testimonial in the name of the City of Edinburgh, he broke down at the very outset of his speech, and had to sit in confusion and shame. Lord Lytton's speeches read well, but to listen to them as they fall from the lips of their author they are as flat as champagne in decanters. Goldwin Smith is ineffectual. Anthony Trollope is surprisingly feeble, although, perhaps, now and then, as in his recent speech at the anniversary of the Newspaper Press Fund, you may trace a flash or two of the author of "Barchester Towers." Froude is as dull as an alderman. Edmund Yates is pert. Sala talks like a school-boy repeating a half-learned lesson. Tennyson, it is said, has never risked his reputation by the slightest attempt at any kind of eloquence; and Longfellow systematically refuses to touch a toast-list even with a pair of tongs. These names run so high and so low, in the ranks of literature, that one would be disposed to lay it down as a rule that poets, novelists, and historians, are not of the stuff that brilliant after-dinner speakers are made of. Their intellects are not sufficiently flexible. Their wit is not portable. Their nerves are too weak. Charles Dickens was, probably, the only exception to the rule; and, with Charles Mathews and Mr. Lowe, he was the best chairman in London. He never lost his balance. His wit was always sparkling. His strokes of humor never failed to tell. He was as much at his ease at the head of the table with two hundred guests, as he was in his own library-chair throwing off a page of dialogue between Mr. Grengious and Rosa. He did not know what nervousness was. "The first time I took the chair at a public dinner," he told one of his friends, "I felt just as much confidence as if I had done the same thing a hundred times before." And his fluency was equal to his self-possession. He was never at a loss for a happy expression, a bit of humor, or a telling anecdote.

A Levee of Charles V.

The court circles in Madrid have recently been indulging in a ghostly sort of picnic. The minister of state invited the diplomatic body to accompany him to the Escorial. The court journals give a decorous account of the expedition, showing how "they arrived at the royal seat in a vernal temperature, and at once directed themselves to the palace, which they visited with minuteness. They then passed to the grandiose monastery of St. Lawrence, which they went through, expressing their admiration of the rigid architecture of the immortal Herrera, the tapestries and other works of art contained in this eighth wonder of the world." Here the official account discreetly goes off into generalities, veiling the great event of the day. We have seen a letter from one of the participants in these Castilian high jinks, which enables us to supply the hiatus of the chronicler. The party was introduced to the corpse of Charles V. himself, whose sarcophagus, in the great crypt under the chapel, had been opened for the occasion. There was a scaffold in front of the niche appropriated to the great Austrian,

with ascending stairs, and the heavy coffin-lid was slid back on beams—disclosing the mortal shell of Charles Quint. The clothes had mouldered away, and some priestly tinsel was thrown over the mummy, to hide its dry, brown nudity. The chest was bare, massive, and drum-tight, giving a hollow sound when tapped, and still measured thirty-six inches, after the waste of centuries. The head was thrown back a little, and the forehead bound with a gold cloth. There were no eyes—only a pair of plastered-up pits. There was no nose—only a high, bony ridge, looking down into a brainless hollow. The mouth was merely a distorted, three-cornered hole, and the incisors had fallen down the yawning throat. But the chin was there as in life, thin and aggressive, with an unwholesome brown stubble on it yet, that looked wonderfully like the Titian in the Museo. The gay pleasure-party went up the latter in groups, and came down rather silent and thoughtful. The scintillant remark that emperors are but men, after all, was made in all the modern languages—for diplomats are never wasteful of wit.

They then moved off in a pensive procession to the toy-house of Charles IV., "whose preciousnesses," says the court journal, again becoming communicative, "they observed with attention, regaling themselves with an exquisite punch." They took the evening train for Madrid, loud in their praises of the delicate courtesy of Mr. Sagasta. This keen and witty intrigant doubtless remembered the story of the Cid, who won his last battle the day after his death, strapped upright in his saddle, and must have thought how much more of majesty there would be in the imperial mummy of the Escorial, throned in the Palace of the Orient, than in any live princeling now open to a royal engagement.

Poor Humanity.

More than half a century since, the following lines were found in the Royal College of Surgeons, London, beside a skeleton remarkable for its symmetry of form. They were subsequently published in the London Morning Chronicle, and a vain effort made to ascertain the author, even to the offering of a reward of fifty guineas:

Behold this ruin! 'Twas a skull
Once of ethereal spirit full.
This narrow cell was life's retreat;
This space was thought's mysterious seat.
What beauteous visions filled this spot
With dreams of pleasure long forgot!
Nor, hope, nor joy, nor love, nor fear,
Have left one trace of record here!

Beneath this mouldering canopy,
Once shone the bright and busy eye;
But start not at the dismal void!
If social love that eye employed;
If with no lawless fire it gleamed;
But through the dews of kindness beamed;
That eye shall be forever bright,
When sun and stars are sunk in night.

Within this hollow cavern hung
The ready, swift, and tuneful tongue;
If falsehood's honey it disdained,
And when it could not praise, was chained;
If bold in Virtue's cause it spoke,
Yet gentle concord never broke;
The silent tongue shall plead for thee,
When time unveils eternity.

Say, did these fingers delve the mine,
Or with the envied ruby shine?
To hew the rock, or wear the gem,
Can little now avail to them.
But if the page of truth they sought,
Or comfort to the mourner brought—
These hands a richer meed shall claim
Than all that wait on wealth or fame.

Avails it, whether bare or shod,
These feet the paths of duty trod?
If from the bowers of ease they fled,
To seek affliction's humble shed;
If grandeur's guilty bribe they spurned,
And home to virtue's cot returned—
These feet with angels' wings shall vie,
And tread the palace of the sky.

Kaiteur Water-fall, Demerara.

The great Kaiteur Fall, recently discovered by Mr. Brown, has a clear descent, according to barometrical observations, taken simultaneously by Mr. Brown at the bottom, and by Mr. Mitchell at the top, of seven hundred and fifty feet. Above, the Potaro glides smoothly in a slight depression of the table of conglomerate sandstone, and disappears over the edge in a body which is estimated at eighty yards in width, and of depth uncertain in the centre, but shallowing rapidly toward either bank. When the fall was discovered, in April, 1870, the rocky channel was completely covered, and the stream must have had a width of at least one hundred yards. During the summer it diminishes in volume, and the Indians state that it continues to do so till October, when only the central and deeper portion, about one-third of the whole, remains. The best time, therefore, for a visit is in spring, at the end of what appears to be the rainy season of this elevated tract.

As the fall was seen by the exploring party who discovered it, nothing can be imagined more beautiful. The central portion, which is never dry, forms a small horseshoe, or re-entering angle, and the water in this part preserves its consistency for a short distance from the edge. But everywhere else, and here also at a few feet from the top, all semblance of water disappears; it breaks up, or blossoms, into fine foam or spray, which descends in the well-known rocket-like forms of the Staubbach and similar water-falls, but multiplied a thousand times, into a small dark pool, over a semicircular curtain. The cavern behind the fall is the home of thousands of swallows, which issue from it in the morning, and may be seen returning in their multitude at night. The fall itself is one vast descending column of a fine, dry-looking, snow-white substance, bearing a resemblance in color and consistency to the snow of an avalanche, but surpassing all avalanches in size and in the beauty of the forms taken by the material as it falls. Rainbows of great splendor were observed, one from the front of the fall in the morning, one from the summit in the afternoon; but this last reverted, forming a colored loop or ring, into which the whole mass seemed to precipitate itself, and disappear and dart out underneath, black and foaming at the gorge and outlet of the pool.

The Land of Flowers.

Florida—by far the largest and most accessible of our Atlantic States, the first among them to be settled by Europeans—remains to this day the most sparsely peopled. With a coast line of over five hundred miles on the Atlantic, and over six hundred on the Mexican Gulf, with several good harbors, and considerable inland navigation, she has hardly more inhabitants than square miles. Yet her natural attractions are certainly considerable. Her climate is semitropical, yet not excessively hot, being modified by breezes from the ocean and the gulf. Her timber is more abundant and accessible than that of any other State, while game and fish are nowhere else so abundant. Her soil is of unequal value, but much of it is decidedly fertile. It is too soon by many years to talk of draining her rich

swamps; but very much of what seems to a casual view but white sand is really composed of minute marine shells, and produces large crops at a moderate cost. For the growth of fruits, she cannot be surpassed. Oranges of fine quality are produced in great abundance and at a good profit, though frost sometimes destroys fruit and tree together. Lemons, limes, peaches, figs, grapes, pomegranates, olives, blackberries, thrive admirably. Horned cattle, sheep, and swine, thrive and multiply on the wild grasses with little feeding and less care. Very large herds of cattle have cost their owners little besides the trouble of marking the calves so that they may be identified. Some raisers have each twenty-five thousand head or thereabout, and are rapidly enriching themselves by pasturing stock on everybody's land. The Confederate armies were largely supplied with beef from these magnificent herds. Whenever Florida shall be systematically cultivated, even in part, her cultivators will derive great advantage from the early maturing of their crops. Berries, fruits, vegetables, will be sent by daily lines of steamers to every great seaboard city months before those of the North will be ready for market. New potatoes in May, and fresh grapes in July, will command prices far exceeding those paid three months afterward.

The Fountain of Tears.

If you go over desert and mountain,
Far into the country of sorrow,
To-day and to-night and to-morrow,
And maybe for months and for years,
You shall come, with a heart that is bursting
For trouble and toiling and thirsting,
You shall certainly come to the fountain
At length—to the Fountain of Tears.

Very peaceful the place is, and solely
For piteous lamenting and sighing,
And those who come living or dying
Alike from their hopes and their fears;
Full of cypress-like shadows the place is,
And statues that cover their faces;
But out of the gloom springs the holy
And beautiful Fountain of Tears.

And it flows and it flows with a motion,
So gently and lovely and listless,
And murmurs a tune restless
To him who hath suffered and hears—
You shall surely, without a word spoken,
Kneel down there and know your heart
broken,
And yield to the long-curbed emotion
That day by the Fountain of Tears.

You may feel, when a falling leaf brushes
Your face, as though some one had kissed
you;
Or think at least some one who missed you
Hath sent you a thought—if that cheers;
Or a bird's little song, faint and broken,
May pass for a tender word spoken:
Enough, while around you there rushes
That life-drowning torrent of tears.

And the tears shall flow faster and faster,
Brim over, and baffle resistance,
And roll down bleared roads to each dis-
tance
Of past desolation and years,
Till they cover the place of each sorrow,
And leave you no past and no morrow:
For what man is able to master
And stem the great Fountain of Tears?

The New-York Cathedral.

The great Roman Catholic cathedral, covering the entire block between Fifth and Madison Avenues, and Fiftieth and Fifty-first Streets, is rearing its vast proportions above the ground-

level with increased rapidity. The entire area of ground occupied by the edifice proper is one and a half acres. In natural symbolism, the church "is founded upon a rock," the primeval strata backbone of Manhattan Island; very slight excavations were made to reach it. The huge enterprise, commenced a number of years ago, during the lifetime of the late Archbishop Hughes, is now progressing toward completion as rapidly as circumstances will admit, under the direction of Archbishop McCloskey. The time estimated as necessary to finish the work is about twenty years. At present considerably over one hundred men are employed in quarrying, stone-cutting, masonry, and general labor. The marble used is quarried at Pleasantville, on the Harlem Railroad, and is brought directly on the premises by a special branch track. It is of the very best quality for building purposes, being of fine, large crystals, of an even consistency and uniform color. Some of the blocks are very heavy, weighing from ten to fifteen tons each. The progress of operations during the past summer season has been much more rapid than previously. An additional number of mechanics are to be employed during the winter in the carving and trimming of stone. The walls have now reached a height of fifty-four feet to the triforium, and are ready to receive the cornices and parapet.

A Voice of the Time.

By FRANCES BROWN.

By Folkheim's bending vines and corn

The broad Rhine rolls over silvery sands,
And there in his porch at early morn

Old Franz, the mayor of the village, stands.

A shepherd youth draws quickly near,

"Good master Franz, if you know it, say,

What sound is that in the east I hear,

Like thunder, hollow, and far away?"

"God keep it far from our village, boy!

That sound, nigh sixty years ago,

Made me and mine from our dwelling fly

To the wintry woods and the drifting snow.

It made my grandsire rise and flee

From ripened fields in the harvest days,

And pause on the mountain-side to see

His village and land in one wide blaze.

"Thus, through our luckless generations,

Have armies burst on the land like waves,

And left behind but their desolations,

The ruined homes, and the battle-graves.

It was now for a statesman's cherished scheme,

And then for a prince's power or pride,

But ever the reckoning read the same,

The cannon roared and the thousands died.

"Oh, storied Rhine, if all the blood

Poured forth on thy fair banks could appear,

Since first there met by thy silvern flood

The Roman sword and the Teuton spear,

That crimson wave should far outflow

Thine own by the summer sun set free

From the hoary heights of the Alpine snow

To the sandy bays of the Northern Sea.

"And now in old Europe's thoughtful days,

Is this what her boasted knowledge brings?

With tomes and teachers in all our ways,

Has the world never a school for kings?

Nor yet for nations, whose praise attends

The statesman's craft and the conqueror's crime,

Whose skill is taxed and whose science bends

To serve destruction from clime to clime?

"Oh, men whom Nature has made brothers,

In wants and perils, in hopes, and fears,

Who at the knees of Christian mothers

Have prayed in your tender, loving years—

Is there no dear remembered truth

Left in your hearts from that better day;

No voice of wisdom, no thought of ruth,

That yet forbids you to waste and slay?

"Must you be still the spoil or sport,

The ready tools to the victims blind,

Of those that in cabinet and court

Sit plotting treason against mankind?

Have your best and your wisest hoped in vain

For the promised time when strife shall cease,

And nations rest in the glorious reign

Of Him whose name is the Prince of Peace?"

Professional Life in New York.

The number of lawyers in New York is variously estimated from four to seven thousand. It is sometimes said that there is one lawyer to every hundred inhabitants; if so, how can they live? One of the first counsellors of the city said to us, a few days ago, "There are about four thousand lawyers in the city; five hundred of these do all the important business; and the most lucrative cases are confined to fifty of these." If this be true, and there is little reason to doubt it, why do so many students enter the legal profession? The answer given here is, that law requires little capital. No young man can now begin business, as a merchant, unless he is wealthy. A man needs a small fortune to be able to rent one room on Broadway. A young lawyer can make business if he is enterprising and popular in manners. Most business men employ attorneys to make all such papers as country merchants write for themselves. The sale of real estate employs many lawyers in looking up titles and making deeds. Still, it is very difficult for a young practitioner to earn, for some years, more than a meagre support for himself; he cannot enter into family relations. The effect of such a life is patent to all.

The physicians rank next to the lawyers in numbers; but they hardly amount to more than a thousand. They fall more readily into practice than lawyers; still only one in a hundred becomes widely known; very few become rich from their professional income. The ministers are last, but not least, in this enumeration. We do not know the number of churches in New York; but we suppose they cannot exceed four hundred. These are but partially filled on the Sabbath. A few eminent preachers, ten perhaps, have crowded houses; the rest preach to two or three hundred hearers. We have been told that about one in ten of the population attend church. The sabbath is becoming a day of amusement. Citizens visit the park more on that day than on any other. Pleasure and recreation are more earnestly sought, at all times, than spiritual culture. The ministers, therefore, have a hard field of labor; but it is quite as respectable, and, probably, more remunerative, than the professions of law and medicine.

Close Stoves.

Of all the nuisances in the shape of modern economical inventions, one of the most unmitigated, in our opinion, is the dark, mirth-dispelling, jail-resembling, close stove. Doubtless they economize fuel at the expense of health; but we never attempt to infuse vital warmth into our shivering frame by one of these gloomy iron boxes, but we wish these deadly foes to cheerfulness, and their inventors with them, were sunk at the bottom of the Atlantic. If wood were forty dollars a cord instead of eight, or coal fifty dollars a ton instead of ten, we would burn it in an open fireplace. We would rather freeze, even, in view of a generous, blazing, roaring open fire, than undergo

the gradual thaw effected by a cheerless, blue-imparting, suffocating iron stove. True, this invention affords a cheap means of dispelling the cold; but who at evening has not marked the difference between the cheerless warmth of heated iron, and the rich, generous, comfortable, and all-pervading temperature which steals through the frame when the ruddy open fire sends its dancing flames across the snug sitting-room—when the red embers blaze and glow with a tempting spell that charms you to the hearth; when, if there be a friend present, you pour out your whole soul in a flood of unbidden confidence, and only tear yourself away at twelve, "the very witching time o' night," when the clock, with a single quivering peal, startles you from your tranquil and delicious reveries?

We believe there is not a more common source of contamination to the air of our dwellings, school-houses, and churches, than the almost universal use of stoves. Heated iron not only absorbs rapidly the oxygen so necessary to the lungs, but at the same time exhales a deleterious suffocating effluvia. Hence the severe headache to which almost every one is subject who respire the atmosphere in the vicinity of a heated iron stove. When the laws of human posture are reversed, and men stand on their heads instead of their feet, then will air-tight stoves, *et id genus omne*, which now heat the former and cool the latter, answer in a very small degree the purposes for which they were designed. The pain in the brain, which they now almost universally cause, proceeds from the want of a sufficient oxygenation of the blood in the lungs. It is said that a similar effect has been produced on quadrupeds, by causing venous instead of arterial blood to pass into the head. Besides all these formidable objections to the close iron stove, there are the further ones, that it produces, as generally managed, a very uneven temperature, and a much higher degree of heat than is healthful.—*Western Monthly*.

The Moabite Stone.

This curious relic of antiquity was the subject of a paper recently read in the department of Ethnology and Anthropology of the British Association. The author of the paper, Rev. C. D. Guisbert, says that this stone dates back nine hundred years before Christ, and that the inscriptions are more ancient than two-thirds of the Old-Testament books. Out of fifteen Moabite cities mentioned in the Old Testament, the names of eleven are to be found on the stone. From the inscriptions, Dr. Guisbert has arrived at the conclusions that the Moabites had attained a high degree of civilization, and were superior to the Israelites in military ability. He was also of the opinion that our alphabet was derived, through the Greeks and Romans, from the Moabites. He also contended that, at the period indicated by the inscriptions, an organized temple service existed among the Israelites living out of Palestine, and that the service was analogous to that of the Moabites. He also stated that the word "Jehovah" was in common use among the Israelites nine hundred years before Christ, although afterward it was considered too sacred to be named. Dr. Rawlinson, in the discussion that followed, objected to the conclusions of the paper, and attributed to the Phenicians the merit of the discoveries claimed for the Moabites.

Castles.

Types of architecture have sometimes a curious connection with epochs in history. The castle was essentially the device of the Norman. It has been remarked that it united three func-

tions generally separated. It was a fortress, a prison, and a domestic dwelling-house—not merely a place where a garrison ate and slept, but a luxurious mansion according to the available luxury of the day. These buildings were thus peculiar to the countries swept by Norman power, or inhabited by kindred populations taking their habits from the Normans. Pasquiar tells us that the reason for saying in derision of a boastful fellow that he has a *château en Espagne*, is because there are no chateaus in Espagne. The country was in the hands of the Moors when the Normans were consolidating their influence over the rest of Europe. The date when this influence began in each district, whether by invasion or otherwise, coincides curiously with that of the style of castle-building. England's oldest castles are the round-arched Norman of the Conqueror's period. Those of Scotland, Ireland, and Wales, go back no farther than Edward I.—*Blackwood*.

Varieties.

THE Winston (N. C.) *Sentinel* tells of the following two very singular cases of sudden death: "Salathiel Hier, a citizen living in the southern portion of the county, was taken sick, and a few days ago was visited by his neighbor, Alfred Gimble. Mr. Gimble was standing by the bedside, holding him by the hand. He asked him how he was getting along. Hier told him he thought he was going to die. Gimble remarked that we all had to die some time. Almost before the sentence was finished he dropped dead, with Hier's hand clasped in his, nearly pulling him out of bed. Hier was so frightened and excited by the circumstance that he died in a short time."

Two lawyers, when a knotty case was o'er, Shook hands, and were as friendly as before; "Zounds!" said the client, "I would fain know how You can be friends who were such foes just now?" "Thou fool!" said one, "we lawyers, though so keen, Like shears, ne'er cut ourselves, but what's between."

A wealthy bachelor, having had one or two lawsuits for breach of promise, now replies to any young lady who wishes a few minutes' private conversation, "No, you do not, madam. It cuts me to the heart to be compelled to doubt the honorableness of your intentions, but that sort of thing is played out. My rule is imperative, and, if you have any business with me, it must be transacted in the presence of two witnesses!"

Paris is about eight miles in diameter, and the Prussian "target," Notre-Dame, is in the heart of the city, four miles from the nearest fortified wall. The circle of forts without these fortifications are from two to five miles farther off, and the Prussian lines are from five to eight miles from the forts. These facts explain why the besieging army do not bombard Paris, and why Notre-Dame is not so good a target as Strasbourg Cathedral.

Mr. Kirkcup, an English artist and an ardent spiritualist, is in the habit of holding daily intercourse with Dante, who, he informs us, "is a little vain of his personal appearance." His costume was formerly of the orthodox color, but, having been promoted to a higher spiritual rank, he now floats in a garb of blue, rose-color, and green, and is "very well satisfied with the change."

Mexico seems, at last, to have entered on the road of progress. Schools and free libraries are multiplying and improving; reformatory penitentiaries are taking the place of the barbarous old jails; the highways and bridges are greatly bettered; telegraphs are branching all over the country; and there are several important railroad enterprises under way.

James Brabazon Pilkington has been undergoing a series of trials in Ceylon, and been

twice condemned as a raving maniac, on the sole ground that, in a casual quarrel with Sir Hercules Robinson, governor of the island, he shook his fist in that mighty man's face and called him a brute. However, by a vigorous fight, he was at last freed.

A Quaker Indian agent, who has recently visited the Cherokees, Choctaws, and other tribes, gives it as his opinion that the Indian females can be elevated, and adds that "hoop-skirts are more useful in a family than war-whoops."

In 1830 the United States had forty-one miles of railroad. In 1870 the United States had fifty thousand miles of railroad. Ohio has nearly four thousand miles—more than any other State except Pennsylvania and Illinois.

For over thirty years an old gentleman at St. Albans, Vermont, has made a practice of getting out of bed every night at eleven, twelve, two, and four o'clock, to enjoy a comfortable smoke.

A poet asked a friend what he thought of his last production, "An Ode to Sleep." "You have done such justice to the subject that it is impossible to read it without feeling its whole weight," was the reply.

Three of the students at the Troy Academy are sons of Japanese nobles. They were brought there under the auspices of the Dutch Reformed Church, but reserve the privilege of paying their own expenses.

It must have been consoling for sick soldiers on low diet in the military hospitals during the late war to sing, "When this cruel war is over, we shall meet again."

The *Springfield Republican* is of the opinion that in New England the lyceum has had its day, and that people are beginning to conclude they have been lectured enough.

The difference between a bouquet of flowers and the "bouquet" of wine is, that one makes a nosegay, while the other makes a gay nose.

A contemporary proposes the establishment of "training colleges," wherein young women may be taught how to rear infants according to the latest lights of medical and social science.

A convention was held in Oregon lately to devise means for elevating the Indians of the Pacific coast. On the eastern reservations whiskey is found to be very effective.

Politeness is like an air-cushion—there may be nothing in it, but it eases our jolts wonderfully.

Dr. Doddridge's prescription for the hour—"Forget the steps already trod, and onward urge thy way."

At the battle of Gravelotte a trumpeter was killed by a ball which went in at the mouth of his instrument.

In a bookseller's catalogue appears the following article: "Memoirs of Charles I., with a head capitally executed."

Several of the large Australian establishments are said each to can one thousand sheep daily.

One-sixth of the female population of England work out-of-doors.

General Trochu is said to be descended from Racine.

There are seventy-four thousand doctors in the United States.

In Colorado there are many men of many mines.

A bad place to get out at—the elbow.

A bad omen—to owe men money.

A grate nuisance—bad coal.

The Museum.

IN our geological illustrations we now reach the Pliocene period, the third and con-

cluding subdivision of the Tertiary epoch. This period was marked in some parts of Europe by great movements of the terrestrial crust, always due to the same cause, namely, the continual and gradual cooling of the globe. This cooling, during which the outer zone of the fluid mass passed to the solid state, produced irregularities and inequalities in the external surface, sometimes accompanied by fractures through which the semifluid or pasty matter poured itself, leading afterward to the upheaval of mountain-ranges through these gaping chasms. Thus, during the Pliocene period, many mountains and mountain-chains were formed in Europe by basaltic and volcanic eruptions. These upheavals were preceded by sudden and irregular movements of the elastic mass of the soil—by earthquakes, in short. M. Lecoq says: "Arrived, finally, at the last period which preceded our own epoch—the epoch in which the temperate zones were still embellished by tropical forms of vegetation, which were, however, slowly declining, driven out, as it were, by a cooling climate, and by the invasion of more vigorous species—great terrestrial commotions took place: mountains are covered with eternal snow; continents now take their actual forms; but many great lakes, now dried up, still existed; great rivers flowed majestically through smiling countries, whose surface man had not yet come to modify." There is strong presumptive proof that in this period the greater part of the European area, including the Alps and the Apennines, emerged from the deep. In Sicily, Newer-Pliocene rocks, covering nearly half the surface of the island, have been raised from two to three thousand feet above the level of the sea. Fossil shells have been observed at the height of eight thousand feet in the Pyrenees; and, as if to fix the date of upheaval, there are great masses of granite which have penetrated the lias and the chalk. Fossil shells of the period are also found at a height of ten thousand feet in the Alps, at thirteen thousand in the Andes, and at eighteen thousand in the Himalayas.

The terrestrial animals of the Pliocene period present us with a great number of creatures alike remarkable from their proportions and from their structure. The mastodon, which makes its first appearance in the Miocene formation, continues to be found, but becomes extinct apparently before we reach the upper beds. Other mammals present themselves of genera totally unknown till now; some of them, such as the hippopotamus, the camel, the horse, the ox, and the deer, surviving to the present age. The fossil horse, of all animals, is perhaps that which presents the greatest resemblance to existing individuals; but it was small, not exceeding the ass in size.

The rhinoceros, which made its appearance in the preceding period, appears in great numbers during this epoch. Of all fossil ruminants, perhaps the largest, and certainly not the least curious, is the Sivatherium, whose remains have been found in India, in the Sewalik Hills, one of the spurs of the Himalayas. Its name is taken from that of Siva, the Indian deity worshipped in that part of India. It was about the size of the elephant; it belonged to the deer tribe, and was probably the most gigantic species that ever existed. It somewhat resembled the existing elk, but was much larger and more massive. The head presented an arrangement which has not been observed in any other animal known; it carried four horns, two rising above the forehead in broad tines, and the two others, of larger size, projected forward from above the eyes. These four horns were very divergent, and calculated to give this colossal stag a very strange aspect.

The birds of this period were very numerous, | vultures, eagles, gulls, swallows, pheasants, | animals, and remains of the whale are found
and of many species which still exist—such as | etc. The dolphin appears among the marine | differing very little from those now living.

HARVEY FISK.

A. S. HATCH.

FISK & HATCH, BANKERS AND DEALERS IN GOVERNMENT SECURITIES,

No. 5 NASSAU STREET, NEW YORK, Jan. 2, 1871.

The subjoined table will show the gross earnings and operating expenses of the main line of the CENTRAL PACIFIC RAILROAD (Salt Lake to San Francisco), and the number of miles operated in each year, from the commencement to the present time:

Miles Operated.	Gross Earnings.	Operating Expenses.
1865..... 31 to 56	\$401,941.92	\$121,669.53
1866..... 56 to 94	864,917.57	200,710.61
1867..... 94 to 137	1,470,653.50	330,913.33
1868..... 137 to 468	2,300,767.17	843,066.54
1869..... 468 to 742	5,670,822.25	2,993,523.19
1870..... 742 to 900	7,920,710.98	4,060,564.95
Total.....	\$18,629,813.39	\$8,550,548.15

The following will show the aggregate net earnings, interest liabilities, and surplus earnings for the same period:

Net Earnings.	Interest on Outstand- ing Bonded Debt.	Surplus of Net Earn- ings over Interest.
\$10,079,265	\$4,184,221	\$5,895,042

From the foregoing tables it will be seen that the Central Pacific Railroad has earned, in six years, more than \$10,000,000 net over operating expenses, and nearly \$6,000,000 over operating expenses and interest on its bonds; while, during four years and a half of that time, the road was under construction, without through business, and, for the first three years, with less than 100 miles in operation.

Of the earnings for 1870, at least 65 per cent. was from local business. The security of the principal, and the assurance of regular and prompt payment of interest, which are afforded in the valuable property and immense revenue of the road, render the Central Pacific bonds as safe and reliable an investment as can be made. They are duly quoted on the regular call of the New York Stock Exchange, and of several of the most important Stock Exchanges of Europe, and can be as readily sold at quoted market price as the bonds of the United States Government.

We buy and sell Government Bonds, Gold, etc., make collections, receive deposits, allow interest thereon, and do a general Banking business.

["RALPH THE HEIR," SUPPLEMENT No. XV.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF JANUARY 21.]

A Meeting in the Conservative Interest.—Chapter XXXIX.

CHAPTER XLII.

NOT BROKEN-HEARTED.

CHRISTMAS had come and gone at Newton Priory, and the late squire's son had left the place—protesting as he did so that he left it forever. To him also life in that particular spot of earth was impossible, unless he could live there as lord and master of all. Everybody throughout that and neighboring parishes treated him not only with kindness, but with the warmest affection. The gentry, the farmers, and the laborers, all men who had known him in the hunting-field, in markets, on the bench, or at church, men, women, and children, joined together in forming plans by means of which he could remain at Newton. The young squire asked him to make the house his home, at any rate for the hunting-season. The parson offered half the parsonage. His friend Morris, who was a bachelor, suggested a joint home and joint stables between them. But it was all of no avail. Had it not been for the success which had so nearly crowned the late squire's efforts during the last six months, it might have been that his friends should have prevailed

with him. But he had been too near being the master to be able to live at Newton in any other capacity. The tenants had been told that they were to be his tenants. The servants had been told that they were to be his servants. During a few short weeks, he had almost been master, so absolute had been the determination of the old squire to show to all around him that his son, in spite of the blot upon the young man's birth, was now the heir in all things, and possessed of every privilege which would attach itself to an elder son. He himself while his father lived had taken these things calmly, had shown no elation, had even striven to moderate the vehemence of his father's efforts on his behalf; but not the less had he been conscious of the value of what was being done for him. To be the promised future owner of the acres on which he had lived, of the coverts through which he had ridden, of every tree and bank which he had known from his boyhood, had been to him a source of gratified pride not the less strong because he had concealed it. The disappointment did hit him sorely. His dreams had been of Parliament, of power in the county, of pride of place, and popularity. He now found that

they were to be no more than dreams—but with this additional sorrow, that all around him knew that they had been dreamed. No—he could not stay at Newton even for the sake of living with friends who loved him so dearly. He said little or nothing of this to any one. Not even to Gregory Newton or to his friend Morris did he tell much of his feeling. He was not proud of his dreamings, and it seemed to himself that his punishment was just. Nor could he speak to either of them or to any man of his past ambition, or of what hopes might remain to him in reference to Mary Bonner. The young squire had gone forth with the express purpose of wooing her, had declared his purpose of doing so, and had returned to Newton at any rate without any ready tale of triumph on his tongue. What had been his fortune the rival would not ask; and while the two remained together at the priory no further word was spoken of Mary Bonner. He, Ralph the dispossessed one, while he believed himself to be the heir, had intended to bring her home as a fitting queen to share his throne. It might be that she would consent to be his without a throne to share; but in thinking of her he could not but remember what his ambition had been,

and he could hardly bring himself now to offer to her that which was comparatively so little worth the having. To suppose that she should already "be fond of him," should already long for him as he longed for her, was contrary to his nature. Hitherto when he had been in her presence, he had stood there as a man whose position in life was almost contemptible; and though it would be unjust to him to say that he had hoped to win her by his acres, still he had felt that his father's success on his behalf might justify him in that which would otherwise be unjustifiable. For the present, however, he could take no steps in that direction. He could only suggest to himself what had already been her answer, or what at some future time might be the answer she would make to his rival. He had lost a father between whom and himself there had existed ties, not only of tender love, but of perfect friendship, and for a while he must bewail his loss. That he could not bewail his lost father without thinking of his lost property, and of the bride that had never been won, was an agony to his soul.

He had found a farm down in Norfolk, near to Swaffham, which he could take for twelve months, with the option of purchase at the expiration of that time, and thither he betook himself. There were about four hundred acres, and the place was within his means. He did not think it likely that Mary Bonner would choose to come and live upon a Norfolk farm; and yet what other work in life was there for which he was fit? Early in January he went down to Beamingham Hall, as the place was called, and there we will leave him for the present, consoling himself with oil-cake, and endeavoring to take a pride in a long row of stall-fed cattle.

At this time the two brothers were living at Newton Priory. Ralph the heir had bought some of his uncle's horses, and had commenced hunting with the hounds around him; though he had not as yet withdrawn his stud from the Moonbeam. He was not altogether at his ease, as he had before the end of February received three or four letters from Neeft, all of them dictated by Waddle, in which his conduct was painted not in the most flattering colors. Neeft's money had been repaid, but Neeft would not understand that the young heir's obligations to him had by any means been acquitted by that very ordinary process. He had risked his money when payment was very doubtful, and now he intended to have something beyond cash in return for all that he had done. "There are debts of honor which a real gentleman feels himself more bound to pay than any bills," Waddle had written. And to such dogmatic teachings as these Neeft would always add something out of his own head. "There ain't nobody who shan't know all about it, unless you're on the square again." Ralph had written one reply since he had been at Newton, in which he explained at some length that it was impossible that he should renew his addresses to a young lady who had twice rejected them, and who had assured him that she did not love him. He professed the

greatest respect for Miss Neeft, a respect which had, if possible, been heightened by her behavior in this matter—but it must now be understood that the whole affair was at an end. Neeft would not understand this, but Neeft's further letters, which had not been unfrequent, were left unanswered. Ralph had now told the whole story to his brother, and had written his one reply from Newton in conformity with his brother's advice. After that they both thought that no further rejoinder could be of any service.

The parsonage was for the time deserted, Gregory having for the present consented to share his brother's house. In spite of that little thorn in the flesh which Neeft was, Ralph was able to enjoy his life very thoroughly. He went on with all the improvements about the place which the squire had commenced, and was active in making acquaintance with every one who lived upon his land. He was not without good instincts, and understood thoroughly that respectability had many more attractions than a character for evil living. He was, too, easily amenable to influence from those around him; and, under Gregory's auspices, was constant at his parish church. He told himself at once that he had many duties to perform, and he attempted to perform them. He did not ask Lieutenant Cox or Captain Fooks to the Priory, and quite prepared himself for the character of Henry V. in miniature, as he walked about his park, and rode about his farms, and talked with the wealthier farmers on hunting mornings. He had a full conception of his own dignity, and some not altogether inaccurate idea of the manner in which it would become him to sustain it. He was, perhaps, a little too self-conscious, and overinclined to suppose that people were regarding his conduct because he was Newton of Newton—Newton of Newton with no blot on his shield, by right of his birth, and subject to no man's reproach.

He had failed grievously in one matter on which he had set his heart; but as to that he was, as the reader knows, resolved to try again. He had declared his passion to the other Ralph, but his rival had not made the confidence mutual. But hitherto he had said nothing on the subject to his brother. He had put it by, as it were, out of his mind for a while, resolving that it should not trouble him immediately, in the middle of his new joys. It was a thing that would keep—a thing, at any rate, that need not overshadow him night and morning. When Neeft continued to disturb him with threats of publicity in regard to Polly's wrongs, he did tell himself that in no way could he so effectually quiet Mr. Neeft as by marrying somebody else, and that he would, at some very early date, have recourse to this measure; but, in the mean time, he would enjoy himself without letting his unrequited passion lie too heavily as a burden on his heart. So he ate and drank, and rode and prayed, and sat with his brother magistrates on the bench, and never ceased to think of his good fortune, in

that he had escaped from the troubles of his youth, unscathed and ungraded.

Then there came a further letter from Mr. Neeft, from which there arose some increase of confidence among the brothers. There was nothing special in this letter. These letters, indeed, were very like to each other, and, as had now come to be observed, were always received on a Tuesday morning. It was manifest to them that Neeft spent the leisure hours of his Sundays in meditating upon the hardness of his position; and that, as every Monday morning came, he caused a new letter to be written. On this particular Tuesday, Ralph had left home before the post had come, and did not get the breeches-maker's epistle till his return from hunting. He chucked it across the table to Gregory when he came down to dinner, and the parson read it. There was no new attack in it, and, as the servant was in the room, nothing was then said about it. But after dinner the subject was discussed.

"I wish I knew how to stop the fellow's mouth," said the elder brother.

"I think I should get Carey to see him," suggested Gregory. "He would understand a lawyer when he was told that nothing could come of it but trouble to himself and his daughter."

"She has no hand in it, you know."

"But it must injure her."

"One would think so. But she is a girl whom nothing can injure. You can't imagine how good and how great she is—great in her way, that is. She is as steady as a rock, and nobody who knows her will ever imagine her to be a party to her father's folly. She may pick and choose a husband any day she pleases. And the men about her won't mind this kind of thing as we should. No doubt all their friends joke him about it, but no one will think of blaming Polly."

"It can't do her any good," said Gregory.

"It cannot do her any harm. She has a strength of her own that even her father can't lessen."

"All the same, I wish there were an end of it."

"So do I, for my own sake," said Ralph. As he spoke he filled his glass, and passed the bottle, and then was silent for a few moments. "Neeft did help me," he continued. "and I don't want to speak against him; but he is the most pig-headed old fool that ever existed. Nothing will stop him but Polly's marriage, or mine."

"I suppose you will marry soon now. You ought to be married," said Gregory, in a melancholy tone, in which was told something of the disappointment of his own passion.

"Well—yes. I believe I might as well tell you a little secret, Greg."

"I suppose I can guess it," said Gregory, with still a deeper sound of woe.

"I don't think you can. It is quite possible you may, however. You know Mary Bonner—don't you?"

The cloud upon the parson's brow was at once lightened. "No," said he. "I have heard of her, of course."

"You have never seen Mary Bonner?"

"I have not been up in town since she came. What should take me up? And if I were there, I doubt whether I should go out to Fulham. What is the use of going?" But still, though he spoke thus, there was something less of melancholy in his voice than when he had first spoken. Ralph did not immediately go on with his story, and his brother now asked a question. "But what of Mary Bonner? Is she to be the future mistress of the Priory?"

"God only knows."

"But you mean to ask her?"

"I have asked her."

"And you are engaged?"

"By no means. I wish I were. You haven't seen her, but I suppose you have heard of her?"

"Ralph spoke of her—and told me that she was very lovely."

"Upon my word, I don't think that even in a picture I ever saw any thing approaching to her beauty. You've seen that thing at Dresden. She is more like that than any thing I know. She seems almost too grand for a fellow to speak to, and yet she looks as if she didn't know it. I don't think she does know it." Gregory said not a word, but looked at his brother, listening. "But, by George! there's a dignity about her, a sort of self-possession, a kind of *noli me tangere*, you understand, which makes a man almost afraid to come near her. She hasn't sixpence in the world."

"That needn't signify to you now."

"Not in the least. I only just mention it to explain. And her father was nobody in particular—some old general who used to wear a cocked hat and keep the niggers down out in one of the colonies. She herself talked of coming home here to be a governess—by Jove! yes, a governess. Well, to look at her, you'd think she was born a countess in her own right."

"Is she so proud?"

"No—it's not that. I don't know what it is. It's the way her head is put on. Upon my word, to see her turn her neck is the grandest thing in the world. I never saw any thing like it. I don't know that she's proud by nature—though she has got a dash of that too. Don't you know there are some horses show their breeding at a glance? I don't suppose they feel it themselves; but there it is on them, like the Hall-mark on silver. I don't know whether you can understand a man being proud of his wife."

"Indeed I can."

"I don't mean of her personal qualities, but of the outside get up. Some men are proud of their wives' clothes, or their jewels, or their false hair. With Mary nothing of that sort could have any effect; but to see her step, or move her head, or lift her arm, is enough to make a man feel—feel that she beats every other woman in the world by chalks."

"And she is to be mistress here?"

"Indeed she should—to-morrow, if she'd come."

"You did ask her?"

"Yes—I asked her."

"And what did she say?"

"Nothing that I cared to hear. She had just been told all this accursed story about Polly Neefit. I'll never forgive Sir Thomas—never." The reader will be pleased to re-

member that Sir Thomas did not mention Miss Neefit's name, or any of the circumstances of the Neefit contract, to his niece.

"He could hardly have wished to set her against you."

"I don't know; but he must have told her. She threw it in my teeth that I ought to marry Polly."

"Then she did not accept you?"

"By George! no—any thing but that. She is one of those women who, as I fancy, never take a man at the first offer. It isn't that they mean to shilly and shally and make a fuss, but there's a sort of majesty about them which instinctively declines to yield itself. Unconsciously they feel something like offence at the suggestion that a man should think enough of himself to ask for such a possession. They come to it, after a time."

"And she will come to it, after a time?"

"I didn't mean to say that. I don't intend, however, to give it up." Ralph paused in his story, considering whether he would tell his brother what Mary had confessed to him as to her affection for some one else, but he resolved, at last, that he would say nothing of that. He had himself put less of confidence in that assertion than he did in her rebuke with reference to the other young woman to whom she chose to consider that he owed himself. It was his nature to think rather of what absolutely concerned himself, than of what related simply to her. "I shan't give her up. That's all I can say," he continued. "I'm not the sort of fellow to give things up readily." It did occur to Gregory at that moment that his brother had not shown much self-confidence on that question of giving up the property. "I'm pretty constant when I've set my mind on a thing. I'm not going to let any woman break my heart for me, but I shall stick to it."

He was not going to let any woman break his heart for him! Gregory, as he heard this, knew that his brother regarded him as a man whose heart was broken, and he could not help asking himself whether or not it was good for a man that he should be able to suffer as he suffered, because a woman was fair and yet not fair for him. That his own heart was broken—broken after the fashion of which his brother was speaking—he was driven to confess to himself. It was not that he should die, or that his existence would be one long continued hour of misery to him. He could eat and drink, and do his duty and enjoy his life. And yet his heart was broken. He could not piece it so that it should be fit for any other woman. He could not teach himself not to long for that one woman who would not love him. The romance of his life had formed itself there, and there it must remain. In all his solitary walks it was of her that he still thought. Of all the bright castles in the air which he still continued to build, she was ever the mistress. And yet he knew that she would never make him happy. He had absolutely resolved that he would not torment her by another request. But he gave himself no praise for his constancy, looking on himself as being somewhat weak in that he could not overcome his longing. When Ralph declared that he would not break his heart, but that, nevertheless, he would stick to the girl, Gregory envied him, not doubting of his success, and believing that it was to men of this calibre that success in love is generally given. "I hope with all my heart that you may win her," he said.

"I must run my chance like another. There's no '*Veni, vidi, vici*,' about it, I can tell you; nor is it likely that there should be with such a girl as Mary Bonner. Fill your glass, old fellow. We needn't sit mumchance because we're thinking of our loves."

"I had thought—" began Gregory very slowly.

"What did you think?"

"I had thought once that you were thinking of—Clarissa."

"What put that into your head?"

"If you had I should never have said a word, nor fancied any wrong. Of course she'll marry some one. And I don't know why I should ever wish that it should not be you."

"But what made you think of it?"

"Well—I did. It was just a word that Patience said in one of her letters."

"What sort of word?" asked Ralph, with much interest.

"It was nothing, you know. I just misunderstood her. When one is always thinking of a thing, every thing turns itself that way. I got it into my head that she meant to hint to me that as you and Clary were fond of each other, I ought to forget it all. I made up my mind that I would—but it is so much easier to make up one's mind than to do it." There came a tear in each eye as he spoke, and he turned his face toward the fire that his brother might not see them. And there they remained hot and oppressive, because he would not raise his hand to rub them away.

"I wonder what it was she said," asked Ralph.

"Oh, nothing. Don't you know how a fellow has fancies?"

"There wasn't any thing in it," said Ralph.

"Oh; of course not."

"Patience might have imagined it," said Ralph. "That's just like such a sister as Patience."

"She's the best woman that ever lived," said Gregory.

"As good as gold," said Ralph. "I don't think, however, I shall very soon forgive Sir Thomas."

"I don't mind saying now that I am glad it is so," said Gregory; "though as regards Clary that seems to be cruel. But I don't think I could have come much here had she become your wife."

"Nothing shall ever separate us, Greg."

"I hope not—but I don't know whether I could have done it. I almost think that I oughtn't to live where I should see her; and I did fear it at one time."

"She'll come to the parsonage yet, old fellow, if you'll stick to her," said Ralph.

"Never," said Gregory. Then that conversation was over.

CHAPTER XLIII.

ONCE MORE.

At the end of February Ralph declared his purpose of returning to the Moonbeam, for the rest of the hunting-season. "I'm not going to be such an ass," he said to his brother, "as to keep two sets of horses going. I bought my uncle's because it seemed to suit just at the time; and there are the others at Horsball's, because I've not had time to settle down yet. I'll go over for March, and take a couple with me; and, at the end of it, I'll get rid of those I don't like. Then that'll be the end of the Moonbeam, as far as I am concerned." So he prepared to start, and on the evening before he went his brother declared that he would go as far as London with him. "That's all right," said Ralph, "but what's taking you up now?" The parson said that he wanted to get a few things, and to have his hair cut. He shouldn't stay above one night. Ralph asked no more questions, and the two brothers went up to London together.

We fear that Patience Underwood may not have been in all respects a discreet preserver of her sister's secrets. But then there is nothing more difficult of attainment than discretion in the preservation of such mysteries. To keep a friend's secret well the

keeper of it should be firmly resolved to act upon it in no way—not even for the advantage of the owner of it. If it be confided to you as a secret that your friend is about to make his maiden speech in the House, you should not even invite your acquaintances to be in their places—not if secrecy be the first object. In all things the knowledge should be to you as though you had it not. Great love is hardly capable of such secrecy as this. In the fulness of her love Patience had allowed her father to learn the secret of poor Clary's heart; and in the fulness of her love she had endeavored to make things smooth at Newton. She had not told the young clergyman that Clarissa had given to his brother that which she could not give to him; but, meaning to do a morsel of service to both of them, if that might be possible, she had said a word or two, with what effect the reader will have seen from the conversation given in the last chapter.

She'll come to the parsonage yet, Ralph had said; and Gregory in one word had implied his assured conviction that any such coming was a thing not to be hoped for—an event not even to be regarded as possible. Nevertheless, he made up his mind that he would go up to London—to have his hair cut. In so making up his mind he did not for a moment believe that it could be of any use to him. He was not quite sure that when in London he would go to Popham Villa. He was quite sure that if he did go to Popham Villa he would make no further offer to Clarissa. He knew that his journey was foolish, simply the result of an uneasy, restless spirit—that it would be better for him to remain in his parish and move about among the old women and bedridden men; but still he went. He would dine at his club, he said, and perhaps he might go down to Fulham on the following morning. And so the brothers parted. Ralph, as a man of property, with many weighty matters on hand, had, of course, much to do. He desired to inspect some agricultural implements, and a new carriage—he had ever so many things to say to Carey, the lawyer, and wanted to order new harnesses for the horses. So he went to his club, and played whist all the afternoon.

Gregory, as soon as he had secured a bed at a quiet inn, walked off to Southampton Buildings. From the direct manner in which this was done, it might have been argued that he had come up to London with the purpose of seeing Sir Thomas; but it was not so. He turned his steps toward the place where Clary's father was generally to be found, because he knew not what else to do. As he went he told himself that he might as well leave it alone; but still he went. Stemm at once told him, with a candor that was almost marvellous, that Sir Thomas was out of town. The hearing of the petition was going on at Pereycross, and Sir Thomas was there, as a matter of course. Stemm seemed to think it rather odd that an educated man, such as was the Rev. Gregory Newton, should have been unaware that the petition against the late election at Pereycross was being carried on at this moment. "We've got Sergeant Burnaby, and little Mr. Joram down, to make a fight of it," said Mr. Stemm; "but, as far as I can learn, they might just as well have remained up in town. It's only sending good money after bad." The young parson hardly expressed that interest in the matter which Stemm had expected, but turned away, thinking whether he had not better have his hair cut at once, and then go home.

But he did go to Popham Villa on the same afternoon, and—such was his fortune—he found Clarissa alone. Since her father had seen her in bed, and spoken to her of what he had called the folly of her love, she had not

again given herself up to the life of a sick-room. She dressed herself and came down to breakfast, of a morning, and then would sit with a needle in her hand till she took her book, and then with a book till she took her needle. She tried to work, and tried to read, and perhaps she did accomplish a little of each. And then, when Patience would tell her that exercise was necessary, she would put on her hat and creep out among the paths. She did make some kind of effort to get over the evil that had come upon her; but still no one could watch her and not know that she was a wounded deer. "Miss Clarissa is at home," said the servant, who well knew that the young clergyman was one of the rejected suitors. There had been hardly a secret in the house in reference to Gregory Newton's love. The two other young ladies, the girl said, had gone to London, but would be home to dinner. Then, with a beating heart, Gregory was ushered into the drawing-room. Clarissa was sitting near the window, with a novel in her lap, having placed herself there with the view of getting what was left of the light of the early spring evening; but she had not read a word for the last quarter of an hour. She was thinking of that word scoundrel, with which her father had spoken of the man she loved. Could it be that he was in truth so bad as that? And, if it were true, would she not take him, scoundrel as he was, if he would come to her? He might be a scoundrel in that one thing, on that one occasion, and yet be good to her. He might repent his scoundrelism, and she certainly would forgive it. Of one thing she was quite sure—he had not looked like a scoundrel when he had given her that assurance on the lawn! And so she thought of young men in general. It was very easy to call a young man a scoundrel, and yet to forgive him all his iniquities when it suited to do so. Young men might get in debt, and gamble, and make love wherever they pleased, and all at once—and yet be forgiven. All these things were very bad. It might be just to call a man a scoundrel because he could not pay his debts, or because he made bets about horses. Young men did a great many things which would be horrid indeed were a girl to do them. Then one papa would call such a man a scoundrel, because he was not wanted to come to the house; while another papa would make him welcome, and give him the best of every thing. Ralph Newton might be a scoundrel; but if so—as Clarissa thought—there were a great many good-looking scoundrels about in the world, as to whom their scoundrelism did very little to injure them in the esteem of all their friends. It was thus that Clarissa was thinking over her own affairs when Gregory Newton was shown into the room.

The greeting on both sides was at first formal and almost cold. Clary had given a little start of surprise, and had then subsided into a most demure mode of answering questions. Yes; papa was at Pereycross. She did not know when he was expected back. Mary and Patience were in London. Yes—she was at home all alone. No; she had not seen Ralph since his uncle's death. The question which elicited this answer had been asked without any design, and Clary endeavored to make her reply without emotion. If she displayed any, Gregory, who had his own affairs upon his mind, did not see it. No—they had not seen the other Mr. Newton as he passed through town. They had all understood that he had been very much disturbed by his father's horrible accident and death. Then Gregory paused in his questions, and Clarissa expressed a hope that there might be no more hunting in the world.

It was very hard work, this conversation,

and Gregory was beginning to think that he had done no good by coming, when on a sudden he struck a chord from whence came a sound of music. "Ralph and I have been living together at the Priory," he said.

"Oh—indeed; yes—I think I heard Patience say that you were at the Priory."

"I suppose I shall not be telling any secret to you in talking about him and your cousin Mary?"

Clarissa felt that she was blushing up to her brow, but she made a great effort to compose herself. "Oh, no," she said, "we all know of it."

"I hope he may be successful," said Gregory.

"I do not know. I cannot tell."

"I never knew a man more thoroughly in love than he is."

"I don't believe it," said Clarissa.

"Don't believe it! Indeed you may, Clary. I have never seen her, but from what he says of her I suppose her to be most beautiful."

"She is—very beautiful." This was said with a strong emphasis.

"And why should you not believe it?"

"It will not be of the slightest use, Mr. Newton; and you may tell him so. Though I suppose it is impossible to make a man believe that."

"Are we both so unfortunate?" he asked.

The poor girl with her wounded love, and every feeling sore within her, had not intended to say any thing that should be cruel or injurious to Gregory himself, and it was not till the words were out of her mouth that she herself perceived their effect. "Oh, Mr. Newton, I was only thinking of him," she said, innocently. "I only meant that Ralph is one of those who always think they are to have every thing they want."

"I am not one of those, Clarissa. And yet I am one who seem never to be tired of asking for that which is not to be given to me. I said to myself when last I went from here that I would never ask again—that I would never trouble you any more." She was sitting with the book in her hand, looking out into the gloom, and now she made no attempt to answer him. "And yet you see here I am," he continued. She was still silent, and her head was still turned away from him; but he could see that tears were streaming down her cheeks. "I have not the power not to come to you while yet there is a chance," he said. "I can live and work without you, but I can have no life of my own. When I first saw you I made a picture to myself of what my life might be, and I cannot get that moved from before my eyes. I am sorry, however, that my coming should make you weep."

"Oh, Mr. Newton, I am so wretched," she said, turning round sharply upon him. For a moment she had thought that she would tell him every thing, and then she checked herself, and remembered how ill-placed such a confidence would be.

"What should make you wretched, dearest?"

"I do not know. I cannot tell. I sometimes think the world is bad altogether, and that I had better die. People are so cruel and so hard, and things are so wrong. But you may tell your brother that he need not think of my cousin Mary. Nothing ever would move her. H—sh—! Here they are. Do not say that I was crying."

He was introduced to the beauty, and, as the lights came, Clarissa escaped. Yes—she was indeed most lovely; but, as he looked on her, Gregory felt that he agreed with Clarissa that nothing on earth would move her. He remained there for another half-hour; but Clarissa did not return, and then he went back to London.

APPLETONS' JOURNAL

OF LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 98.—Vol. V.]

THE STORY OF TWO SILENT PEOPLE.

WITHIN a certain luxurious country flower-garden, well apart from any city, and still surrounded curiously by a high brick wall, stained and striped with the weather, and all awry with age, and where there are many flagged walks, with disorderly weeds thrusting themselves out between the jointures of the tiles; many rich beds and patches of plants of velvety colors; many decaying props resting upon greenish foundations and supporting decrepit trellises; a disfigured fountain, long since dry and nearly overgrown; a row of dismal, tottering vases, rusty, cracked, and infirm; and also, again, where there is a relieving stretch or two of rich ground, scrupulously cared for, and bearing some bright rows of blooming hyacinths, there are two men, at the time when the scene becomes at all interesting to us or to any one.

One is upon his knees. He is a man of sixty years, with whitish hair, reddish thick eyebrows, a long, narrow head, a florid complexion, and thin lips. He has a trowel, and is deeply busied at one of the cultivated beds.

The other is his visitor, and stands beside him looking down at the work. He is also old; as old as the other, and quite as white. His face is still thinner, something less colored, but still healthy and strong. He is dressed with a little more care, not wholly to be accounted for by the fact that his character of visitor would require it, for it is evident that he is more of the world than his host, though both faces carry equal traces of high refinement.

This last, however, has an air of shrewdness which, though not wanting in the other, is much less apparent. The eyes of the same face glance rapidly over the distressed garden many times, and often rest upon the stooping man with much interest and curiosity. They appear to be strangers to the place, and perplexed strangers also, for they seem forever to be demanding why and wherefore the reason of some mysterious inconsistencies. They also regard the worker with something of the same questioning. He finally addresses him with a pleasant voice, but with the barest suspicion of patronage in it, engendered probably by his poor opinion of the delicate but soiling labor of the other.

"Tysoner, is it not a little singular that we should meet, we two whose interests are so peculiar, so very peculiar?"

"Indeed yes, Benidict, very singular; and, I may add, very happy, may I not?" He poises the point of his trowel upon a stone and looks upward with something like a momentary glow in his face. The other responds quickly:

"Yes, you may; and I echo it twice over. Extremely and almost religiously happy. So much so, indeed, that, human-like, I instinctively dread some balk; but if it happens, it must come from something beyond my voice and influence. At any rate, as I feel now."

"And beyond mine also, as I feel now," echoes Tysoner, and again turns thoughtfully to his flowers, but presently resumes: "And really, Benidict, I should think myself a poor guardian of my bright charge if I could not answer for his openness of heart and his generous frankness when it is so apparent. I can imagine no hint of an obstacle for his part." It appears from the infirmness of his tones, and from a mistiness in his eyes as he again looks upward, that the reference is fraught with tender thoughts. To this the other answers quickly as before:

"And I, too, as a guardian of my bright charge, am right in believing in her ready love and gentleness. If it comes to pass, I shall feel that my duty is beautifully rounded, Tysoner."

"And I, too, believe me—I shall too."

They grasp each other's hands for an instant in their honest fervor, and then fall apart again as before, one to his trowelling, and the other to his questioning glances, and the last is much more coherent in his occupation than the first, and becomes calm again much more quickly. He appears much more given to thinking than to dreaming and musing, and, under this idea, a trifling degree of calculation which gathers in his face becomes somewhat explainable. He disperses it several times, as if unwilling that the other should discover it, but it invariably returns as he grows absent to his surroundings. Finally he takes refuge in talking again:

"And I understand you, Tysoner, that he never had a glimmer of the world through those two senses; that he was born, has lived his twenty-one years, and is still at this present moment exactly so."

There is something categorical in the tone which makes the questioned man look up hastily, but he is quieted and reassured by the sad interest of the face which regards him, and his reply is in accord:

"Ay, sorrowfully and completely so. And in regard to her I am to understand that such is precisely the case?"

"Precisely the case."

Here there is another pause, during which Tysoner, still kneeling, toys aimlessly with his trowel, as if endeavoring to make up his mind to enter upon a branch of the subject not yet broached, and Benidict seems engaged in an identical operation. They both remain silent for a moment or two, searching for methods of opening not too abrupt and dissonant. Tysoner finds one first, or is allowed to find it first:

"I suppose our bounden and sworn duty as guardians to these poor children, helpless and hampered as they are, should be very exactly lived up to, even to extravagance."

"Certainly, Tysoner. Rigidly and without sentiment. I am glad you mention it. Go on, sir; I follow you closely."

Thus heartily and openly encouraged, he goes on to:

"We should be sadly neglectful should we permit them to know each other, as we both hope may be the case, and still by any neglect of their interests deprive either of them of their accustomed comforts and luxuries, or expose them to any harshness as man to man, which might have been evaded had they remained in ignorance of each other. You agree, sir?"

"Fully, in every particular mentioned or implied. And as we may mutually open up to them two new lives, we should take care that they should be full of pleasant paths, or at least as barren of pitfalls and anxieties as we can make them; otherwise we should be criminal."

"It seems a little hard," continues Tysoner, "that affairs so delicate, and having so much to do with the higher natures which will be alone considered by our innocent principals, should be so closely allied to possessions, to property, to money; which they will never dream of at all."

It is now that Benidict becomes keenly alert, though under the cover of a somewhat listless manner, and behind a softened and sympathetic face. He nods gently as Tysoner gradually comes to the point, and drops an opportune word to bridge over an impending silence. He feels his companion's eyes upon him, and he is alive to their object, and therefore he pretends to attach as little importance to the turn conversation has taken as is consistent with common interest.

"I may or may not have been a good steward to my poor boy's inheritance," said Tysoner, "but I think it stands well. Here in this particular spot there is rack and ruin, for the reason that his dying father told me to let the house and garden die also, with the exception of these two hyacinth-beds, which David loves the perfume of; and so you find them in the process of death; but all the wide fields are blooming, the houses are in repair, the mills are occupied, and the tenants are prosperous."

Benidict's clear-cut and grave face becomes suffused with pleasure in spite of himself; there is a sweet ring in this for him, and Tysoner, still toying with the trowel, goes on ringing it.

"I think I have farmed his acres to the best advantage, and I have a live-stock to his name which is not to be equalled in the county. He has many shares in railroads, and also many mortgages on estates all about here. There is one which I value much, for it will give him a beautiful place on the other side of the mountains, am told. I have not seen it, but my lawyer has. It is vast and elegant, but wants care—its name is Stonebridge—Benidict! Sir, what ails you?"

Tysoner suddenly beholds a crimson-faced man, with starting eyes and open mouth, gasping for breath, and turning violently away, hardly able to keep his feet. He approaches him, leads him to a seat, where he slowly recovers, and becomes tolerably calm again, and able to speak faintly. He protests that he is subject to fits, turns, which leave him thus susceptible to the heat of the sun. He had one of these yesterday, and was imprudent to stand in the garden thus. He was foolish. He would soon recover. "Pray go on," he says. But it appears that Tysoner has finished, and has nothing to say or do but to assist the ailing man, who soon volunteers to speak for his own account, but does so weakly:

"Ethel is her name, Tysoner; I don't know that I told you her name. And in its sound, if you are at all given to dreaming, which I am, you may see her. Golden-haired, blue-eyed, slender, and spirit-faced. Do you see?" Tysoner nods smilingly, and turns his eyes toward the house, buried amid the foliage not far away. Benidict watches him sharply, but again grows frank as the face turns back again. "I can hardly bear to associate her with her wealth. The memory of the sweet presence, which is almost foreign to this world, fills me up, and no room is left for affairs of money—but this is nonsense, and must be nonsense to you, Tysoner; and, so as you have spoken plainly to me, so I will to you."

Upon this he does speak, and speaks much, and with a polished erasion of exactness. He does not essay particulars, nor affect them, but still there is an easy slipping about among real points which he neither holds nor elaborates. He is by no means prolix nor voluble, but rather given to hesitancy and halting, in the manner of a man who tries hard to separate his lingering mind from a pleasanter subject, but who labors as if unused to it. He oftentimes wanders off into this pleasanter subject, but drags and forces himself back time after time, until he forgets to do so, and so rambles widely from money, and dwells upon Ethel.

The other, nothing loath, in view of his great interest in her, follows him closely, and thus they sit in the long, warm afternoon, talking dreamily and speculating in low voices, and with many smiles and some few quavers in their tones at times, upon the strange features of such a marriage as they are planning between them. They conjure the strange young couple, and hint tenderly at the vagaries of their lives; how strange it must appear in the eyes of others, and, indeed, how strange, how very strange in the minds of the two people themselves.

The vision grows upon them. And as Benidict rises to go away, the two old men strike hands warmly and gently, and in this position go toward the pathway.

Even at this moment, when distrust, or rather dissatisfaction, seems farthest in abeyance, still there crops out in Tysoner's keen mind the idea that he has been told nothing, even if he himself has said nothing, and so, acting upon this, he hopes they may meet once more very soon—the sooner the better, perhaps.

"Certainly," replies the other, "nothing could be more to my mind. Does this day week meet your fancy?"

"Any suggestion of yours, Benidict, will oblige me, so let us say his day week, at the same hour."

"Yes, at the same hour."

They stop a moment to mutely gaze upon a wide-spread, sunny, beautiful intervalle which lies before and beneath them, redolent with midsummer scents, and filled with warm colors of midsummer belongings. Tysoner points out a road running through it, and a clump of willows and poplars, in the midst of which is a reddish house, with a dimly-seen sign-board swinging before it.

"It is there that my dear boy ends his daily stroll. He walks out with a great stick, drinks some cider or beer at the place, and then goes back again to his books and studies."

"Ah," says Benidict, carelessly, "and does he choose the afternoon?"

"No, the morning invariably. He loves the different air."

After a moment they say adieu again, but still linger. Finally, Benidict resolutely starts, having been deeply engaged in thinking for a moment, and steps away, but calls back to know if after all it would make a difference if he came that day week at a little earlier hour than he did this day. Tysoner responds, "Not the slightest," and so, with raised hats and cheerful faces, they separate; each goes his way—one to his carriage at a little distance, and the other to his hyacinths in the neglected garden.

And thus ended the second meeting of two white-haired wary guardians of strange treasures, one of whom is worthy, and the other miserably unworthy.

They happened upon each other by accident, and an accident disclosed what threw them together in a singular sympathy, and both mutually flashed upon the thought which governed their conversation. To join the children would be a fitting and complete end to their undertakings. People would marvel at it, and even they, as they first contemplated it, were a little startled and irresolute, but this was quickly overcome.

What Tysoner now thinks of it is best seen as he again kneels by

his hyacinths. Over his faded and deeply-lined face there rests an expression of calm joy and almost gratitude. He fails to work, but hesitates with his trowel deeply buried in the loam, and dreams what is richly pleasant to him. He lingers over it; his eyes gathering mist at times, and his lips giving way to a certain tremulousness when certain visions grow and group in the stained wall opposite. He often comes back to himself and plunges at the flowers, but just as often wanders off again, rambling among fancies, sweet to look upon, and conjuring sights of happy import. All is centred upon the boy. All is incense to him. What concerns the boy, the bright-spirited, manly boy, concerns him, and, if there is a new and great happiness opening upon him, Tysoner feels it as strongly and as fully; and, therefore, as Tysoner now views this matter, he is strongly and fully happy, so much so, in fact, that he remains kneeling and reflecting until he is reminded and aroused by the shades and damp chilliness of the evening, whereupon he slowly rises and walks away.

What Benidict now thinks of it is best seen by running on ahead of his horse and looking at him as he comes up. He appears to be a man more exultant than profoundly contented, and rapid smiles break upon his face, resembling grimaces rather than tokens of pleasure. In their quick turns they are supplanted by expressions indicative of much scheming and planning. He lies withdrawn and shrunken in the corner of his carriage, and at times breaks into a quiet paroxysm of laughter, in which he strikes his hands upon his knees, and then relapses again. He also breaks out into spasmodic sentences which hint at some suspicious fool who will be befooled in his turn; at some maudlin sentiments fit and convenient to put on at certain times; some close pinch; and also some hopes that this same close pinch may become no closer. Then follows a period of cloudy anxiety and abstracted thought, which finds no exponent but a single sentence pronounced in a tone indicative of the dismissal of a wearying subject.

"He must love her if he has eyes, and I'll answer that they shall be filled with your best looks, Mistress Ethel."

At this he suddenly reins up, and stands upon the seat, and looks off over the darkening valley toward the inn, and, after a long examination of the dimly-seen roads, he steps back again, and drives on rapidly, and loses himself in the overhanging woods.

On the following day, also on the next day to that, and on all following days, and, therefore, on the day known to us as the day week, promptly at ten in the morning a young man emerges upon the porch of the house of the dismantled garden, and, while standing in the breezy sunlight, looks blithely about him, balancing his heavy walking-stick in his hand. He is of good height, slender build, with lightish hair, and a strong mouth. There is a fine, inspiring freedom about him, shown out, even in repose, by the attitude of his head and shoulders. He has a quick and appreciative eye, which catches the cool view, the flowers, the shadows, and the merry, fresh, fluttering action of the clouds of sunlit leaves about him in a single sweep. He throws his shoulders back under the effect, and fills his chest slowly through his parted lips. He smiles to himself, and, with a gesture and face expressive of overflowing spontaneous gladness, breaks away and flies down the steps to the walk. He reaches it and looks back, meeting the face of Tysoner, who is standing at a window watching him. He nods gayly to him, and extends his arms to their utmost, as if embracing all the beautiful landscape, and looks up at the sky, and all about, and then brings his eyes back to Tysoner again, who waves his hand and smiles. The boy makes some rapid sign with his fingers, though he is quite near enough to speak; and Tysoner, instead of replying by words, also rapidly telegraphs some message with his fingers, whereupon they both nod and smile again, and the boy turns upon his heel and breaks into a swinging stride, which is a well-practised one, and which bears him rapidly away.

As he goes, there comes up behind him from the opposite direction the man whose appointment brings him this road, and who fixes his eyes upon the departing lad with much interest and satisfaction. He rests a moment to study him as he tramps onward, and then, after gazing off over the intervalle toward the inn upon the lowlands, he approaches the house, where he is heartily welcomed by Tysoner, and drawn within.

There is something of a bad change in his appearance since a week ago; he is not so erect, nor is his face so firm, and some dark-purplish circles have appeared about his eyes. Tysoner notices this, and anxiously inquires the reason.

"Ah, and so I look as ill as that? I hoped you would not notice it. Another bad turn, Tysoner; it is two days old now, and was a very bad one, indeed—a very racking and torturing one. It twisted me up like a scorched leaf, and, had it not been for Ethel, I should not have been here—no, nor anywhere in this wicked world.—My God!"

The last two words are aspirated, not violently, but rather calmly; giving the idea that the girl's name had in some manner been a *sesame* to a cavern suddenly opening upon him and filled with shadows which oppressed him rather than frightened him; such, perhaps, as some visions of black ingratitude developed by her very care of him, or of stinging remorse, also brought to work by the same means. He quickly suppresses it all, however, and passes off his momentary seriousness in some light way, and they sit down to chat together, and to talk of what obtrudes itself upon them, and with which they are surrounded, the thrice-beautiful day.

They linger over it for a considerable time; both seem content to dally with it, and muse upon it, and yet they continue to keep it in hand so long that they each come gradually to observe that the other is loath to leave it for the impending subject, the cause of their meeting; and so they curiously become sharpened and almost imperceptibly cooler to one another as the time passes, and by slow degrees they slip into a distant but minutely-polite civility.

It is under this chilling cloud, therefore, that they finally arise and formally go into a darkened parlor where there is a table with a formal bottle of red wine and two formal claret-glasses, and they then calmly seat themselves with a determined air of business, and begin formally to talk it over, leaving all sentiment and tenderness to the birds and summer rustlings outside.

It is a question of how much property has Ethel, and how much property has David—a question in which frankness should be tardy, where hearing should be more plenty than telling, and where figures and not similes should predominate. A certain wise old yellow-bird, living a sleepy life in a cage at one of the cool windows, notices that all these particulars are well attempted by the pair, who courteously fence with each other with the most deadly cordiality.

They talk, and glance, and wait. Benidict, fingering the slender stem of his glass, is an adept, and, as a result, is told much more than he tells. He makes considerable ado in way of recompense, but it is mostly froth, and Tysoner finally begins to feel it. The sly old bird, educated perfectly in his master's moods, sees with considerable fright that he is departing from his usual smoothness of manner, and that he sits erect with tightly-closed hands, yet scrupulously courteous in his bearing. Not so much as a tone escapes him which bears suspicion or distrust in it, yet he is keenly observant. He has a feeling of not getting on at all, of being baffled and put off in some indefinite way, and yet there is an unmistakable candor in Benidict which, though verbose, is far from satisfying.

As a matter of fact, Benidict learns satisfactorily. He has the limits, the area, the whereabouts, and the description of David's possessions, and appears to be so careless at what he hears that he nearly yawns. But Tysoner is fed with vague impressions. There are hints of great estates somewhere, and of some sort. There is a rambling talk of lots, and acres of wide woodland, and fertile fields, but there is nothing tangible, nothing definite and placed to his rigid mind. Finally he breaks in upon Benidict rather abruptly. He has an estate under description at the moment:

"Pardon me, Benidict, but you surely forget that I am ignorant of its whereabouts. Your close association with it makes you oblivious that I am a stranger. You have it in your mind in all its beauty, no doubt, and, though you forget I am ignorant, yet I am sure you are very pardonable."

"I ask to be pardoned, certainly," rejoined Benidict, quickly; "but my deep love for Ethel makes me like to dwell upon what concerns her, so that I forget that I am explaining to any one else; you'll excuse me?"

"Ten thousand times," cried Tysoner, heartily, and flushing a trifle at his want of confidence. "And it was also my deep love for my poor boy that made me for the moment so particular; but pray forget it."

Whereupon Benidict goes on still ingeniously indefinite, but by mischance mentions the place as being in the region beyond the Blue Hills. At the mention of these, Tysoner interrupts him with the question:

"Then you must know something of Stonebridge?"

Benidict meets with a sudden accident. The slender stem of his glass cracks to pieces in his hand, and the bowl shivers on the marble. He reclines in his chair, not with the air of a startled and apologetic man, but of one who is being calmly stifled. For a moment he is pale and apathetic; he gazes silently at the fragments of glass without seeing them, and, having something the appearance of one upon whom there has rushed a volume of poisonous air, having in this case perhaps some withering memories conveyed upon the breath which has been fashioned into "Stonebridge."

Presently he releases himself, and, raising his eyes, he meets those of the wondering Tysoner, who hints that perhaps the room is close for him. He catches at this, and says that it is close.

"Let us get out of it. Come into the air. It is suffocating; let us walk along and talk where there is more sunshine."

The wise old bird, still sharply watchful after his master, is impressed with the idea that his master is sharply watchful after his visitor. He has never seen him so cold in the presence of illness, or more chary of sympathetic words and looks. On the contrary, as a positive condition, he has never seen his thick eyebrows sink lower, or his lips become more tightly compressed, or his steps more deliberately placed, or, as a whole, he has never witnessed such a general appearance of ruffling in all ways, or of becoming more openly antagonistic. He sees them pass out at the door, sees Benidict look long and eagerly over toward the reddish inn once again, and then sees the two walk away together casually, as it appears, toward this very inn, and, as they go, they fall some distance apart, although the path by no means requires it. Benidict is speaking as they disappear in continuation apparently of something which the bird has had the misfortune to lose.

"Yes—yes, I'd do every thing and any thing for Ethel, so lame and unfitted for the world—and especially now. I would do twice as much as before. I and mine would fall before my wish to serve her now, and I wish that God would grant, by some miracle, that I should have no reason to emphasize *now*, above all the rest of the time."

At this there are looks of astonishment from Tysoner, but they pass on in the glowing light out of sight and hearing, but still apart. Meanwhile he of the heavy staff and brilliant face has been fulfilling his contract with Health, and has been busy at tramping his stout not laboriously but elastically and happily. The old route is new to him. The rough road-side walls of lichen-bowlders, the beautiful sky, the wide-stretched, dreamy prospect, and the grassy blooming fields on his either hand, never pall upon him, or elude his devotional glance.

The word is a proper one, for he is a deep worshipper. A man of ardent temper within the form of a boy. One who would throw himself at the feet of the beautiful if it were a happy beauty, and who would forget grandeur for a smile. Other men like him would have sung or called at something under the arousing impulses of the sun and landscape, but he was as silent as the grave, though there was recompensing hymn in his softened eyes and blithesome step.

Suddenly he stops with a violent flush in his face, and looks about him. He then hurriedly withdraws a pocket-almanac, and runs his eyes over the dates of June, and fixes upon one intently. He is flected with a strange mixture of surprise and wild pleasure in his glance. This is quickly replaced by a shadow of regret, during the lingering of which he turns upon his heel and gazes back toward the house he has left in the distance. And then again this fades as quickly as it came, and he keeps on with his march, swinging his staff gleefully over his head in circles, and, strangely, all without a single word or sound from his parted lips.

He walked as if his spirit outflowed his body, and he were engaged in a walking-race after it. He turns into a descending by-lane which rambles to the right and left of trees and rocks, as if too timid to go through any thing. A good mile brings him to a gravelly meadow road, overhung with huge shady elms and marshalled poplars. Twice he stops at some turn of the way to put out his arms toward the quiet loveliness of the spot, as if to embrace it, and then twice goes on with glistening eyes and a face of enthusiasm and vigor. His beautiful face grows more beautiful; and his full and delighted heart rests plainly upon his forehead, in his burning gaze, in his flushed cheeks, and in his silent lips, so painfully and absolutely silent.

He turns joyfully into the shadowy inn-yard; a cool, breezy

of green boughs and trellised vines. He is here met upon the little flagged walk by a soft-faced woman, the hostess, who welcomes him as Tysoner bade him adieu, with some gestures of her hands, something slower than Tysoner's, and a smile. She is replied to by the same method, but at greater length. She reads:

"A thousand good-mornings to-day—to-day of all days! I do not comprehend the day, and I am inclined to be lonely."

There is such a touch of absurdity in this, that they both burst into a laugh, loudly on her part, and silently on his. "But why to-day in particular?" she asks. Ah, he will tell her some time, and he shakes his head mysteriously. Then she for her part must needs have a mystery, and so takes his hand, and draws him aside, with her finger to her lip, though she hastily withdraws it, with a repentant blush, as the mockery of the action flashes upon her. She leads him slowly to a place whence they gaze down a deeply-shaded path-way, at the farther end of which, seated upon a garden-chair, with her hands folded upon her lap before her, and beautifully played upon by the sunlight and leaf-shadows, is a sweet-faced, golden-haired girl, day-dreaming. To such a tone of spirit has the boy been brought by the charms of the day, and his thoughts have been so hallowed by the glories he has been so quick to see and love, that the vision before him slips in upon him calmly, but very deeply, and he feels ready to thus stand and intently gaze forever. He watches the gentle breathings of the air upon her, the posture of her slender form, the grace and happiness of her face, so bright and brilliant. He would have gone to her at once and stood beside her, trusting in some vague way that she would not have flown from him, for, being open and generous, he could be thus strongly confident that no suspicion could fall upon him. The hand of his hostess restrained him, however, and she passed him, and advanced toward the young girl. She arose quickly, with a smile.

The hostess stopped and made some signs, as she had to David. Her answer came also without words, as his did, but by the way of a slight, white, rapidly-glancing hand, and the sympathy of an exquisite face.

"Ah, madam, I could be happy here, all is so beautiful, so sunny. Every thing is like me, silent, yet full of language."

The hostess slipped aside, and the eyes of the two fell upon each other at a flash.

The boy trembling spoke in his saddening fashion:

"And I, too, am like all the rest, without ears and without a tongue. And you?"

She answers also tremblingly, but eagerly, with dimming eyes:

"And I also. I grope with my fingers for crutches."

He approaches with a quick smile, and hastily spells out a fancy. "And perhaps, for my part, it was meant so that I might be able to talk with you."

She smiles in return, and gives him a hand warmly.

"Ah, yes, perhaps. Who knows?"

The hostess breaks in upon them for a moment, and then leaves them, and goes away.

Thus the two fall together. Each strangely and sorrowfully bereft, and each divinely rich in sympathy and love. Each sadly lamed, and still each fully rounded and endowed in a thrice recompensing way, and in ways so much alike. They look upon each other as either would upon a deep and miraculous pleasure.

Her fairy-like hands, with their quick shuttle-play of words, with her reflective face smiling and ingenuous, his lightening-like impetuosity and his frankness, seem alike to each something rare and valuable.

They sit awhile, mysteriously asking and answering, describing and relating, and then rise and stroll slowly away together; not separated, nor yet arm in arm, but in the fashion of childhood or of ancient days, long past—that of hand in hand; while with parted lips he gazes wonderingly at the rapidly, brilliantly talking other hand, which in some manner has become suddenly dear to him.

After a period of silence and desertion at the inn, which perhaps is not so strange at this particular hour of the day nor to this particular place, the other pair approach it, still preserving their ominous distance, though Benedict lags in a manner still more ominous, inasmuch as his step has grown feeble and halting. Tysoner crosses rapidly and stops at the red palings, and commandingly calls:

"Fairley!—Fairley!—Joanna Fairley!"

She comes hurriedly, in the form of the hostess, and breathlessly waits upon him, glancing fearfully at Benedict, who has grasped the

palings tightly, and manfully labors to look strong, but fails badly.

"Where is my boy? Where is David? At the table, inside?"

"No sir," she answers promptly, pointing off, "he has slipped away into the woods beyond." She would have added more information, but for some covert influence of Benedict's eyes, which quiet her here. Tysoner impatiently replies, and, turning on his heel, strides away, while Benedict lingers to whisper a question, which he does with anxiety and a paler face.

"And she, has she gone? Are they together?"

"Ay, together," she replies with a nod of satisfaction.

His face flushes, and a short-lived smile of gratification breaks over it and disappears. He turns shortly about and catches up with Tysoner after much effort, and addresses him:

"Tysoner! Tysoner! Wait for me, it is very bad on me just now." Here he presses both his hands to his temples, and walks in this position for some distance, while the other tardily nears him with a look of pity, and they continue slowly.

"Tysoner, let us go over it once more, calmly this time. Let us look at it coolly, not hastily. You are too hot, Tysoner, very much too hot."

"Well," replied the other, chafing under the allegation. "Perhaps I am. But you are so unreasonable, so preposterous."

"No, not unreasonable, but discreet. Why should I lay bare my charge's affairs at this stage? I know nothing of how she may love or dislike your charge, nor how he may love or dislike her."

"But you wormed his affairs out of me. You know every thing. Didn't your discreetness prick your conscience when I was talking? You aren't open, Benedict, you're not above-board." There is a touch of savageness in this last, a tone which suggests stronger tones behind.

"This isn't being calm, Tysoner," protests the other with a vain attempt at laying his hand upon Tysoner's shoulder. "You are dropping back."

"Just look at it, and see why I should be cool, or why I shouldn't drop back. What do you tell me? Not a single fact or tangible story. What do I ask you? Every thing that I must know before I can trust my boy's property out of my hands. When I mention estates, you press your head and tremble; when I mention encumbrances, you turn pale as a ghost; when I breathe the single, common word, mortgages, you seem fit to drop and die where you step. What does all this mean? Fairness? openness? I tell you it looks to me like something else."

Tysoner evidently looks to see an outbreak on the part of Benedict, and seems ruffled purposely to meet him. But his antagonist is calm, keeps his eyes upon the ground, and presently speaks in a tone as quiet as his bearing.

"No, this should not begin with measuring property, Tysoner. It is a matter of affections and fitness. Let them meet. Let them try their temperaments. There may be some sad discrepancies, sad grounds for future miserable haggings and quarrels, for which, if not found by this method, you and I would be responsible. So, I say, let them meet."

"And I say," retorts the other, angrily, facing around and beating one hand into the other, "and I say, keep them apart. Separate them. Don't allow them in the same township together. Keep strict watches, and make commands, rather than have one lay his eyes on the face of the other. Your plan looks like a scheme, Benedict; I tell you it all looks like a scheme, and so I am going to warn my poor maimed boy that even he is not safe."

At this point begins the strange scene of two old men, both white-haired, both somewhat bent, and both importunate, fiercely wrangling. They pass insensibly on, blind to the paths, and also to obstructions. Both are accusative, one of his own intent, and the other by way of retaliation. The latter soon slips into a retreat, and essays a silence; or, perhaps, is forced into it by lack of breath and energy, for his illness, latterly kept in hand by force, seems to be creeping upon him.

As he stumbles along, with his ears tortured by the words of Tysoner, whose bitter reproaches for heartlessness seem to pierce him, he glances about at every turn, nervously awake to his surroundings. It appears to him that Tysoner is immeasurably larger than he, or that he himself is wonderfully shrunken. He feels that a crushing ban is being put upon him, and he begins to pray that something may crowd in to stop the angry slurs, which have long since silenced him.

He is also harassed by a wild fear, which is evidenced by a more

eager gazing and peering before, behind, and on either hand. It is forced upon him by finding that his eyes and his malady are engaged in a race, and for this reason he hunts at every step. Suddenly he halts, erects himself, gazes beyond at the opening of the glade upon the river-bank, and then slips backward, and rests against a sturdy trunk. He beholds a consummation. He sees it in the idolatrous lingering of Tysoner's charge, at the feet of Ethel, in his glowing smile, his tender eyes, and parted lips, and also in her gaze, strangely bright and strangely eloquent.

Tysoner also sees them at the same moment. He trembles from head to foot. He turns his eyes swiftly upon Benidict, and transmits through them a swift intelligence, and a look of consuming, furious anger. He suddenly quits him, and plunges forward, and breaks in upon the two with flaming eyes, and seizes the boy by the wrist and drags him fiercely up and out into the glade, where Ethel follows, with wringing hands and dilated eyes, and clasps him by the arm.

"So, Benidict!" shouts Tysoner, hoarsely, still holding the boy's hand, "it is a plan? What is there yet to come? Let us have it!"

The man thus addressed feels himself rapidly sinking, and so answers weakly, but with all his mustered strength.

"There is nothing more to come of it that I shall do, Tysoner. I have brought them to meet each other in spite of you, so that she shall have a home and a heart to fly to in her need. I gave her the last, but—I have taken the first away."

The purplish rings gather more deeply about his eyes, and, even as they gaze at him in astonishment, his limbs droop one by one, like those of a wounded animal.

"And pray what may you mean by that?" demands Tysoner, with a strong attempt at ignoring the sight. "Answer, man!"

"Mean?—I mean years of torture, of cutting, hacking remorse; years of struggles to cover my cheat; years in which her pure face and loving words to me have been turned to piercing stings. I mean that Stonebridge, and every acre of hers, is mortgaged to you and yours."

The boy tore away from Tysoner, who stood aghast, and placed himself before them, and motioned vehemently.

"What is all this, what does it mean, sir?"

He gets no reply, for the reason that the young girl suddenly darted between them, and ran to the support of Benidict, who was falling. He sank slowly down, with her arms about his neck. A moment passed in oppressive silence; and then he roused himself to look upward at her face, which bent over him. He raised his hand to his breast and spoke to her, and as brokenly and disjointedly as if he had articulated:

"My darling—he will tell you how it is—it is cruel. I was your enemy—"

"No, no, not my enemy, you could not be," she breaks in passionately, "but my friend."

He chokes and gasps at this as if it were a garrote.

"No, I am your bitter enemy—he will tell you how—I have cheated you out of Stonebridge." He waits to see some change in her face, but none comes, save to deepen its beauty and its pitying sympathy.

"There is still another cheat which is just now finished—if you are happy, very happy, it is through a lie told by me to him that you are so—he will tell you that, Ethel darling, with all the miserable rest—I might have a glimmer of satisfaction perhaps—yes, I could be quite happy—do you love him?"

"No!" thundered Tysoner, bursting from out the pity which had begun to make him more tender, "your wretched plan stops here, Benidict. They shall never have another word together!" Here he turned upon the boy, and rapidly gesticulated. "You have been drawn into a meeting with the girl. The man is a knave. I command you to leave the wood. I order you to go out of her sight!"

The girl looked appalled at his flaming face and outstretched arm, and buried her face in her hand. Benidict closed his eyes and sank more heavily upon his arm.

The boy approached Tysoner with a face also flaming, though less with anger than enthusiasm, and silently said the following:

"If both were true, I should be none the less happy. And I am happy above all men. What is mine is henceforth as much hers. We should be happy to have your love, but you command me no longer—remember the day!"

Tysoner caught his breath through his pallid lips, his charge and trust had expired. The control was to be controlled no longer, and

he, the controller, thus bereft, lonely, and useless, turned away in bitter, stifling, and harrowing silence.

The boy knelt by Benidict, with Ethel opposite. The suffering man, now something easier and calmer, thus brokenly addressed them, in the same strange, mute way:

"Ethel, I am asking pardon of you upon my knees." She gently places her hand upon his, but he releases it and goes on: "I am conscious that good has mysteriously come out of it, but I hide my face with shame. Kiss me, and think of me ever after as always kneeling before you with bowed head, and in prayer—and this between you is to be—"

She catches at the question, and with her beautiful hand answers tearfully, "Yes, forever!" And smiles to him thus implicated, who also answers with more firmness of motion, but reverently:

"Yes, irrevocably, and forever!"

Then, as there are some strange changes in the reclining face, they fly to the river together for water, and are gone a moment. They return and find that Benidict has dragged himself to where Tysoner stands, and see that something is being said in a language they never knew, and even that gaspingly and painfully:

"Tysoner, for myself I say nothing, but for Ethel everything. She is true and lovable, and worthy of love. Do not shut yourself to her, for the crime is mine, and this way of recompense is mine alone."

"No," is the deep response, "nor to you; will you take my hand? So, hold it tightly, Benidict. See, I hold yours tightly and shake it."

They raise him and bear him gently to the road-side inn, where he rests far into the summer days, and then is borne gently elsewhere, and from among them, and out of their sight. From this the remaining three go on together, and the journey is eminently happy, for it lies in pleasant places, and they who travel it take notice of the way-stones, and conjure from them eternal and grateful memories of that whence they started.

ALBERT WEBSTER, JR.

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER VI.

AND how was it with Daisy now? Just thus: life seemed one uncomprehended ache. The long, lovely summer days, the long, lonely summer evenings, were full of an intolerable something, the reason of which, the nature of which, she was always vainly trying to discover. Sometimes Daisy, busy with her needle, in the house or in the garden, while Myrrha rode with Mr. Stewart, would think for hours uninterruptedly, and in these hours she thought much of her child. There was something in the world (had it been dead, she knew she would have been told) which was hers, and no other's. And, instead of clasping it close, she had shut her arms and her heart against it. Therefore, of her loneliness she had no right to complain.

"She will stay with me till she is married, I suppose," Daisy said to herself, one evening, looking at Myrrha; "I suppose, she must be married from here. Well, I hope it will be soon. I shall be glad to have it over. Will Kenneth be happy? Will Kenneth be happy? That should be my only question, my only care. Will Kenneth be happy?" She sighed. "Perhaps," she went on, "when a man is as old as Kenneth before he marries, when he marries he likes to have his wife young enough to be to him something of a child: he isn't used to sympathy and companionship, and doesn't need them. If only I could believe in Myrrha. If her childishness were more of the sweet, simple sort. But she is so strange a mixture. In some ways, so old-hearted, so worldly-wise. If I could even be sure that she loves him—that she can love any thing but herself."

Myrrha sat on a low chair, her face on her hand, her elbow on her knee, gazing into the fire that had been lighted to please her. She said, the evening was cold, and that to be cold made her cross. She said, too, that her ride, which had been unusually short that afternoon, had been "nasty" and "disagreeable." Her attitude was disconsolate, the expression of her face was sullen. After several timid glances at the girl, Daisy, in crossing the room, paused behind her, and laid a soft hand on her shoulder.

"Myrrha," she began—her voice trembled with earnestness, and her eyes moistened as she spoke—"you are not playing with him, as you tell me you have done with others, are you? Remember he is not a young man, with all the chances of life before him. He has

suffered much. He has had in life much sorrow and little joy. And, Myrrha, he is so good; so noble, so patient, so unselfish, so good. Forgive me for speaking to you so, but, Myrrha, he is so dear a friend of mine, his happiness is so much to me. Tell me you love him, and that you mean to be to him a good and faithful wife."

"Whom in the world are you speaking about, Aunt Daisy?" Myrrha asked roughly.

"Of whom should I be speaking, but of Mr. Stewart?"

"Mr. Stewart! I make Mr. Stewart 'a good and faithful wife!' You've been asleep and dreaming, Aunt Daisy."

"Do you mean, Myrrha, that you are not engaged to Mr. Stewart?"

"Certainly, I do mean, Aunt Daisy, that I am not engaged to Mr. Stewart. Why, he's old enough to be my father! That you should be engaged to him, that you should make him a good and faithful wife, would be much more suitable."

"Myrrha!"

"Aunt Daisy, you're a fool—or—ah yes, I know I'm rude and rough, but I don't mean it unkindly. Your love Mr. Stewart, and he's fond of you. You are always hankering after him; the idea of his marrying me has been making you look like a martyr. Why on earth don't you marry him, and have done with it? I begin to think you must be married already, or something! How else is one to understand your conduct? You know he's fond of you, you know you love him as you love your life, but you 'don't mean to marry.' Now, Aunt Daisy, I've some common-sense, and I know there must be more in this than meets the eye: something more than old-maidish nonsense and scruples."

Daisy had turned from pale to red, and then from red to pale; but she had been too much taken by surprise to check this outbreak, and Myrrha went on:

"I'll tell you what I think of Mr. Stewart, and then you'll understand that I, at least, am not dying of love for him. I think him a detestable prig, an insufferable pedant, and a ridiculous coxcomb. You may tell him so, with my compliments, if you like, Aunt Daisy." So saying, Myrrha left the room.

In five or ten minutes she returned to it, knelt down before Daisy, and held her soft cheek to Daisy's lips. "Please forgive me, Aunt Daisy. I was abominably rude. Something had put me out."

Daisy kissed her, but did not speak. Myrrha got up, lingered irresolutely a moment, then went away.

Daisy did not attach much importance to Myrrha's plain denial of any engagement between herself and Mr. Stewart; she knew that Myrrha was clever at all kinds of prevarication, and not even appalled by positive untruth. She concluded there had been between Myrrha and Mr. Stewart some more or less serious quarrel; she had noticed that Mr. Stewart had looked gravely displeased, and had bid Miss Brown good-night very coldly.

The next day, Mr. Stewart did not come to the cottage, nor the next. Myrrha had no rides; she drooped visibly. The third day Daisy noticed that Myrrha seemed always listening, and on the watch. She was much in the garden, always where she could see the gate.

In the afternoon of this third day, Mr. Stewart walked over. Myrrha met him at the gate, and Daisy saw the meeting from the open drawing-room window.

Mr. Stewart was about to pass Myrrha with a bow.

She stepped in front of him. "My visit is to your Aunt Daisy, Miss Brown."

Myrrha laid her hand on his arm, pleadingly. Daisy could not hear what was spoken now, the tone of both was low. But Myrrha's upturned, earnest face, and Mr. Stewart's attentive, listening attitude told her enough. Evidently Myrrha succeeded in obtaining forgiveness for whatever offence she had committed. She kept her hand upon his arm, and, Myrrha laughing, Mr. Stewart trying still to look grave, they came into the house, into the drawing-room, where Daisy sat.

"Aunt Daisy," Myrrha said, coming and kneeling down before her, "I am Mr. Stewart's captive, and he insists upon bringing me to your feet. Our quarrel, the other day—the quarrel that made me so cross—was about you, Aunt Daisy. Mr. Stewart will only forgive me on condition that I express my sorrow for having spoken rudely and falsely. I express my sorrow for having spoken rudely and falsely. Please forgive me, and then I shall be taken for some rides again."

Daisy leaned down and kissed her.

Myrrha sprang up.

"There, now I shall get a ride to-morrow, sha'n't I, Mr. Stewart?"

"Certainly, if you wish, and if the weather allow."

"All the same," muttered Myrrha, nodding to herself, as she moved away, "I said nothing but what was true."

And so, for a little while, things went on just as before again.

One day, Mr. Stewart asked Daisy to show Myrrha some of her sketches, adding:

"I'm surprised to find she didn't even know you could draw."

"I never do draw now."

"But you will let her see how you used to draw. If my memory is at all accurate, she will be able to learn a good deal—should she choose to do so—by looking over your portfolio. May I fetch it? Is it where I can find it?"

"No; I must look for it myself."

Daisy went to her room and dragged a large, old portfolio out of a closet; hastily turning over its contents, she withdrew several sketches, which she put away out of sight. They were studies of foreign scenes, and would have led to much questioning. She sent the folio down-stairs, and was a few minutes before she followed it. It was painful to her, to have looked it over; it was ruffling too many pages of memory.

Daisy, when she returned to the drawing-room, sat apart, took up a book, and tried not to turn the attention of either her eyes or her ears toward the table where Myrrha and Mr. Stewart sat. She was not long left in peace.

"Where is this, Daisy?" Mr. Stewart asked. "An old farmhouse I don't remember to have seen. A curious study of greens and grays."

Daisy looked up. Mr. Stewart held in his hand a careful drawing of Moor-Edge farm-house, made long ago, before it had come to be the house of her dear old nurse. Daisy paused, her color changed; she answered, trying to speak carelessly:

"That is the farm-house nurse expected to go to, when she married. She asked me to make her a picture of it. I did that for her, before she was married. I thought she had it."

"Didn't she go to it, then? Isn't this where you stayed with her?"

"Oh no."

Mr. Stewart then was evidently about to ask something more. But Daisy, though she tried not to do so, looked up at him. There must have been terror and appeal in her eyes, for his were inquiring and compassionate. Daisy's look, falling from Mr. Stewart's face, fixed itself on the picture: a trance-like feeling came over her, as if she had suddenly begun to dream. It was as if out of those walls and windows, no longer pictured but real, her child cried to her; and in her heart there was a responsive cry. By-and-by, when she thought she could do so unobserved, she rose up and left the room. Unobserved! One pair of love-watchful eyes, one pair that shone with somewhat malicious curiosity, noticed the feebleness with which she moved.

"Aunt Daisy is not well. Hadn't I better go to her?"

"I think she would rather be alone."

"Aunt Daisy has just told you a falsehood, and telling falsehoods doesn't agree with poor dear Aunt Daisy. You have often spoken of Aunt Daisy as a model of candor and simple truth. I admit she isn't clever at speaking what isn't true; and doesn't seem to be used to it!"

"Your Aunt Daisy is a model of candor and simple truth. Speaking of her as such, I spoke truly of her."

"Yet she has just told you a lie. You know that as well as I do!"

"I think, Miss Brown, it would be more becoming in you to refrain from such free speaking."

Myrrha appeared not to hear this remark. She said, with a show of feeling:

"Sometimes, Mr. Stewart, I feel afraid that poor Aunt Daisy is very unhappy; that she has some secret which preys upon her. If she has, wouldn't she tell it to you who are such an old friend? If you told her you were sure she had a secret, and begged her to tell it to you, don't you think she would?"

Myrrha gave a quick, investigating glance into Mr. Stewart's face. She was wondering if he already knew or guessed Aunt Daisy's secret. A secret there was, she was by this time quite sure.

"You young girls are so full of romantic fancies in this novel-reading age. Your Aunt Daisy is not the sort of woman to have any thing concerning herself to conceal. If she has a secret it is not her own. Possibly, that farmer her old nurse married has got into difficulties, and she has promised not to tell any one where he is now living."

"You suspect something quite different from that," said Myrrha, nodding knowingly. "That is a quite absurdly inadequate cause for things I have noticed. I have my own suspicions, but—"

"I will not have your Aunt Daisy and 'suspicions' named together," he answered, angrily. Then he went on more calmly: "You entirely fail to understand your Aunt Daisy's character. Though she may have more delicacy and reserve of feeling than is usual in these days, she is not a woman to have secrets and concealments. Where she loves she would trust."

"But perhaps, Mr. Stewart, poor Aunt Daisy, who seems so lonely, has never loved any one enough to trust him entirely."

Those words of Myrrha's fell coldly on Mr. Stewart's heart. Myrrha went on: "You see, Mr. Stewart, Aunt Daisy is so peculiarly lonely. I am the only connection, not to say relation, she has whom she knows. And I don't think she loves me very much, and I know she doesn't trust me at all. Whom else has she?"

"So you evidently don't think, Miss Brown, that your Aunt Daisy loves and trusts me?"

"I can only answer by stating facts. Aunt Daisy has, I am sure, a secret. You don't know it, she doesn't mean you to know it. I suppose, therefore, she doesn't trust you. As to loving you, it wouldn't, of course, be proper she should love you, unless as her lover; and, it seems, she won't have you as that. You are a man, you are no relation, you are not a proper person for Aunt Daisy to love and trust, unless she meant to marry you. Aunt Daisy doesn't mean to marry you. Aunt Daisy isn't the sort of woman to do what isn't proper; therefore, I suppose, she doesn't love and trust you."

"How logical!"

"You needn't sneer at me."

"How is it you state so positively that your Aunt Daisy doesn't mean to marry me?"

"Hasn't she told you so herself?" was Myrrha's counter-question.

"I was asking the reason of your belief."

"She has told me that she doesn't mean to marry; and I'm quite, quite sure that there's some serious secret at the bottom of her not meaning to marry."

"You can't, I suppose, understand that there may be women who don't wish to marry, merely because they don't wish to marry?"

"You mean that for impertinence; but—"

Here the entrance of a servant, asking for Daisy, interrupted them; soon after Daisy herself came into the room. Within a few minutes of that Mr. Stewart rose to take his leave.

"Myrrha," he said, bluntly, "I want a few words alone with your Aunt Daisy."

He spoke holding the door open.

"You mean I am to go away?"

"If I may so far trouble you."

She swept out, giving him, as she passed him, a somewhat mocking smile and a significant nod.

Daisy looked frightened, and began to tremble. "Is any thing the matter? If it is only—about Myrrha—you needn't trouble to tell me. I know."

"It is not about Myrrha, it is about myself and yourself. It is only a word. I want no answer. You needn't speak. I only want you to know that I am changed in nothing—that I am ready, that I am longing to take all your cares and troubles, of whatever kind they may be (remember, I say it, and I mean it, of whatever kind they may be), to be my cares and troubles. Twice lately you have said to me what was not true, Daisy; more than I can tell you it has hurt me that you should do that; but I trust you, nevertheless. You needn't speak. I merely wish you to know that I am waiting for you still, that I shall always wait for you till I get you. That as much as ever I wanted you, which is as much as a man ever wanted a woman, I still want you for my wife."

Daisy was now trembling very visibly. He went away before she had said any other word.

"With all your cares and troubles of whatever nature," she repeated. "What a stress he laid upon that. To think how he loves

me! And how I love him! And I may not tell him I love him, love him, love him! May not throw my arms round his dear neck, and say, 'Take me, do with me any thing you will.'"

Daisy dreamt, wide-eyed, of the deliciousness of such surrender. Then Myrrha came in.

"Well, Aunt Daisy, may I congratulate you? Do you still say you don't mean to marry?"

"Yes, Myrrha, there is no change." But she felt as if there were change—as if the whole world had changed. She wished the girl good-night, and locked herself into her own room.

Daisy had no sleep that night. All the fight was fought over again. All the perplexity of her trouble was reawakened; but the core of her consciousness was sweet, was love. When she drew aside her curtains, and looked out into a fair, still autumn dawn, she said:

"He shall have the truth. It will tear my life out to tell him; but he has a right to my life. He shall have the truth. Things sha'n't go on in this way any longer. I am wasting his life. He shall have the truth." It had come, she felt, to the ultimate extremity—she must now say to Kenneth: "All this time I have been deceiving you. I have been a wife. I am a mother. You think me innocent, loving, truthful. I hated my husband. I deserted my child. I have lied with my whole life. I have deceived you."

At first she thought she would write her confession; but she felt as if she must know how he would look when he heard it, how he would feel it, how he would bear it.

Mr. Stewart, when he came to the cottage next morning, found Myrrha still in her morning-dress, standing at the gate.

"You have forgotten we settled it would not any longer be too warm for morning rides?"

Myrrha made no answer, except:

"Oh, Mr. Stewart!"

He saw that she had been crying, and looked painfully excited; he was off his horse and at her side in a moment.

"Is any thing the matter? Your Aunt Daisy is not ill?"

"Send the man away," commanded Myrrha.

"Not till I know I shall not want him."

"Come out of his hearing then."

With a muttered, "Confound the girl!" Mr. Stewart followed Myrrha from the gate. Myrrha presently stopped, turned and faced him with the words:

"Mr. Stewart, Aunt Daisy is gone."

"Gone." He stood quite still a moment. Then he went to the gate to order his groom to take the horses back; to have his hunter saddled, and waiting at the corner of the lane in as short a time as possible.

"Now, Myrrha, just the simple truth of all you know, as quickly as possible," he said, returning to her. "What do you mean when you say that your Aunt Daisy is gone?"

"Mean? I mean just what I say. Aunt Daisy is gone!"

"When? How? Where?"

"I don't know any thing about where: I know very little about any thing; and what I do know I won't tell you if you speak so crossly, and look so angry, as if it were my fault. As if I were not as great a sufferer as anybody. As if I hadn't had enough to shake my nerves already." And Myrrha began to sob.

"There, there," said Mr. Stewart, soothingly. "I beg your pardon if I was ungentle. Now be a good, sensible girl, Myrrha, forget yourself for once, and just tell me what there is to tell. Not much, I expect. It will prove to be a much-ado-about-nothing sort of story. Come, just tell me all you know." He took her hand, drew it through his arm, and led her to a garden-seat. Myrrha dried her eyes and sat down.

"It was a letter did it, Mr. Stewart, a letter that came this morning—of this I feel quite sure. But she told me nothing, she never trusted me. I know nothing. But I'm sure it's something very bad. I believe we shall never see her again. I fancy, I've an impression, that she's gone away to drown herself."

Here Myrrha, who was vaguely alarmed, and had a very genuine consciousness of the discomfort of her own position, began to sob again.

"I want neither your beliefs, nor fancies, nor impressions, nor any such nonsense as you have just spoken. Just tell me, from the beginning, what took place. First, when you say it was a letter did it, what do you mean by 'did it'?"

"I mean frightened her so that she ran away."

"Ran away, pshaw! Possibly she heard of the illness of some friend, and is gone for the day, to be back at night."

"Mr. Stewart, it was much more than that!" Myrrha said, with angry solemnity. "She is not coming back. She told me as good as that she was not coming back."

"Her words—tell me in what words she said she was not coming back." Quite unintentionally he slightly shook Myrrha's arm as he spoke. Myrrha withdrew it indignantly.

"How rough, how unkind you are!" she exclaimed. "You might have some feeling for me, Mr. Stewart; I'm sure I'm to be pitied. What can I do? What will become of me? I can't, young as I am, stay here alone, and where am I to go?"

"We will settle all that afterward; the first thing is for me to know all I can about your Aunt Daisy. What were her words when she 'as good as told you' she was not coming back?"

"She said that if she didn't come back, I was to ask you for advice; that you would be a true friend to me."

"Was that this morning or last night?"

"This morning."

"And about the letter? It came by post?"

"I suppose so; the post was in when I came down. I was late this morning, for I didn't sleep well last night, and I woke with a headache; one of my very bad headaches. I've been subject to them ever since—"

"Never mind about your headaches just now. Your aunt had read this letter, to which you attach so much importance, when you came down?"

"No; and I don't think she had seen it. It lay under one for me."

"You saw nothing different from usual in your Aunt Daisy till she read that letter?"

"No. She flushed up when I gave it to her. I didn't suppose it could be interesting, and I was surprised to see her flush."

"Why didn't you suppose it could be interesting?"

"It didn't look like a gentleman's letter, or a lady's. I didn't pay any particular attention to her as she read the letter, because my own letter was very interesting" (with a conscious air), "and it was long. I didn't notice Aunt Daisy till I'd finished it, and then—"

"Well?"

"Then I looked up, and was going to tell her something" (this spoken with that same conscious air), "but I saw her looking so that she frightened me."

"How did she look?"

"She looked awful, just like a person coming out of a bad swoon."

"What did she say?"

"Of course I asked her what was the matter. At first she didn't seem alive enough to speak. The first thing she did say was just to ask me to ring the bell for Mrs. Moss."

"Well! when Mrs. Moss came, what did your Aunt Daisy say to her?"

"She just told her she'd had bad news, and must go away."

"Go away for a day or so, she said, of course?"

"She said nothing of the sort. She only told Mrs. Moss to pack a few things for her as quickly as possible, and to send at once to the village to order the fly."

"To take her where?"

"To the station."

"Well, go on."

"That is all."

"You have nothing more to tell me?"

"Nothing."

"Child, why in the name of all that was irrational, didn't you send to me at once?"

"She told me not to do so."

"She left no message for me?"

"Yes, she did."

"Myrrha, you would try any man's patience. What was it? And why didn't you deliver it at once?"

"Have you given me time? Haven't I had enough to do in answering your questions? The message was only this—I was to tell Kenneth that she would soon write; that, meanwhile, he was not to be anxious for her, that no harm had happened to her, or, as far as she knew, was likely to happen to her."

"No harm had happened to her, or, as far as she knew, was likely

to happen to her!" Mr. Stewart repeated this to himself, as he went off to find Mrs. Moss. From her he gathered no further information; but it somewhat reassured him to find that she evidently expected her mistress's return within a very short time.

"You should have gone with her, Mrs. Moss."

"Sir, she forbade it utterly."

Mr. Stewart went into the breakfast-room. He looked about there keenly and searchingly, possibly hoping to find the envelope of the letter, and so to get some clew. Presently Myrrha stood beside him.

"Mr. Stewart," she said, in a just audible whisper, "what can it mean? Won't you tell me what you think is the matter? The more I think about it the more frightened I get. Aunt Daisy had a strange look in her eyes sometimes, quite like a person who had been, or might be, mad. I feel sure that she had some dreadful trouble to hide. I can't help thinking that she has gone away to destroy herself."

Mr. Stewart turned upon Myrrha savagely; but the girl looked so white, so scared, such a fragile, unstable creature, that, instead of the harsh words that rose to his lips, what he spoke was mere reassuring banter. Then he stood, perhaps ten minutes, contemplating his own hand apparently, seeing nothing, and thinking profoundly.

"What are you going to do?" asked Myrrha, when he moved.

"Going to do? I'm going to find her—to take care of her. She is not fit to be alone and in trouble. It is what you say, of how ill she looked, that makes me anxious; otherwise, of course, one would merely wait till she came home."

"Mr. Stewart, what shall I do? She told me to ask you."

"What shall you do? Why just stay here quietly till your Aunt Daisy comes back."

"She will never come back."

"Or, if you prefer to do so—if you think you will be lonely here—just return to your friends. That might be best—to return to your friends."

"I have no friends to whom I can return."

"Stay here, then, for the present. For the present, Myrrha, I have no thought to spare for your affairs."

"Of course not. I never expected you would have. I knew you would be far too much alarmed about poor Aunt Daisy."

"I'm not alarmed, but I'm anxious."

"She told me to do all I could to comfort you; but, of course, I know I can do nothing. And she said you would be kind to me."

"So I will be, by-and-by, when I've time to think about you. Good-by, now." And so he left her.

"He cares more for Aunt Daisy's little finger than for me, and all the world besides. And I do like him. And I love Redcombe. And I can't go home, and I won't go out as a governess, and what am I to do? What will become of me?"

And Myrrha burst into passionate crying. It didn't matter if she did make her eyes red and her face swollen; there was no one to see her, and there would be nobody; at which terribly pathetic thought her sobs and tears burst forth afresh.

Mr. Stewart, as he went away, thought to himself: "Of any woman but Daisy, acting as she acts, speaking as she speaks, one would have the most serious suspicions. But Daisy is, has been, and will be, Daisy."

CYCLOPEAN-WALLED TOWNS.

THE remains of the walls of a class of cities found in Italy, Sicily, Spain, Greece, and Asia Minor, called Cyclopean, or Pelagic, are of the highest interest to the antiquarian. They are made of huge blocks of stone, of from five to twenty feet in length, and mostly of a polygonal or parallelogram shape, put together without cement. As they are prehistoric, and have been in the condition in which they now are since the commencement of our historic period, they have caused much speculation with regard to their origin. Some have supposed them to have been made prior to the deluge; others, that they were built from about the year 2000 down to 1400 B. C. Louis Petit Radel, a member of the Institute of France, who devoted some forty years of his life to their study, was of opinion that they were made by the Canaanites, after they were driven out by the children of Israel, in 1491 B. C. These cities were very numerous, as more than four hundred have been figured and described. In Italy they are found throughout the central and southern parts. Most of

the principal hills east of Rome show substructions of this class of fortifications. It would seem that the time was when the whole population had to live crowded together in fortified towns, which, for ease of defence, were mostly built on the tops of thimble-shaped hills.

These towns carry us back, in imagination, to the time when that prophecy, perhaps the most improbable one that was ever uttered, was proclaimed by the prophet, that the time should come when every man would sit under his own vine and fig-tree, no one daring to molest or make afraid. We have seen the fulfilment of this prophecy on a larger scale in this country than in any other on earth, and it appears as though God has preserved these heavy substructions of ancient fortifications as a kind of landmark, to show the progress the world is making, through the influence of the Bible, to that time when the wolf shall dwell with the lamb, and the leopard shall lie down with the kid, and the calf and the young lion and the fawning together, and a little child shall lead them.

Even now, from habit or necessity, the people in the same parts of Italy where, 1500 B. C., they had to live in fortified towns, seem to have to do so still. The farming population all live in towns, and are careful to return home before sunset. It was a matter of surprise, especially the priests, that I dared travel on foot and alone, and be sometimes to until nine, ten, and eleven o'clock at night before I would reach a town. On one occasion, particularly, just at night, seeing a town some three miles ahead, I asked a peasant what inn I had best stop at. He replied: "There is one on this side of the town, but you had better go into the central part, as it is safer; never stop in the outskirts of a town, for it is not so easy to commit a murder in the crowded part."

Pliny says that, according to Aristotle, towers were invented by the Cyclopeans, and, according to Theophrastus, by the Tyrrinthians. The Scholiast of Statius pretends that every thing that was remarkable for its great size was said to have been formed by the Cyclopeans, and Lactantius observes that the ancients call all such edifices as are well-constructed, Cyclopean. The great difficulty, however, is to ascertain who the Cyclopeans were, whence they originated, and at what period they flourished. Strabo had as confused ideas about the Cyclopeans eighteen centuries ago as we have at present. He says they were a Thracian nation, and the best artists of the age in which they lived. They appear to have been particularly skilful in constructing military fortifications, and to have diffused their architectural knowledge throughout Greece and many parts of Italy, Sicily, and Spain. These countries were colonized by the Pelasgi of Greece, who learned the art of military construction from the Thracian nation; but it is more probable that the Cyclopeans themselves were the Pelasgians, who settled at a very early period in the Peloponnesus, for it is generally allowed that they were strangers and not aborigines.

It is of interest to observe how nearly the Romans adopted a similar mode of building. It seems as though they had taken from the Cyclopean walls the principle upon which they constructed their roads. There are fine specimens of these ancient roads in various parts of the Via Appia, and in the Triumphal Road to the top of Mount Albanus, in the Via Latina, Praenestina, Æmilia, Aurelia, and, in fact, in all the roads which led out of Rome. The irregular, polygonal shape of the stones, which form the Cyclopean wall, prevents any perpendicular motion of the great masses, and acts, although perhaps in a less degree, in the Roman roads, by preventing their being moved horizontally out of their proper place. Stones of the common parallelogram form would be much more easily deranged. The force of the shock and the action of the stones on one another, while any heavy vehicle passes over them, is diminished by the number of angles which act in different directions; and these polygonal blocks of stone are still more firmly kept together by heavy curbstones, which are placed edgewise on each side, throughout the whole extent of the road. Although these pavements of polygonal stone have been in use more than two thousand years, they are not in the least disturbed from the order in which they were placed. I speak of the pieces of road which have been suffered to remain.

There are four different styles of these Cyclopean walls recognized in Italy and Greece, and there appears to have been a regular parallel advancement of the arts of Greece and Italy in those remote ages. The reign of Perseus, for whom the Cyclopeans built the walls of Mycenæ in Greece, has been fixed at about 1458 B. C. In Italy, Cora was founded by Dardanus about 1423 B. C. Aaron had died in 1452, Moses in 1451, when the Children of Israel entered Canaan. Troy was founded in 1400. The walls of Mycenæ and Cora are similar in

their construction—they approach the parallelogram form—and this mode of construction ceased in Greece about the period of the capture of Troy, 1184 B. C., at which time Æneas sailed for Italy, and it is reasonable to suppose that it was discontinued about the same period in Italy.

We may trace, by the comparison of the different styles of Cyclopean construction, the regular advance of architecture, from the roughest and most irregular manner, to the most perfect symmetry. The most ancient Cyclopean walls that have been observed in Greece are those of Lycosura, in Arcadia, which, Pausanias says, "was the most ancient city in the world, the first the sun ever illumined with his rays, and that, from these venerable walls, men learned how to build cities." It appears to have had only one gate. The remains of the town are scattered round the Acropolis, and seem to have occupied a space of about two miles in circuit. The Acropolis appears to have possessed four edifices of the Doric order, of which the columns are of small proportions, and the capitals of very ancient form. The ruins of Ecetra, close by Signia, some thirty miles east of Rome, in the mountains of the Volsci, appear to have belonged to the same period. There are nothing but the remains of a very heavy, rude wall, which are like the first or earliest class of Cyclopean walls, and which appear the oldest of any I have seen in Italy.

Tyrius, on the plain of Argos, has no vestige of the town remaining. The walls enclose a space of about two hundred and forty-four yards in length, and fifty-four in breadth. Their general thickness is twenty-one feet, and in some places twenty-five. Their height, in the most perfect part, is forty-three feet. Hesiod and Homer mention the "well-built walls of Tyrius." Apollodorus and Strabo assert that it belonged to Prætus, for whom it was fortified by the Cyclopeans. Prætus is supposed to have reigned over the kingdom of Tirynthis about 1379 B. C. The walls of Tyrius are probably now nearly in the state in which they were seen by Pausanias, in the second century, for the town does not appear to have been rebuilt after its destruction by the Argians, about 468 B. C. The great strength and extraordinary bulk of these walls induced Pausanias to compare them to the Treasury at Orchomenos, and to the pyramids of Egypt. The walls, when entire, were probably not less than sixty feet in height. There is a pointed gate, whose form bears perhaps the most ancient resemblance to that of the Gothic arch. It is seven feet ten inches broad at the base, and nine feet high, but is considerably lowered by the accumulation of earth. It is composed of approximating blocks. There is another gate, of the same kind, in the Acropolis. One of the gates of Mycenæ is of a similar shape, and other examples are found near Missolonghi in Ætolia, and at Thoricus, in Attica. There is a beautiful one in the walls of Arpinum, and another at Signia, in Italy. The architects of this period constructed no round arches which have come down to us. There is one of these pointed ones in the ruins of an aqueduct in old Tusculum, near Frascati.

The walls of Tyrius and Mycenæ constitute the finest Cyclopean remains that are to be seen in Greece; but these are inferior to the more stupendous structures of Norba, in Latium, which was a Pelasgic colony, and of Signia, Ferentinum, Alatrium, and Arpinum.

It was the opinion of the Greeks that Mycenæ was founded by Perseus, the brother of Prætus. The walls were said to have been erected by the Cyclopeans, who raised the walls of Tyrius. The city was destroyed by the Argians, about 468 B. C.; but the strength of its walls defied their powers of demolition. The walls which remain are of the rough style and of the more improved construction, composed of hewn and well-compacted polygons. This characterizes the second style of Cyclopean masonry. Of the earlier styles, few remains are observable at Mycenæ. Pausanias, in his description of Mycenæ, says: "A part of the peribolos of Mycenæ still remains, and a gate upon which are lions. These are said to be the work of the Cyclopeans, who built the fortress at Tyrius for Prætus." This gate probably remains in the condition in which it was seen by Pausanias. It formed the principal entrance to the Acropolis; but it is at present rendered impassable by accumulations of stone that are piled up nearly to the lintel. Its breadth at the top is nine feet and a half. The lintel is fifteen feet and a half in length, six feet eight inches in breadth, and four feet in thickness. The stone on which are the sculptured lions is twelve feet broad at the base, and nine feet ten inches in height; its general thickness is two feet. The street which leads to the gate is thirty feet and a half in breadth. The lateral walls are nearly regular in their construction, while those which con-

stitute the peribolos, or circuit of wall, are formed of irregular polygons. They are composed of hard, compact breccia, procured on the spot; but the block on which the lions are sculptured is a green marble.

Pausanias says that the subterraneous chambers of Atreus and his sons, in which they kept their treasures, were among the ruins of Mycenæ, as also the sepulchres of Atreus, and of all those who, together with Agamemnon, were treacherously slain by Ægistheus after their return from Troy. Pausanias does not enter into a description of the Treasury of Atreus; but his account of the Treasury of Minyas at Orchomenos, in Bœotia, will also apply to that of Atreus at Mycenæ, which is still entire. He says it is of a circular form, with a ceiling terminating in a point, but not acuminated, and that it was one of the wonders of Greece. A space of twenty feet in breadth, between two parallel walls, leads to the Treasury of Atreus. The entrance is nine feet and a half wide at the base, and seven feet ten inches at the top, and about nineteen feet in height. It leads, by a passage of eighteen feet in depth, contrived in the solid mass of the wall, to the subterraneous circular apartment, which resembles a Gothic dome, and is concentrated in a key-stone at the top. The Treasury of Minyas was of larger dimensions than this of Atreus; it was of white marble, while this of Atreus is of a hard, beautiful breccia, cut upon the spot. The whole front of the edifice appears to have been sumptuously embellished, and bears many striking lineaments of the Egyptian style.

The interior form of the Treasury is that of a Gothic dome. Its present height is forty-nine feet, but the earth is raised above its ancient level. Its diameter is forty-eight feet. The stones are all parallelograms, and placed in regular layers, of which thirty-four are exposed to view. They are united with the greatest precision, without the aid of cement. The stones are not of equal dimensions, but the layers are generally about two feet in thickness. This edifice consisted of two chambers; a door leads from the first into the second, which is a square of about twenty-seven feet, and about nineteen in height in its present state; the present height of the door is nine feet and a half; the breadth at the base, four feet seven inches, but at the top four inches less. It has a triangular cavity over the lintel, similar to that over the portal of the great chamber, and to that over the gate of the lions.

The thickness of the walls of this edifice is eighteen feet. The lintel of the great portal is composed of two masses of stone, the largest being of the dimensions of twenty-seven feet in length, seventeen feet in breadth, and three feet nine inches in thickness, weighing about one hundred and thirty-three tons. No single masses, except those of Egypt and Baalbec, can, in point of magnitude, be compared with this stupendous stone. It is of breccia, like the rest of the building. The interior of this edifice was decorated, which is seen from the great numbers of long bronze nails which are still found in it, even to the roof. These nails have large heads, and project about one-third of the way.

Three styles of early construction are visible in the walls that enclose the Acropolis of Orchomenos. The rough Tirynthian style is seen only in a few places; the polygonal is predominant, and the walls appear to have experienced at least two overthrows.

The most ancient citadels of Greece and Italy were not only used for the defence of the inhabitants, but as a protection for their flocks, which in the most early periods constituted their principal wealth. Prisons, large cisterns, granaries, treasuries, and Grecian theatres, were also excavated in the solid rock both in Greece and Italy.

Signia was an ancient town of Latium, about thirty miles east of Rome, on the spur of the Volscian Mountains, about twelve hundred feet above the plain. The modern town, of about three thousand five hundred inhabitants, occupies a part only of the site of the ancient city. The latter embraced within the circuit of its walls the whole summit of the hill, which stands boldly out from the Volscian Mountains, with which it is connected only by a narrow neck. The line of the ancient walls may be traced throughout its whole extent. The place is one of the most remarkable specimens of the Cyclopean or Pelasgic cities in existence. And yet, how many of all the Americans who have visited Rome have even seen or heard of it? The city had five gates, two of which retain their primitive construction; and one of them, known as the Porta Saracenica, presents a remarkable instance of the rudest and most massive Cyclopean construction. The architrave is formed by single masses of stone, not less than twelve feet in length, laid across from one impost to the other. The

other of the two gates was similar in style. There are, within the circuit of the walls, the remains of a temple, now converted into a church of San Pietro, of Roman date, and built of squared blocks of tufa, and, close by, a fine circular reservoir of water, lined with the *opus Signinum*. There are several inscriptions of imperial date preserved in the modern town. The temple shows the work of three different ages in its walls. On entering this church, I asked my *cicerone* who was the protecting saint of the town, and he replied: "St. Bruno;" and he went on to speak of his faithfulness, and gave as an example:

"After Garibaldi had defeated the King of Naples, in 1849, at Velletri" (which was, but a few miles distant, in sight), "he" (Garibaldi) "tried for eight days to find his way into Signia; but he failed, because St. Bruno threw dust in his eyes."

I afterward told Garibaldi of this, at which he smiled.

Nosba, without an inhabitant, presents in its existing ruins one of the most perfect specimens of Cyclopean walls. A great part of the circuit of the walls is entire; without regular towers, the blocks are mostly polygonal limestone, though the principal gate is flanked by a rude projecting mass which serves the purpose of one, and on the east side there is a great square tower or bastion, projecting considerably in advance of the general line of the walls. Its position is one of great natural strength. It stands on the brow of the Volscian Mountains, some fifteen hundred feet above the Pontine Marsh. A history of Latium, which I met with in a convent on Mount Albano, on the site of the old temple of Jupiter Latiaris, states that, when the Romans conquered this town, the people set fire to every thing that would burn, and then threw themselves into the flames. The site of Nosba is fine, and commands a most extensive and superb view of land and sea.

In numerous instances, as at Ferentinum, the Pelasgic or Cyclopean wall is the foundation upon which the early Latins built, and upon this the Goths. The style of building determines the age in which each particular kind of wall was made, and the people who did it.

The cities of Arpinum, Alatrium, Ferentinum, and Alba, like Signia and Nosba, are each worth a voyage across the Atlantic to see. Upon all these structures, history throws no light, and all that we can know for certain is that the architects of those distant days possessed science and genius which have not been surpassed in later times.

L. G. OLMSTEAD.

"WAITING FOR AN ANSWER."

WITH ILLUSTRATION, PAGE 153.

DARK, drooping eyes in dreamy glory;
Dear, fluttering heart so kind and true;
Fair page whereon is writ the story
Forever old, yet new!

All in a mesh of dreams entangled:
Oh, breathe thy words of rapt delight,
Sweet lips—twin petals of the rose bespangled
With diamond dews of night!

No longer o'er thy distaff leaning,
To one lone, longing heart that waits,
Thy message send of deepest meaning,
Thou kindest of the Fates!

Without, the happy birds are singing
Their last song in the gathering gloom;
And languorous airs soft scents are bringing
From musky buds and bloom.

Still rapt within thy dreams entrancing;
Still toying with yon necklace fair;
Still drooped thine eyes, nor ever glancing
Up from that page, so fair.

Oh, gentle word of all completeness!
Of tender grace and loveliness!
Fair messenger, with all thy fleetness,
Bear thou her answer—"Yes!"

GEORGE COOPER.

CENTRAL SOUTH AFRICA AND ITS EXPLORERS.

II.

WITH a brief sketch of some of the more eminent of the explorers of this region, we close this paper. Of Dr. Livingstone, who, in his earlier explorations, several times crossed this belt, discovering, in one of his journeys, the beautiful and grand Victoria Falls of the Zambesi, we have no need to speak. His history is indelibly fixed in the minds of all our readers. That he may accomplish successfully his present long and perilous expedition, and either emerge on the west coast or among the upper streams which compose the Nile, we, in company with all his friends, earnestly hope. No man living has passed through greater dangers, or encountered them with greater intrepidity. Long may he live, and realize the full fruition of his toils in the destruction of the slave-traffic, and the elevation, civilization, and Christianization of Africa! The missionaries Hahn, Rath, Scheppmann, and Baur, have spent many years in Damara-Land, and have become familiar with the country and its inhabitants. Rev. J. Hugo Hahn, who is a Russian by birth, but a missionary of the Rhenish Missionary Society, has resided in or near Damara-Land (having, in the commencement of his labors, established a station at Eikhams, the Kraal of Jonker Afrikaner, in the borders of Namaqua-Land) for about thirty years. He and his son, Mr. Josaphat Hahn, who was born in this part of Africa, have, during the past year or two, communicated to the German geographical journals very full and interesting descriptions of the soil, geology, mineral, vegetable, and animal productions of the country of the Damaras, and a careful account of the origin, history, habits, manners, customs, religion, and government of the Ova-Herero and Ovambo. The task of the missionaries, especially in the present condition of the Ova-Herero, is a difficult one, and their success, notwithstanding their assiduous and faithful labors, has not been great. The people seem, as a general rule, to be unimpressible by any of the considerations of religion—as impervious to moral impressions as a rhinoceros is to a musket-shot. They are very willing to be fed and supported by the missionary; but, as for his doctrine, they give no heed to it. The Makololo and Matabele, among whom Dr. Livingstone and several of his associates have labored with great assiduity, are almost as unimpressible. This is not due to any want of intellectual perception, for all these people are quick-witted enough, but to a moral obtuseness, which wards off religious truths, and perhaps, in part, also to an intense fondness for show and display, be it ever so tawdry. The Gospel is too plain, simple, and severe, for their tastes. Whatever may be the cause, the fact remains that the labors of these devoted missionaries among the Zingian tribes of the African Continent have met with but very little success.

Among the most eminent and successful elephant-hunters and explorers of Central South Africa have been Frederick Green, Francis Galton, Charles John Anderssen, James Chapman and his brother Edward, Mr. Baines, Carl Mauch, and, somewhat earlier, Mr. Harris and Roualeyn Gordon Cumming. Of these, Galton and Anderssen (whose journeyings in this country were confined to the region from Lake Ngami to the west coast), the brothers Chapman and Baines (who traversed nearly the whole breadth of the continent), and Harris and Cumming (who only visited the central portion), published narratives of their travels; Mauch, the latest and most scientific of all the explorers, has given, in Petermann's *Mittheilungen*, a condensed account of his recent discoveries.

Mr. Galton was a gentleman sportsman of fair education, but without any particular scientific tastes; but Anderssen, who accompanied him in his first journey to Damara-Land, and who subsequently returned there, and spent the greater part of seventeen years in that region, dying there in January, 1868, was a man of considerable scientific attainments and of great energy and force of character. Charles John Anderssen was born in Sweden, about 1815. His mother was of English birth. From his earliest youth he was fond of adventure, and, while acquiring his education, devoted much attention to field-sports and the pursuits of natural history. It had been, from his boyhood, his earnest desire to visit and explore Africa, where he might indulge to the full his love of hunting, his tastes for natural history, and his fondness for adventure and discovery, but the great expense of such

an undertaking had deterred him. In 1849 he visited England, bringing with him a considerable collection of living animals, and specimens of natural history, which he had accumulated in his hunting-excursions in his native country. He was desirous of disposing of these, in order to obtain the means of making an ornithological survey of Iceland. He had nearly completed his arrangements for this purpose, when he made the acquaintance of Mr. Galton, who asked him to accompany him to South Africa, and offered to defray all the expenses of the undertaking. He accepted the liberal offer, and the two friends reached Cape Town, June 24, 1850, and Walfisch Bay, on the western coast, on the 20th of August. For the next two years they explored Damara-Land in company, not very successfully, when Mr. Galton returned to England, and published a narrative of his travels. Anderssen remained in the country two years longer, penetrated to Lake Ngami, and in 1854 returned to England and published his "Lake Ngami Wanderings in Southwestern Africa." The book achieved a great success, and, supplied by its sale, and by the proceeds of his hunting, with the means for further exploration, he soon returned to Africa, revisited Lake Ngami and the River Tiouge, and, returning to Cape Town, sailed for Walfisch Bay, and again, in company with Frederick Green, undertook the exploration of Damara-Land, in the hope of finding and tracing the course of the Cunene River. He was unsuccessful in this, and suffered terribly, being nearly killed by an elephant he had wounded, separated from his friend, and in great peril of being murdered by hostile natives, and finally, after having discovered and explored for a considerable distance the Okovango, a large and perennial stream, which probably flows into Lake Ngami from the northwest, was attacked with the jungle-fever, from which he suffered for many months, and narrowly escaped death. The results of these expeditions were given to the public in his "Okovango River." Having disposed of his ivory, etc., at Cape Town, Mr. Anderssen returned in 1861 to Damara-Land, and, finding that the Namaquas, under Jonker Afrikaner, were plundering the Ova-Herero, his sense of justice and righteous indignation was so thoroughly roused, that he proposed to take the command of the Ova-Herero and lead them against the invaders. There was too little unity of purpose among the tribe to make such a proposition practicable; but, gathering a band of the boldest of them, with his own servants, he attacked the Namaquas, and defeated them in several engagements; in the last of these he was severely wounded, and, no surgical aid being obtainable, he undertook the voyage to the Cape in a sailing-vessel, and, though undergoing severe tortures with his wounds and shattered bones, he was landed at Cape Town, submitted to the operations necessary, and, after some months, recovered so far as to be able to return to Damara-Land. He now purchased a large herd of cattle, and, driving them to the neighborhood of Ondonga, in the Ovambo country, settled down on a cattle-farm. He had married some years before, and his family were with him. After two or three years of prosperity, his old enemies, the Namaquas, made a raid again into his vicinity, and captured the greater part of his cattle, and those of some of the Ovambos. He pursued them, attacked them, and recovered most of the plunder; but, on his way home, weakened and broken down with fatigue, and the opening afresh of some of his wounds, he was attacked by the jungle-fever, and died after a few days' illness. The native tribes have a superstitious horror of death, and Nayuma, the king of the Ovaquambi, who was with him, fled with all his people, and would not consent that the body of the brave hunter should be buried on his territory. Anderssen's faithful servant, Axel Ericksen, a Swede by birth, though himself weak from illness, bore his master's body off to a favorable position, dug a grave with an axe and a tin dish, and buried him. The native chiefs seized Anderssen's effects, but Nayuma had the grace to have a monument of thorn-trees and ox-horns erected over the grave to keep the hyenas away.

Mr. James Chapman is an English gentleman, now in the prime of life (he was born in 1831), who has spent nearly seventeen years in Central South Africa, hunting and exploring. He possesses a fine fortune, and is an accomplished naturalist. He has made several journeys from Walfisch Bay across the continent to Lake Ngami, to the Kraals of Lechulathebe and Sekeletu, to the *Eitroctoe* or salt-pans, the bed of a former lake, now covered with salt and sulphates of soda and magnesia, to the falls of Zambesi, of which he obtained several very fine photographic views, and to Mosilikatse's capital. He had not, when last heard from, succeeded in reaching the east coast, as another young and daring adventurer has since done, by descending the Limpopo.

Mr. Chapman is a good observer, and a brave and daring traveller, and has made many valuable contributions to science; but these have been, for the most part, rather in the direction of natural history and ethnology than of geography. His two volumes of travels give a very clear and simple picture of the hardships of the life of the traveller and hunter, even under the most favorable circumstances, in this terrible wilderness; yet, strange as it may appear, like all the rest, he seems fascinated with this roving life, and willing to forego all the delights of civilization, and of the society which he is so well qualified to adorn, and to prefer the perils of the wild, the association with dirty, gluttonous, and treacherous savages, and the pursuit of wild beasts. It is a strange taste, but to it science is indebted for some of its greatest discoveries and its most remarkable trophies. In these journeyings, Mr. Chapman has at different times been accompanied by the missionary Rath, by Mr. Frederick Green, by his brother Edward, and by Mr. Baines, the artist.

It had been satisfactorily ascertained some years since by Livingstone, Green, Anderssen, and Chapman, that the elevated plateau which crosses the continent, about south latitude 19° , and forms the water-shed between the Limpopo and Zambeze, throwing a long spur southward about the twenty-eighth meridian of east longitude from Greenwich, was primitive in its character, being formed, where

ever the rock is exposed, of granite, gneiss, porphyry, or basalt. At the Victoria Falls, on the Zambeze, one of the most remarkable cataraacts of the world, the hard basaltic rock forms the walls of the precipice. Livingstone had heard of golden sands being brought down to the Zambeze by some of its tributaries; and there were reports that, many years ago, there had been mines of the precious metals somewhere near the east coast. The information on this point was, however, vague and indefinite, and Livingstone was not inclined to attach much importance to it.

It remained for a German geologist, Carl Mauch, a native of Würtemberg, to discover the third of the three great gold-fields, which has been opened to human industry and enterprise in our time.

Mr. Mauch, who is, we believe, a graduate of the Freiberg School

of Mines, sailed from Trieste, for South Africa, in 1863, and, after spending some time in Cape Town and Natal, visited Potchefstroom, the capital of the Transvaal Republic, and, having made the acquaintance of Pretorius, the president of that republic, made a rapid but tolerably complete geologic and geognostic survey of the state. During this work, which occupied him the greater part of 1864, 1865, and the early months of 1866, he formed an intimacy with Mr. Hartley, a famous elephant-hunter of the Transvaal, and his sons, and agreed to accompany them, in one of their hunting-expeditions to the north, ostensibly for the sports of the chase, but really to explore the geology, mineralogy, and natural history of the country. His first expedition was made in

the latter part of 1866 and the beginning of 1867. Setting out from Potchefstroom, July 27, 1866, they journeyed nearly due north, for about two hundred and fifty miles, following, for much of the distance, the banks of the Crocodile River, an affluent of the Limpopo. On the Tropic of Capricorn they turned to the northwest and ascended to the southern spur of the elevated plateau of which we have spoken, which here, as well as elsewhere, forms the water-shed between the Zambeze and Limpopo, though nearer to the latter. Following this plateau, for a distance of about four hundred and fifty miles, passing through Mosilikatse's kraal, and, proceeding north of it, they entered a rough, rocky country,

which abounded in game. Mauch made the best use of his eyes possible, and obtained the bearings by means of a pocket-compass; but Mosilikatse was intensely jealous and suspicious of the traveller, and prohibited him from making any notes, or using any instrument for taking observations, or making any collection of mineral, vegetable, or animal substances. The travellers were, during their entire stay in his dominions, constantly dogged by Mosilikatse's spies, who became at last insufferably insolent; and, having reached the Fole, one of the larger affluents of the Zambeze, they were compelled to turn back, in order to rid themselves of this annoyance. Mauch had made himself familiar with the vegetable and animal productions of this region, and, from numerous indications, had become convinced that there was gold in some of the quartz-veins

CHARLES JOHN ANDERSSSEN.

which occasionally came to view on their route, but the impossibility of bringing away any specimens prevented the completion of his discovery. Having returned to Potchefstroom in the winter of 1866-'67 he determined to attempt the exploration of this region from another direction, which would not involve a passage through Mosilikatse's kingdom. His friend Hartley offered to guide him by a route farther east, toward a district which, from his account, seemed to have formerly been the seat of extensive mines. In the spring of 1867 the second expedition set out from Mr. Hartley's farm, in the eastern part of the Transvaal Republic. They proceeded north to Zutpansberg, near the Meket, a tributary of the Limpopo, and, crossing the latter river, skirted the eastern base of the hills whose summit they had traversed in their previous journey. Much of this region is infested by the tsetse-fly, and they were obliged to take many precautions to avoid the loss of their teams. Their first discovery of gold was made near the banks of the Chascha, one of the northern affluents of the Limpopo, not far from its northwestern bend. Here they found a number of holes excavated in the quartz-veins; and rude mining-implements, evidently the tools of a savage race of remote times, lay around. Breaking with his hammer some pieces of the quartz from the mass, Mauch found grains of gold thickly disseminated through it, and the sands of the river also contained particles of gold. Having definitely fixed the location of this deposit, Mauch and his friends proceeded northward to the Tuti River, a mountain-stream tributary of the Limpopo. Here at an elevation of nearly seven thousand feet above the level of the sea, they found a still more extensive deposit of gold, which had apparently never been worked. After obtaining specimens of this, they went forward; and nearer the Zambeze, about one hundred and sixty miles west of Tete, a Portuguese settlement on that river, a third gold-field was discovered, which bore evidence of having been worked imperfectly by the Portuguese in the seventeenth century. After a careful survey of the three fields, Mauch and his companions returned to Potchefstroom, and thence, in the winter of 1867-'68, he proceeded with his specimens to Natal, and later to Cape Town. The excitement which these discoveries produced at both these places was almost as great as that caused by the announcement in New York of the gold discoveries in California, in 1848, or in Melbourne of the Australian deposits, in 1851. Mr. Mauch published a map of the gold districts and the routes leading to them, in the spring of 1868, and hundreds of companies were formed, both at Natal and Cape Town, to go to the gold-regions. The distance overland from the Cape was from thirteen to sixteen hundred miles, and, from Natal, from eight to eleven hundred miles; and there seemed to be no other feasible route. The journey from Natal was shorter, but the companies from the Cape traversed the whole distance in wagons.

In July, 1868, Mr. St. Vincent Erskine, son of the colonial secretary at Natal, undertook to descend the Limpopo, and ascertain where it entered the Indian Ocean, and whether there were any obstructions at its mouth or in its lower course. Repeated attempts had been made to find the entrance to the river, but all had hitherto proved unsuccessful. Mr. Erskine made Leydenburg, a small town in the eastern part of the Transvaal Republic, his starting-point, and, late in July, marched directly thence to the junction of the Oliphant River with the Limpopo, and, embarking in a boat at that point, descended to the ocean, finding the river without serious rapids or shoals, and, unlike most African rivers, with no delta or malarious marshes at its mouth. He regards it as navigable for steamers of good size to the mouth of the Oliphant River, and perhaps higher. Its embouchure into the ocean is near Inhampura, and so considerably farther south, and nearer Natal, than geographers have supposed. When communication by steamer with the country in the immediate vicinity of the gold-fields is once established, this region will be even more accessible than most of the gold districts of Australia.

It is not easy to predict what will be the effect of this discovery, and of the still more recent discovery of diamonds in the adjacent region, on the future exploration of Africa. The towns and villages which will inevitably spring up in the gold-region, peopled, as they will be, mainly by Europeans, will be valuable advance-posts in the hitherto unexplored territory, from which travellers can go forward into that vast tract which now is more entirely unknown than any portion of our globe. From the east and the west, from the north and the south, the lines of discovery are approximating, until we may hope, ere long, to have a map of Africa on which there shall be no broad territory

branded as "unknown," and the young and daring spirits of England and America will be obliged to seek for new and untried sensations in the centre of Asia, of South America, or on the Arctic or Antarctic Continents.

L. P. BROCKETT.

THE EGYPTIAN GENTLEMAN AT HOME.

BY THE ROVING AMERICAN.

VI.

AS A PUBLIC MAN.

THUS far we have attempted only to describe the life of the private Egyptian gentleman, who lives at ease on his income, and literally "kills time" without utilizing it. But this is a very small class—smaller in Egypt than in most countries—owing to the absence of any hereditary aristocracy outside of the reigning family, and the rapid mutations of position and fortune under the rule of a dynasty more absolute than that of Russia. The mere whim of the viceroy may make the pipe-bearer of to-day the high public functionary of to-morrow, and reduce the pompous pacha to the condition of the exile and beggar with equal promptitude. "Life, liberty, and the pursuit of happiness," defined by our highest authority as "inalienable rights," are found to be very easily alienated in the East, and, under most of the previous reigns in Egypt, have been held by a most uncertain tenure.

Commerce is not regarded as an employment suited to the Eastern gentleman; and law, medicine, and literature, do not rise to the dignity of professions in a country whose interpreters of law are the *ulemas*, or priests; whose medicines are locks of hair placed on saints' tombs; and where professional doctors are unknown, and whose chief literature is of an oral description, derived from two books, the "Koran" and "The Thousand-and-one Nights."

Public life, therefore, is the ambition, and office-holding the occupation, of nine out of ten of the Egyptian gentlemen; and it is made to pay as well as in this country—not by the salaries, which are small, but by the "perquisites," which are infinite. Indeed, this is so well understood, that Mehemet Ali, having accidentally taken a fancy to that *rara avis*, a really conscientious man, and, having elevated him from a lower post to a higher one in the custom-house on his plea of insufficiency of pay in the first, lost all patience on being the third time importuned for another change on the same pretext.

"I know well," said the irate viceroy, "that the salary is small, but two of your predecessors in the same place are now men of fortune. If you are such an *homan*" (ass) "as not to be able to profit by it in the same way, you deserve to starve."

The man took the royal counsel, dropped his scruples, and grew as rich and "respected" as some of our public characters here who adopt the same code of ethics.

The temptations to abuse trusts confided to them are greater there than here. In the first place, there is no responsibility to a public, which does not exist in those communities, and where publicity through the press is not to be feared, even did anybody read the few journals published in the Ottoman dominions. Secondly: the office-holder retains his office by the uncertain tenure of his viceroy's, or superior's, will or caprice, and, therefore, must "make hay while the sun shines." Thirdly: he knows that everybody, from the grade immediately below the viceroy, accepts "presents"—in other words, plunders those immediately below him, ending with the *sheik el valier*, or sheik of the village, who bastinadoes the soles of the feet of the miserable *fellahs*, or peasantry, until the torture extracts the last copper *para* out of their mouths, where they have concealed it in the hope of holding out long enough to save it. The great vice of all Eastern administrations hitherto has been bribery, known by the euphonious name of "bakshish," or presents, with which the inferior buys justice, or forbearance, or the possession of his own, from persons in authority.

Whether, among his new reforms, the enlightened prince, who now rules over Egypt under the new title of Khédive, is attempting to introduce this, the Roving American cannot say; but he does know that his predecessor, Saïd Pacha, did essay that experiment, and broke a brave and loyal heart in trying to change, like Aladdin, his old lamps

for new. Every Egyptian gentleman, therefore, on arriving at years of puberty—say sixteen—turns his attention to two things—establishing his harem by getting a wife, and procuring an office with good appointments and prospective bakshishes.

The first matter gives him personally no trouble. Courtship and flirtation, or making one's self agreeable to the "object of affections," are impossible in a state of society where such object is invisible, as well as all other feminine objects, except one's mother and grandmother, and disreputable *gawazhie*, or dancing-girls, of most unequivocal character.

The wife is sought for and provided by his female relatives, and he has to take her on their description, and by their inventory of her charms of mind and person. All the trouble our Egyptian gentleman has before marriage is on the day preceding and on the wedding-day, when the fantastic marriage-festivals are in course of celebration, and he beholds his almond-eyed gazelle for the first time when he lifts her veil in the bridal-chamber, the illimitable resources of the photograph even being denied him.

So his harem is provided for, and, whatever his troubles may be after marriage, its sacred veil usually conceals them from the world. So let them also be sacred to us, consoling ourselves with the thought that not even Indiana can boast of greater facilities for release from the conjugal yoke, or Utah for many wives, than the land of Moses and Rameses. The Turk may have four legal wives all at once, and, with the great facilities for divorce, a man who lives to a good old age may equal the patriarchs or King Solomon, even in these degenerate days, and convulse the soul of our own Brigham with emotions of envy. Mr. Lane had a highly-respectable friend at Cairo, who had rejoiced in eighty different wives during his very-much-married life of sixty years.

So our Egyptian friend has no difficulty on the first head. The second requisite for respectability, viz., the official position, costs more trouble, unless the young man have influential relatives, or is befriended by some important person near the viceroy or one of his high officials—say by the barber or eunuch of some high personage, these being the confidential retainers.

The barber, who every morning takes between his knees the head of the personage, soaping it softly over and shaving it as smooth as a billiard-ball, that the turban (or fez) may "gird the shaven brow," is probably the most influential, and has more opportunities of approaching familiarly the great. But the eunuch, who is also a person of great trust, having in charge what is supposed to represent the heart of the personage, is a most valuable ally in all ambitious aspirations, and, being as covetous as he is cruel, can be won over by "bakshish kitter"—liberal largess.

Any outside influence brought to bear on the harem also, such as that of the *dellabs*, or saleswomen to the harems, tells; for Eastern men are much influenced by their wives, who love political as well as amorous intrigue—possibly because they see so little of them. Through some one of these back-door influences our Egyptian passes into office, and the guiding principle he carries into it is to utilize it to the greatest extent in the shortest possible time, and to do as little as he safely can for his salary. In these two particulars, it strikes the Roving American, after a lengthened absence from his native land, that the Egyptian spirit and practice are not altogether unknown even in this republican land.

But your Eastern office-holder differs from your Western in some important items. Thus he makes no loud pretensions as to public virtue, nor adds hypocrisy to his other vices. It is true he accepts and pockets his bribe under the name of "present" (bakshish), but why need we use an ugly name for an agreeable thing? and he never pretends that it really is any thing but a bribe, and feels in honor bound to give value received for it.

It has been truly as well as wittily said that there were seventeen kings in Egypt, viz., the viceroy, fifteen foreign consuls-general, and one greater than all combined, King Bakshish, who rules "the court, the camp, the grove," in the East, as well as in some small and remote countries of the West—of course, where our own bird of freedom never soared or screamed, and far, far remote from the sacred soil which bears the hallowed name of Washington!

Office-hours in the East are very irregular, except in some few of the government departments, where rigid rules are necessary; but punctuality, order, method, and red-tape, are sadly wanting everywhere.

The office itself into which you are ushered is usually a bare, unfurnished room, in a barrack of a building, with dirty, slipshod Copts and Syrians in their long black robes, with pen and inkhorn thrust in at their girdles, shuffling about in their red slippers from room to room. They are the chief clerks and accountants in Egypt, posts which the Turks and other natives are too lazy and too ignorant to fill.

Where it is not necessary for a high official even to know how to sign his own name to documents, a duty which he performs with his seal-ring and a little Indian-ink, why should he trouble himself with the three R's of Alderman Curtis, "Reading, riting, and rithmetic?" Accordingly, very few Egyptian gentlemen of the old school did trouble themselves to acquire those accomplishments, although the new school of Egyptians, under the more enlightened rule of the two last viceroys, has been educated at London and Paris, and numbers many cultivated men in its ranks. Nubar Bey, the Reschid Pacha of Egypt, can read, write, and speak, with equal fluency and precision, almost every European language, and many of the younger Egyptians, such as Halil Bey, Loutfy Bey (whose wife is a New-Yorker), are equally well instructed. Yet still the great majority of the high functionaries are not educated men, a superficial smattering of French being their chief educational acquisition, and their ignorance of all foreign topics marvellous to witness. Ismail Pacha, the present Khédive, himself a well-educated man, is striving hard to bestow the blessings of education on his people, but it is up-hill work, owing to native apathy and reverence for old usages among the masses.

Let us follow one of these Copt accountants, and enter an office. There is only a small divan in one corner, covered with chintz, on which are piled, in great confusion, a number of long slips of paper covered with Arabic writing. Squatted in one corner of the divan is a portly figure, pipe in hand, stamping with his seal-ring these strips of paper, which the Copt clerks hand him, seldom taking the trouble even to glance at their contents, and sinking back with a grunt of satisfaction when his arduous duties are completed.

He rises when you enter and are presented to him, courteously salutes you, and seats you by his side, sweeping a mass of papers on the dirty stone floor, to make room for you, and, immediately ordering fresh pipes, serenely smokes with you as long as you choose to remain, without troubling himself about his business avocations.

In the judicial functions more energy is displayed, and substantial justice often awarded, where King Bakshish does not intervene.

I believe the stranger and the poor man really have a better chance in a Turkish court, under a native *cadi*, than under more imposing forms in the West. But the "dignity of the court," in so far as outward appearances go, is not preserved at all, and an almost ludicrous familiarity seems to preside over the discussions between the judges and the culprits brought before them, who bawl out vociferously their pleas in *propria persona*, without the intervention of an advocate.

The judicial function in the East, except as connected with some other official position, such as chief of police, or governor, is not rated very high, nor attains the dignity it does with us. Places which bring the possessor near the person of the sovereign rank higher, and are more prized, the government being purely a personal one—an Eastern Caesarism, pure and undefiled.

One of the most marked results of office-holding there is precisely the reverse of what happens here, and that is, every office-holder grows portly and fat, and the longer he remains in office the larger he looms up before the public gaze. Whether it be that their perquisites are more nutritious, or their consciences less troublesome than in other climes, the Roving American deposeth not, but states the fact as a curious one.

But already the Roving American, though his experiences in that clime were recent, begins to recognize that in Egypt, as elsewhere, the "good old times" are giving way to the new, which do not seem quite so good.

Now that the familiar viceroy is transmuted into the Khédive, with American officers organizing his army, and Cairo rejoices in the apparition of a Parliament of Notables in baggy breeches and fez caps, who is there that does not begin to fear for the disappearance of the distinctive East—the East of our boyhood, the fairy realm of Haroun el Raschid, and of "The Thousand-and-one Nights?" To seize and photograph these dissolving views, which still live in his memory and heart, is the purpose of these sketches by the Roving American.

I.

THE Falls of Niagara and the Natural Bridge are justly esteemed the most remarkable curiosities in North America. So exceptional is the beauty, mingled with sublimity, of these famous scenes, that thoughtless persons have characterized them as "freaks of Nature." But in Nature—great, bene-

ficient, and doing all things in order—there are no freaks. She shows her power in the grand cataract, spanned with its rainbow, and in the dizzy arch of the Natural Bridge, as in the daisy and the violet she shows her grace and beauty.

The Natural Bridge, the character and formation of whose upper portion are displayed in the first of the accompanying sketches, has been, from about the middle of the eighteenth century, an object of curiosity and admiration in Europe as well as in America. Whatever traveller came to the Western World, to compare its natural grandeur with the grandeur of art and architecture in the countries he had left, went first, in the North, to the Falls of Niagara, and, in the South, to the world-famous bridge. Among these may be mentioned the courtly and distinguished Marquis de Chastellux, major-general in the French Army and member of the Institute, who in 1781 visited the place, and from whose rare volumes we present a few paragraphs which may interest the reader:

"Having thus travelled for two hours," writes the marquis, "we at last descended a steep declivity, and then mounted another. . . . At last my guide said to me: 'You desire to see the Natural Bridge—don't you, sir? You are now upon it; alight and go twenty steps either to

the right or left, and you will see this prodigy.' I had perceived that there was on each side a considerable deep hollow, but the trees had prevented me from forming any judgment or paying much attention to it. Approaching the precipice, I saw, at first, two great masses or chains of rocks, which formed the bottom of a ravine, or, rather, of an immense abyss. But, placing myself, not without precaution, upon the brink of the precipice, I saw that these two buttresses were joined under my feet, forming a vault of which I could yet form no idea but of its height. After enjoying this magnificently-tremendous spectacle, which many persons could not bear to look at, I went to the western side, the aspect of which was not less imposing, but more picturesque. This Thebais, these ancient

The arch is not complete; the eastern part of it not being so large as the western, because the mountain is more elevated on this than on the opposite side. It is very extraordinary that at the bottom of the stream there appear no considerable ruins, no trace of any violent laceration which could have destroyed the kernel of the rock and have left the upper part alone subsisting; for that is the only hypothesis that can account for such a prodigy. *We can have no possible recourse either to a volcano or a deluge, no trace of a sudden conflagration or of a slow and tedious undermining by the water.*"

The point here touched upon is one of the most interesting, in a scientific view, connected with this famous curiosity. The marquis, it will be seen, declares his conviction that the "prodigy" was neither

VIEW OF THE NATURAL BRIDGE, VIRGINIA.

pinces, these enormous masses of rocks, so much the more astonishing as they appear to possess a wild symmetry, and rudely to concur, as it were, in forming a certain design—all this apparatus of rude and shapeless Nature, which art attempts in vain, attacks at once the senses and the thoughts, and excites a gloomy and melancholy admiration."

Such are the terms in which the gallant marquis describes his first sensations, when, as yet, the view from the summit was all he had seen. He goes on to say:

"But it is at the foot of these rocks, on the edge of a little stream which flows under this immense arch, that we must judge of its astonishing structure. There we discover its immense spurs, its back-bendings, and those profiles which architecture might have given it.

caused by a volcanic upheaval, a conflagration burning in the heart of the rock-ribbed mountain, nor by the attrition of water slowly wearing away the stubborn limestone. These views are supported by men of science, as the following paragraphs will show. They are taken from the memoir of the Baron de Turpin, an engineer of ability, sent by the Comte de Rochambeau to measure the great structure:

"The mass of rock and stone which loads this arch," says the baron, "is forty-nine feet solid on the key of the great centre, and thirty-seven on that of the small one; and, as we find about the same difference in taking the level of the hill, it may be supposed that the roof is on a level the whole length of the key. It is proper to observe that the live rock continues also the whole thickness of the arch, and that on the opposite side it is only twenty-five feet wide in

its greatest breadth, and becomes gradually narrower. The whole arch seems to be formed of one and the same stone; for the joints which one remarks are the effect of lightning, which struck this part in 1779. The other head has not the smallest vein, and the intrados is so smooth that the martins, which fly around it in great numbers, cannot fasten on it. The abutments, which have a gentle slope, are entire, and, without being absolute planes, have all the polish which a current of water would give to unhewn stone in a certain time. The four rocks adjacent to the abutments seem to be perfectly homogeneous, and to have a very trifling slope. The two rocks on the right bank of the rivulet are two hundred feet high above the surface of the water, the intrados of the arch a hundred and fifty, and the two rocks on the left bank a hundred and eighty."

The baron then proceeds, as though weary of his "great centres," "intrados," and other technicalities, to burst forth with:

"If we consider this bridge simply as a picturesque object, we are struck with the majesty with which it towers in the valley. The white-oaks which grow upon it seem to rear their lofty summits to the clouds, while the same trees which border on the rivulet appear like shrubs."

This exhibition of sentiment, however, appears to exhaust the baron's stock, and he returns to his better-loved science, adding:

"We see that these rocks, being of a calcareous nature, *exclude every idea of a volcano*, which, besides, cannot be reconciled with the form of the bridge and its adjacent parts. If it be supposed that this astonishing arch is the effect of *a current of water*, we must suppose, likewise, that *this current has had the force to break down and carry to a great distance a mass of five thousand cubic fathoms, for there remains not the slightest trace of such an operation.*"

What, then, was the mystery of the origin of this celebrated structure? Science is powerless in face of the wonder, and perhaps, after all, the conclusion of De Chastellux is the only one attainable—that "it is to the labor only of the Creator that we owe the magnificent construction of the Natural Bridge"—to which he adds: "The opinion of the Comte de Buffon, whom I have since consulted, has left me no doubt upon the subject."

From this strictly scientific, but, we think, suggestive and interesting, view of the great curiosity, we pass to details and circumstances connected with it, calculated, perhaps, to interest in a larger degree the general reader.

Mr. Fenn's second drawing furnishes a distant view of the bridge, the surrounding country, and objects in its vicinity. It will recall, doubtless, to many persons, agreeable recollections of the landscape which saluted their eyes as they first drew near the place—and the names of such are legion, for the spot has been, for more than half a century, the resort of parties led by a desire to explore the beauties of the romantic scene. Of the daring of some of these visitors, in climbing, or venturing to the brink of the precipice, we shall give one or two instances, kept alive by tradition. Among these traditions, the most thrilling is that of the unshrinking nerve displayed by Miss Randolph, a young *Virginienne*, a great belle of her time, which was the early portion of the present century. The young lady had ridden, with a gay party of youthful maidens and gallant cavaliers, to the bridge, and reached it on a beautiful evening of summer. Miss Randolph is said, by those who knew and remember her, to have been a young lady of surpassing loveliness—tall, slender, with sparkling eyes, cheeks all roses, and noted for her gayety and mirthful *abandon*. Reaching the summit of the bridge, the party dismounted, cautiously approached the brink, fringed with trees growing among the rocks, and gazed into the gulf beneath. Of the terrifying character of the spectacle, President Jefferson's words will give some idea:

"Though the sides of the bridge are provided, in some parts, with a parapet of rocks," he says, "yet few men have resolution to walk to them and look over into the abyss. You involuntarily fall on your hands and feet, creep to the parapet, and look over it. Looking down from this height about a minute gave me a violent headache; the view is painful and intolerable."

Reaching this dizzy brink, the party of young ladies and gentlemen gazed below, when one of the gallants, pointing to the broken stump of a huge cedar which had once towered aloft upon a jagged abutment, separated by an intervening cleft from the main structure, expressed his conviction that no human being lived sufficiently daring to stand erect upon it. A gay laugh echoed the words, a silken scarf

brushed by him, and the whole party uttered a cry of terror—Miss Randolph, at one bound, had reached and now stood erect upon the dizzy pinnacle. Tradition relates that her companions looked at her, white and speechless, as so many corpses. Her death seemed certain. A wild spirit of bravado had given her courage for this terrible proceeding; but, perched thus on her slight footing above the frightful abyss, she must lose her nerve, grow dizzy, and be hurled upon the rocks beneath—the beautiful being of a moment since—a mass of mangled and unrecognizable flesh and bones. For an instant, the daring young lady stood erect, riding-whip in hand, her scarf floating, her eyes sparkling with triumph; then, at a single bound, she regained her former position, and, with a gay laugh, asked if any gentleman could do as much.

Tradition declares that, despite their gallantry, the youthful cavaliers exhibited their good judgment by declining; and it is probable that the worthy reader of this will approve, as the writer does, their excellent sense.

"Miss Randolph's Stump" remained in its place for many years, and the incident gave the young lady a species of celebrity throughout Virginia.

Illustrations of the bridge, from below and above, will appear in the ensuing number of the JOURNAL.

JOHN ESTEN COOKE.

THE EMPEROR OF CHINA.

AT the great exposition,
At Paris held in eighteen sixty-seven,
Miscalled the World's, because the world was there,
To spend its cash called spare,
But not to profit by the fair,
Given by Fair France to better her condition,
By bringing to her dought some foreign leaven
To make it rise, alas! to fall again,
And turn her *pain* to pain—

Two monarchs came,
The very first in European fame:
One was the Prussian William, gray and tall;
The other, Alexander,
The Russian czar, himself not very small—
The man who tried to imitate Leander,
And swim the Hellespont—without the drowning—
And yet will do't, in spite of England's frowning.

Well, these two monarchs greatly liked each other;
They called each other brother;
They wandered through the streets and avenues,
And smaller *rues*,
And boulevards, and Champ de Mars,
Without a single aide-de-camp or servant,
Of every little whim to be observant,
Alone, and quite unknown—
In short, incog.
Que sais-je what they sought? Perhaps 'twas prog,
Peculiar prog, the taste of frog,
Or steak of horse,
To know what sort of meats the French would feed on,
When William should come back with armed force—
A little plan, perhaps, they then agreed on;
Perhaps to study
The natural history of man—and woman
(A science very human),
And see grisettes, the ruddy,
In pretty little caps,
Which they don't doff, *on dit*, when taking naps.

So it fell out, one day,
The monarchs had been asked by Nap to dine,
To taste imperial wine,
Entirely *sans façon*, no sort of party,
But just to eat and drink, and have a hearty
Laugh at the world's expense—a royal time;

Surely, that's no great crime,
For kings and emperors must be very serious—
They must not laugh in public, nor appear
Otherwise than imperial and imperious,
For very fear
That other folks will think that they are men,
And pry into their titles now and then.

Well, on this day, when they were asked to dine,
And to do so "did seriously incline,"
They found themselves far distant from the spot—
The streets quite dusty, and the weather hot—
When, looking at his watch, the king cried out:
"Why, what are we about?"

We dine at seven, and now 'tis half-past six;
We're surely in a fix!

Here are we now, a mile across the Seine,
About the Latin Quarter,
While in the Tuileries the best champagne
Is in iced water."

"And then, besides, far worse betides,"
Said Alexander—"we don't know the way,
And not a carriage or a cabriolet,
Quatre places ou deux, appears in sight.
Was ever such a plight?"

"No matter," said King William; "let us try
To learn the way from some kind passer-by."
And so, accosting a good-looking man,
He said: "Monsieur, pray tell me, if you can—
And if you please—

The nearest way to reach the Tuileries."
"*Mais certainement*"—the Frenchman bowed quite double—
"I can with little trouble;

I go myself to dine at Les Trois Frères,
And pass the palace on my journey there:
So go with me." And, thanking him, they went—
Conductor Heaven-sent—

By cross-streets and short cuts the nearest way,
Until at length they came upon the *quai*.

Thus, travelling fast and far,
They crossed the river by the Pont des Arts,
And stood before the palace-portal wide;

And then their guide,
Waving his hand with graceful courtesy,
Outspoke: "*Messieurs, voici*

Les Tuileries;" and now, if I may ask,
As guiding you has been a pleasant task,
And as you seem to Paris come from far,
Pray tell me who you are."

The emperor raised his hat and bowed,
As if to say, "You do me proud,"
And said: "I am the Emperor of Russia, sir!"

The king raised his,
And, with unaltered phiz,
Replied: "And I the King of Prussia, sir!"

And here, no doubt, the matter would have ended,
But that the kind Parisian seemed offended
At what to him was a discourteous joke.
Then Alexander spoke:

"Pray tell us too your name, the name of one
Who for our sakes this courteous deed has done."

The Frenchman took his hat entirely off,
And, with a shrug that had a spice of scoff,
Shaking his head, he simply said:

"I am the Emperor of China, sirs!"

How strangely it occurs

That such great men should, now and then,
Each other meet in Paris, as we do!

Two emperors and a German king—*parbleu!*
Parbleu! Messieurs!! Adieu!!!"

And, bowing low, he left them lost in wonder,
And then to fear that they had made a blunder;

But, when at last they saw his true intent,
The king said, "*Sapperment!*"
And Alexander swore a Russian oath,
Quite strong enough for both.
Then each laughed roaringly, and held his side;
They laughed until they cried,
And thus were hardly able
To tell the story at Napoleon's table.

They had a jolly time, and many toasts—
"The Fair," "La France," and "their imperial hosts;"
But many a bumper quaffed each royal diner
To "Hip! hurrah! THE EMPEROR OF CHINA!"

HENRI DE COISSY.

THE DESCENT OF MAN.

[From Advance-sheets of Darwin's New Work.*]

HE who wishes to decide whether man is the modified descendant of some preëxisting form, would probably first inquire whether man varies, however slightly, in bodily structure and in mental faculties; and if so, whether the variations are transmitted to his offspring in accordance with the laws which prevail with the lower animals; such as that of the transmission of characters to the same age or sex. Again, are the variations the result, as far as our ignorance permits us to judge, of the same general causes, and are they governed by the same general laws, as in the case of other organisms; for instance, by correlation, the inherited effects of use and disuse, etc.? Is man subjected to similar malconformations, the result of arrested development, of reduplication of parts, etc., and does he display in any of his anomalies reversion to some former and ancient type of structure? It might also naturally be inquired whether man, like so many other animals, has given rise to varieties and sub-races, differing but slightly from each other, or to races differing so much that they must be classed as doubtful species? How are such races distributed over the world; and how, when crossed, do they react on each other, both in the first and succeeding generations? And so with many other points.

The inquirer would next come to the important point, whether man tends to increase at so rapid a rate, as to lead to occasional severe struggles for existence, and consequently to beneficial variations, whether in body or mind, being preserved, and injurious ones eliminated. Do the races or species of men, whichever term may be applied, encroach on and replace each other, so that some finally become extinct? We shall see that all these questions, as indeed is obvious in respect to most of them, must be answered in the affirmative, in the same manner as with the lower animals.

It is notorious that man is constructed on the same general type or model with other mammals. All the bones in his skeleton can be compared with corresponding bones in a monkey, bat, or seal. So it is with his muscles, nerves, blood-vessels, and internal viscera. The brain, the most important of all the organs, follows the same law, as shown by Huxley and other anatomists. Bischoff, who is a hostile witness, admits that every chief fissure and fold in the brain of man has its analogy in that of the orang; but he adds that at no period of development do their brains perfectly agree; nor could this be expected, for otherwise their mental powers would have been the same.

Man is liable to receive from the lower animals, and to communicate to them, certain diseases, as hydrophobia, variola, the glanders, etc.; and this fact proves the close similarity of their tissues and blood, both in minute structure and composition, far more plainly than does their comparison under the best microscope, or by the aid of the best chemical analysis. Monkeys are liable to many of the same non-contagious diseases as we are; thus Rengger, who carefully observed for a long time the *Cebus Azarae* in its native land, found it liable to catarrh, with the usual symptoms, and which when often recurrent led to consumption. These monkeys suffered also from apoplexy, inflammation of the bowels, and cataract in the eye. The younger ones when shedding their milk-teeth often died from fever. Medicines produced the same effect on them as on us. Many kinds of monkeys have a strong taste for tea, coffee, and spirituous liquors: they will also, as I have myself seen, smoke tobacco with pleasure. Brehm asserts that the natives of northeastern Africa catch the wild baboons by exposing vessels with strong beer, by which they are made drunk. He has seen some of these animals, which he kept in confinement, in this state; and he gives a laughable account of their behavior and strange grimaces. On the following morning they were very cross and dismal; they held their aching heads with both hands, and wore a most pitiable expression; when beer or wine was offered them, they turned away with disgust, but relished the juice of lemons.

* The Descent of Man, and Selection in Relation to Sex. By Charles Darwin. 2 vols. D. Appleton & Co.

An American monkey, an *Ateles*, after getting drunk on brandy, would never touch it again, and thus was wiser than many men. These trifling facts prove how similar the nerves of taste must be in monkeys and man, and how similarly their whole nervous system is affected.

Man is infested with internal parasites, sometimes causing fatal effects, and is plagued by external parasites, all of which belong to the same genera or families with those infesting other mammals. Man is subject like other mammals, birds, and even insects, to that mysterious law, which causes certain normal processes, such as gestation, as well as the maturation and duration of various diseases, to follow lunar periods. His wounds are repaired by the same process of healing; and the stumps left after the amputation of his limbs occasionally possess, especially during an early embryonic period, some power of regeneration, as in the lowest animals.

The whole process of that most important function, the reproduction of the species, is strikingly the same in all mammals, from the first act of courtship by the male to the birth and nurturing of the young. Monkeys are born in almost as helpless a condition as our own infants; and in certain genera the young differ fully as much in appearance from the adults, as do our children from their full-grown parents. It has been urged by some writers as an important distinction, that with man the young arrive at maturity at a much later age than with any other animal: but if we look to the races of mankind which inhabit tropical countries the difference is not great, for the orang is believed not to be adult till the age of from ten to fifteen years. Man differs from woman in size, bodily strength, hairiness, etc., as well as in mind, in the same manner as do the two sexes of many mammals. It is, in short, scarcely possible to exaggerate the close correspondence in general structure, in the minute structure of the tissues, in chemical composition, and in constitution, between man and the higher animals, especially the anthropomorphic apes.

Man is developed from an ovule, about the one hundredth and twenty-fifth of an inch in diameter, which differs in no respect from the ovules of other animals. The embryo itself at a very early period can hardly be distinguished from that of other members of the vertebrate kingdom. At this period the arteries run in arch-like branches, as if to carry the blood to branchiæ which are not present in the higher vertebrata, though the slits on the sides of the neck still remain, marking their former position. At a somewhat later period, when the extremities are developed, "the feet of lizards and mammals," as the illustrious Von Baer remarks, "the wings and feet of birds, no less than the hands and feet of man, all arise from the same fundamental form." "It is," says Professor Huxley, "quite in the latter stages of development that the young human being presents marked differences from the young ape, while the latter departs as much from the dog in its developments, as the man does. Startling as this last assertion may appear to be, it is demonstrably true."

After the foregoing statements made by such high authorities, it would be superfluous on my part to give a number of borrowed details, showing that the embryo of man closely resembles that of other mammals. I will conclude with a quotation from Huxley, who, after asking, Does man originate in a different way from a dog, bird, frog, or fish? says: "The reply is not doubtful for a moment; without question, the mode of origin and the early stages of the development of man are identical with those of the animals immediately below him in the scale: without a doubt in these respects, he is far nearer to apes, than the apes are to the dog."

The bearing of the three great classes of facts now given is unmistakable. But it would be superfluous here fully to recapitulate the line of argument given in detail in my "Origin of Species." The homological construction of the whole frame in the members of the same class is intelligible, if we admit their descent from a common progenitor, together with their subsequent adaptation to diversified conditions. On any other view the similarity of pattern between the hand of a man or monkey, the foot of a horse, the flipper of a seal, the wing of a bat, etc., is utterly inexplicable. It is no scientific explanation to assert that they have all been formed on the same ideal plan. With respect to development, we can clearly understand, on the principle of variations supervening at a rather late embryonic period, and being inherited at a corresponding period, how it is that the embryos of wonderfully different forms should still retain, more or less perfectly, the structure of their common progenitor. No other explanation has ever been given of the marvellous fact that the embryo of a man, dog, seal, bat, reptile, etc., can at first hardly be distinguished from each other. In order to understand the existence of rudimentary organs, we have only to suppose that a former progenitor possessed the parts in question in a perfect state, and that under changed habits of life they became greatly reduced, either from simple disuse, or through the natural selection of those individuals which were least encumbered with a superfluous part, aided by the other means previously indicated.

Thus we can understand how it has come to pass that man, and all other vertebrate animals, have been constructed on the same general model, why they pass through the same early stages of development, and why they retain certain rudiments in common. Consequently we ought frankly to admit their community of descent; to take any other

view, is to admit that our own structure, and that of all the animals around us, is a mere snare laid to entrap our judgment. This conclusion is greatly strengthened, if we look to the members of the whole animal series, and consider the evidence derived from their affinities or classification, their geographical distribution, and geological succession. It is only our natural prejudice, and that arrogance which made our forefathers declare that they were descended from demigods, which lead us to demur to this conclusion. But the time will before long come when it will be thought wonderful that naturalists, who were well acquainted with the comparative structure and development of man and other mammals, should have believed that each was the work of a separate act of creation.

As soon as some ancient member in the great series of the Primates came, owing to a change in its manner of procuring subsistence, or to a change in the conditions of its native country, to live somewhat less on trees and more on the ground, its manner of progression would have been modified; and in this case it would have had to become either more strictly quadrupedal or bipedal. Baboons frequent hilly and rocky districts, and only from necessity climb up high trees; and they have acquired almost the gait of a dog. Man alone has become a biped; and we can, I think, partly see how he has come to assume his erect attitude, which forms one of the most conspicuous differences between him and his nearest allies. Man could not have attained his present dominant position in the world without the use of his hands, which are so admirably adapted to act in obedience to his will. As Sir C. Bell insists, "the hand supplies all instruments, and by its correspondence with the intellect gives him universal dominion." But the hands and arms could hardly have become perfect enough to have manufactured weapons, or to have hurled stones and spears with a true aim, as long as they were habitually used for locomotion and for supporting the whole weight of the body, or as long as they were especially well adapted, as previously remarked, for climbing trees. Such rough treatment would also have blunted the sense of touch, on which their delicate use largely depends. From these causes alone it would have been an advantage to man to have become a biped; but, for many actions, it is almost necessary that both arms and the whole upper part of the body should be free; and he must for this end stand firmly on his feet. To gain this great advantage, the feet have been rendered flat, and the great-toe peculiarly modified, though this has entailed the loss of the power of prehension. It accords with the principle of the division of physiological labor, which prevails throughout the animal kingdom, that, as the hands became perfected for prehension, the feet should have become perfected for support and locomotion. With some savages, however, the foot has not altogether lost its prehensile power, as shown by their manner of climbing trees and of using them in other ways.

According to a popular impression, the absence of a tail is eminently distinctive of man; but, as those apes which come nearest to man are destitute of this organ, its disappearance does not especially concern us. Nevertheless it may be well to own that no explanation, as far as I am aware, has ever been given of the loss of the tail by certain apes and man. Its loss, however, is not surprising, for it sometimes differs remarkably in length in species of the same genera: thus in some species of *Macacus* the tail is longer than the whole body, consisting of twenty-four vertebrae; in others it consists of a scarcely-visible stump, containing only three or four vertebrae. In some kinds of baboons there are twenty-five, while in the mandrill there are ten very small stunted caudal vertebrae, or, according to Cuvier, sometimes only five. This great diversity in the structure and length of the tail in animals belonging to the same genera, and following nearly the same habits of life, renders it probable that the tail is not of much importance to them; and if so, we might have expected that it would sometimes have become more or less rudimentary, in accordance with what we incessantly see with other structures. The tail almost always tapers toward the end, whether it be long or short; and this, I presume, results from the atrophy, through disuse, of the terminal muscles, together with their arteries and nerves, leading to the atrophy of the terminal bones. With respect to the os coccyx, which in man and the higher apes manifestly consists of the few basal and tapering segments of an ordinary tail, I have heard it asked how could these have become completely embedded within the body; but there is no difficulty in this respect, for in many monkeys the basal segments of the true tail are thus embedded. For instance, Mr. Murie informs me that in the skeleton of a not full-grown *Macacus inornatus*, he counted nine or ten caudal vertebrae, which altogether were only 1.8 inch in length. Of these three basal ones appeared to have been embedded; the remainder forming the free part of the tail, which was only one inch in length, and half an inch in diameter. Here, then, the three embedded caudal vertebrae plainly correspond with the four coalesced vertebrae of the human os coccyx.

As man at the present day is liable, like every other animal, to multimorph individual differences or slight variations, so no doubt were the early progenitors of man; the variations being then as now induced by the same general causes, and governed by the same general and complex laws. As all animals tend to multiply beyond their

means of subsistence, so it must have been with the progenitors of man; and this will inevitably have led to a struggle for existence and to natural selection. This latter process will have been greatly aided by the inherited effects of the increased use of parts; these two processes incessantly reacting on each other. It appears, also, as we shall hereafter see, that various unimportant characters have been acquired by man through sexual selection. An unexpected residuum of change, perhaps a large one, must be left to the assumed uniform action of those unknown agencies, which occasionally induce strongly-marked and abrupt deviations of structure in our domestic productions.

Judging from the habits of savages and of the greater number of the *Quadrumana*, primeval men, and even the ape-like progenitors of man, probably lived in society. With strictly social animals, natural selection sometimes acts indirectly on the individual, through the preservation of variations which are beneficial only to the community. A community, including a large number of well-endowed individuals, increases in number, and is victorious over other and less well-endowed communities; although each separate member may gain no advantage over the other members of the same community. With associated insects many remarkable structures, which are of little or no service to the individual or its own offspring, such as the pollen-collecting apparatus, or the sting of the worker-bee, or the great jaws of soldier-ants, have been thus acquired. With the higher social animals, I am not aware that any structure has been modified solely for the good of the community, though some are of secondary service to it. For instance, the horns of ruminants, and the great canine teeth of baboons appear to have been acquired by the males as weapons for sexual strife, but they are used in defence of the herd or troop. In regard to certain mental faculties the case, as we shall see in the following chapter, is wholly different; for these faculties have been chiefly, or even exclusively, gained for the benefit of the community; the individuals composing the community being at the same time indirectly benefited.

In regard to bodily size or strength, we do not know whether man is descended from some comparatively small species, like the chimpanzee, or from one as powerful as the gorilla; and, therefore, we cannot say whether man has become larger and stronger, or smaller and weaker, in comparison with his progenitors. We should, however, bear in mind that an animal possessing great size, strength, and ferocity, and which, like the gorilla, could defend itself from all enemies, would probably, though not necessarily, have failed to become social; and this would most effectually have checked the acquirement by man of his higher mental qualities, such as sympathy and the love of his fellow-creatures. Hence it might have been an immense advantage to man to have sprung from some comparatively weak creature.

The slight corporeal strength of man, his little speed, his want of natural weapons, etc., are more than counterbalanced, firstly by his intellectual powers, through which he has, while still remaining in a barbarous state, formed for himself weapons, tools, etc., and secondly by his social qualities, which lead him to give aid to his fellow-men, and to receive it in return. No country in the world abounds in a greater degree with dangerous beasts than Southern Africa; no country presents more fearful physical hardships than the arctic regions; yet one of the puniest races, namely, the Bushmen, maintain themselves in Southern Africa, as do the dwarfed Esquimaux in the arctic regions. The early progenitors of man were, no doubt, inferior in intellect, and probably in social disposition, to the lowest existing savages; but it is quite conceivable that they might have existed, or even flourished, if, while they gradually lost their brute-like powers, such as climbing trees, etc., they at the same time advanced in intellect. But granting that the progenitors of man were far more helpless and defenceless than any existing savages, if they had inhabited some warm continent, or large island, such as Australia or New Guinea, or Borneo (the latter island being now tenanted by the orang), they would not have been exposed to any special danger. In an area as large as one of these islands, the competition between tribe and tribe would have been sufficient, under favorable conditions, to have raised man, through the survival of the fittest, combined with the inherited effects of habit, to his present high position in the organic scale.

We are naturally led to inquire where was the birthplace of man at that stage of descent, when our progenitors diverged from the *Catharine* stock [of apes]. The fact that they belonged to this stock clearly shows that they inhabited the Old World; but not Australia nor any oceanic island, as we may infer from the laws of geographical distribution. In each great region of the world, the living mammals are closely related to the extinct species of the same region. It is therefore probable that Africa was formerly inhabited by extinct apes closely allied to the gorilla and chimpanzee; and as these two species are now man's nearest allies, it is somewhat more probable that our early progenitors lived on the African Continent, than elsewhere. But it is useless to speculate on this subject, for an ape nearly as large as a man, namely, the *Dryopithecus* of Lartet, which was closely allied to the anthropomorphous *Hylobates*, existed in Europe during the Upper Miocene period; and since so remote a period the earth has

certainly undergone many great revolutions, and there has been ample time for migration on the largest scale.

At the period and place, whenever and wherever it may have been, when man first lost his hairy covering, he probably inhabited a hot country; and this would have been favorable for a frugiferous diet, on which, judging from analogy, he subsisted. We are far from knowing how long ago it was when man first diverged from the *Catharine* stock; but this may have occurred at an epoch as remote as the Eocene period; for the higher apes had diverged from the lower apes as early as the Upper Miocene period, as shown by the existence of the *Dryopithecus*. We are also quite ignorant at how rapid a rate organisms, whether high or low in the scale, may under favorable circumstances be modified: we know, however, that some have retained the same form during an enormous lapse of time. From what we see going on under domestication, we learn that within the same period some of the co-descendants of the same species may be not at all changed, some a little, and some greatly changed. Thus it may have been with man, who has undergone a great amount of modification in certain characters in comparison with the higher apes.

We have thus far endeavored rudely to trace the genealogy of the Vertebrata by the aid of their mutual affinities. We will now look to man as he exists; and we shall, I think, be able partially to restore during successive periods, but not in due order of time, the structure of our early progenitors. This can be effected by means of the rudiments which man still retains, by the characters which occasionally make their appearance in him through reversion, and by the aid of the principles of morphology and embryology. The various facts, to which I shall here allude, have been given in the previous chapters. The early progenitors of man were no doubt once covered with hair, both sexes having beards; their ears were pointed and capable of movement; and their bodies were provided with a tail, having the proper muscles. Their limbs and bodies were also acted on by many muscles which now only occasionally reappear, but are normally present in the *Quadrumana*. The great artery and nerve of the humerus ran through a supra-condyloid foramen. At this or some earlier period, the intestine gave forth a much larger diverticulum or caecum than that now existing. The foot, judging from the condition of the great-toe in the foetus, was then prehensile; and our progenitors, no doubt, were arboreal in their habits, frequenting some warm, forest-clad land. The males were provided with great canine teeth, which served them as formidable weapons.

At a much earlier period the uterus was double; the excreta were voided through a cloaca; and the eye was protected by a third eyelid or nictitating membrane. At a still earlier period the progenitors of man must have been aquatic in their habits; for morphology plainly tells us that our lungs consist of a modified swim-bladder, which once served as a float. The clefts on the neck in the embryo of man show where the branchiae once existed. At about this period the true kidneys were replaced by the corpora Wolffiana. The heart existed as a simple pulsating vessel; and the chorda dorsalis took the place of a vertebral column. These early predecessors of man, thus seen in the dim recesses of time, must have been as lowly organized as the lancelet or amphioxus, or even still more lowly organized.

The most ancient progenitors in the kingdom of the Vertebrata, at which we are able to obtain an obscure glance, apparently consisted of a group of marine animals, resembling the larvæ of existing Ascidians. These animals probably gave rise to a group of fishes, as lowly organized as the lancelet; and from these the Ganoids, and other fishes like the *Lepidosiren*, must have been developed. From such fish a very small advance would carry us on to the amphibians. We have seen that birds and reptiles were once intimately connected together; and the *Monotremata* now, in a slight degree, connect mammals with reptiles. But no one can at present say by what line of descent the three higher and related classes, namely, mammals, birds, and reptiles, were derived from either of the two lower vertebrate classes, namely, amphibians and fishes. In the class of mammals the steps are not difficult to conceive which led from the ancient *Monotremata* to the ancient *Marsupials*; and from these to the early progenitors of the placental mammals. We may thus ascend to the *Lemuridae*; and the interval is not wide from these to the *Simiadae*. The *Simiadae* then branched off into two great stems, the New World and Old World monkeys; and from the latter, at a remote period, Man, the wonder and glory of the Universe, proceeded.

Thus we have given to man a pedigree of prodigious length, but not, it may be said, of noble quality. The world, it has often been remarked, appears as if it had long been preparing for the advent of man; and this, in one sense, is strictly true, for he owes his birth to a long line of progenitors. If any single link in this chain had never existed, man would not have been exactly what he now is. Unless we wilfully close our eyes, we may, with our present knowledge, approximately recognize our parentage; nor need we feel ashamed of it. The most humble organism is something much higher than the inorganic dust under our feet; and no one with an unbiased mind can study any living creature, however humble, without being struck with enthusiasm at its marvellous structure and properties.

TABLE-TALK.

THE current American notions of France

have been generally formed from superficial acquaintance with Paris, and a few famous authors like Voltaire, Rousseau, and the modern novelists. But France and French character are suggestive of much more than Paris, and Voltaire, and the novel-writers. What most of us know about France is limited to the external aspects of Paris-life and to the Parisian writers. But these, though naturally having the ascendancy of all light and sparkling bodies, represent only the most superficial traits of French character. The varied elements of race and of temperaments, the opposed and diverse moral and intellectual materials of France, are sufficient to show the fallacy of generalizations which represent the Frenchman as a giddy, extravagant, irreligious, immoral being. Outside of the whirl of Paris, France has engendered men of as cold and hard a temperament as Scotland's Knox, or New-England's Edwards; soldiers as obstinate as Grant; statesmen as pure as Washington and lofty as Burke; she has produced Calvin, the root of a vast and sturdy religious democracy; Descartes, the great reformer and liberator of European intellect, who is said to have done for the intellectual world what Luther commenced in the ecclesiastical world; Pascal, than whom no English moralist is more grave, and precise, and searching; and L'Hôpital, the wise and disinterested statesman. The Frenchmen most widely celebrated, like Voltaire and De Musset, for vivacity and shallowness, and yet for penetrating and stimulative wit, are, after all, like the light and sparkling wine of Champagne, significant of but a part of France. We must not overlook the crafty and quarrelsome Norman; we must make room for what Burgundy has given to France, the richest wine and the grandest eloquence, both of which suffer by transportation; fervid and splendid types, like Bossuet and Mirabeau. The truth is, the great renown of France is the result of the variety and keenness, the gravity and depth, the vast and multiform genius, she has engendered on her soil and nourished by her civilization. Her genius has been light, and keen, and irreverent, in the head, at Paris, but strong, opulent, heroic, at the extremities. Her greatest soldiers, thinkers, and orators, have come from the provinces, and from them again must come her salvation, now that her Parisian head is powerless to deliver her from her enemies. Duguesclin, Montmorency, Turenne, Marshal Saxe, Bonaparte—these great soldiers came from the provinces of France, and likewise the thinkers and statesmen, L'Hôpital, Descartes, Pascal, Richelieu, Montesquieu, and Mirabeau. The sad and patient Trochu comes from Brittany, which is said to afford the most unyielding element of the French nation, certainly the most devoted and religious, in the Protestant sense of the term, which is fidelity to an exalted sense of duty. The truth is, French character is about as multiform and many-sided as we can possibly conceive; and yet such is the force of prejudice, that among the English-speaking nations French

character is but another term for frivolity and irreligion. This, in spite of the fact that the historic life of France has afforded the great representative types of character, from Rabelais and Montaigne to Voltaire and Rônan; the type of Christian sweetness in Fénelon, the type of controversial and haughty power in Bossuet, of Protestant plainness and logic in Pascal, of genial humanity in Molière, of poetic sensibility in Lamartine, of poetic genius in Victor Hugo and George Sand, of intellectual discrimination in Saint-Beuve, of piety and grace in Eugénie de Guérin. If we would appreciate the French, we must understand the measure of the influence of these men and women, and we must be able to give an account of them, before we can presume to talk about French character, which is not one but many sided in its historical manifestations.

— "It is no doubt good," says the *Pall Mall Gazette*, commenting on the fact that Christian kindness should not too exclusively limit its manifestations to Christmas, "to give coals and blankets to some of the poor once a year, and by so doing a certain amount of individual suffering is to a slight extent mitigated, but the root of pauperism remains untouched—nor shall we ever reach it by one day's digging. To lift the poorer classes in this country from the wretchedness of their existence, and to bring cleanliness, order, and comfort into their dwellings, requires a long-sustained and united effort on the part of their less afflicted brethren. It is not by putting a little food in their troughs, and leaving them in their pigstyes, that we shall benefit the poor. They require lifting from the state of degradation into which we have suffered them to fall; our dealings with them should be dictated by common-sense rather than by what we call charity. We should endeavor to place the blessings of civilization within their reach, instead of expecting them to live like Christians while they herd like pigs; but we shall never do this so long as we sit wrapped in the robes of respectability, serenely smiling at the thought of our own goodness, and forgetting that our hearts should be as evergreen as the Christmas holly that adorns our houses." Without disputing the excellence of this sentiment, we may ask whether the *Pall Mall Gazette* imagines that, by any form of alms-giving, the poorer classes can be lifted from the wretchedness of their existence? So far, experience shows us that poverty increases with the poor-rates, and that dispensations of charity seem, as a whole, to rather multiply need than to remove it. Certain stern economists are of opinion that the sole means of preventing impoverishment is in rigidly enforcing prudence and forethought, by compelling people who neglect the practice of those virtues to suffer the full consequences of their indolence, their heedlessness, or their vicious indulgences. This seems very harsh. But every one knows how the inexorable laws of Nature enforce caution and care. That fire will burn and water drown, are facts accepted without any reserve, and no one expects charity or tenderness from Nature when he disregards her obvious laws. Perhaps a similar inexorable consequence of a neglect of the laws of society would in the end be favorable.

But charity and good feeling are likely always to interpose and save men from at least a measure of those sufferings which otherwise would inevitably follow as the harvest of the seed they have sown. But the poverty, the misery, the suffering of the world, demand our care and consideration, even if the economists be right. Charity, indeed, can only "skin and film the ulcerous place;" something else is needed to reach to the root of social distress, and whoever can discover this will give the world the grandest Christmas-gift devised since the institution of the day. "In England," says Victor Hugo, "there is excellent accumulation of wealth, but very bad distribution." With a better distribution of the products of labor, would come those ambitions that lead to education and social elevation. Education, indeed, may be a necessary preliminary to this better distribution, and, as the problem of how to secure this more just equalization of wealth is one not likely soon to be solved, it may well be considered whether general, and perhaps compulsory, education, is not the thing nearest to the hand to do. A compulsory education is intensely repugnant to the prejudices of most of us, but, if we do not mistake the signs of the times, it is on the cards for the future. Even in England, where the intervention of government in personal matters is more resisted than almost anywhere else, the need of compulsory education is now widely discussed, and appears to be rapidly gaining adherents. The welfare, security, almost the existence of society, it is claimed, depend upon the elevation of the lower classes, and to this end there seems nothing so important as a general education.

— The history of literature is marked by its distinct eras, but contemporaries probably often fail to perceive the ending or the beginning of these periods. The undulations of a highway are scarcely noted as we travel over them; but at a distance, or in perspective, the distinct features of the ground become more obvious. It will be much more apparent ages hence than it is now that the close of the present decade is the definite completion of a literary era. And yet we have only to carefully survey the ground, even from our present point of view, to see how clearly the death of Charles Dickens has completed, in literature, the history of a certain humorous epoch, illuminated by the genius of such men as Douglas Jerrold, Thackeray, Albert Smith, Mark Lemon, and John Leech. We have included in this list a famous draughtsman, because mention of the great humorous lights of the period just closed would be incomplete without the name of Leech, who has been happily described as the Dickens of the pencil. The text to his pictures, moreover, was often as happy as the designs themselves, and gave him place among the writers. The group we have named—and there are other humorists, both of the pen and pencil, that might be included—forms a class of which there are no survivors and no successors. Reade, Wilkie Collins, Kingsley, George Eliot, and Trollope, form a distinct group. Of humorous or satirical writers in England, there are now very few, indeed, and no one of note. While we discover none upon

whom the mantle of Thackeray or Dickens can fall, we see no indications of a new method. The new school of humorous literature seems to be purely American; and the country so prodigal in wit and humor—which boasts of the comedies of Shakespeare and Sheridan; of the novels of Fielding, Smollett, Thackeray, and Dickens; of the writings of Swift and Sterne; of the essays of Lamb and Sydney Smith—is now heartily accepting the new and fantastic humors of Artemus Ward and Mark Twain, and extending even a cordial hospitality to our latest star, Bret Harte. What new form humor will take in English literature, no one, perhaps, can say; but, until this era arrives, we are only grateful of an opportunity to furnish our cousin Bull with first-rate specimens of a bran-new article, which we trust he will appreciate as heartily as we have his long excellent and unrivalled productions in the same line.

— The literary sensation of the month is evidently the publication of the first volume of Darwin's long-expected work on "The Descent of Man," from which we give copious extracts in this number of the JOURNAL. The specimens we have selected are sufficient to indicate the startling conclusions at which Mr. Darwin has arrived, though, of course, they are not extensive enough to show the elaborate process of reasoning by which he reaches these conclusions. It will be seen that he assumes without hesitation or qualification that man has descended, or rather we should say ascended, by gradual development, regulated by the principle of natural selection, from the lowest point of animal life. In other words, man was not specially created, but has been developed from some species of ape or monkey, which species was itself developed from some other kind of animal, thus going backward to the clam and the oyster, and even beyond, until we find the germs of every thing in the nebulous matter, or whatever it was, that first existed in the universe. All this process of development has been carried on, not by the Deity, but by Nature, exercising an occult power of selection, by which the best and strongest members of every species are preserved, and variations made which grow by successive advances into new species. This doctrine, of course, will be regarded by many as atheistic, though it does not necessarily exclude the idea of God as the Creator or First Source at the beginning. It conflicts, however, most positively with the Scriptural declaration that God specially created man and the lower animals, not by a slow process of development, but by a direct exercise of power. Aside from theological objection to it, we think every intelligent reader of the book will perceive that, with all the author's ability and ingenuity, his argument is little better than a string of assumptions, and that the facts on which he relies to prove his theory of development may all be explained by half a dozen other theories. He has not been able to find in the whole range of Nature one single proof to confirm his assumptions. Not the slightest trace has been discovered of a monkey changing into a man, of a bear becoming a whale, or of a fish growing into a land animal. Even the principle of natural selection

on which his whole scheme depends seems to us, as he has extended it, to be mainly arbitrary and imaginary, and to have little real scientific basis.

— Our comments in another paragraph, in regard to alms-giving, embody sentiments quite likely to excite the indignation of many worthy people. When a fire is raging in the house, they will argue, the inmates must be rescued without regard to how far culpable they have been in causing the conflagration. Very true. And yet this illustration brings to mind very good evidence as to the advantages of holding people rigidly to the consequences of their own indiscretions. In Paris, fire insurance never covers a loss upon the premises where the fire originated. Insurance only secures one against the carelessness of his neighbors, but gives him no immunity for his own. This would seem, at first glance, to entail a great deal of suffering upon innocent and unfortunate people, but the exact result is that there are no fires in Paris—or almost none. This is a great contrast with American cities, where everybody is insured against loss in case of fire, and where fires are so abundant that rates of insurance have steadily increased, and companies incautiously managed are almost certain to succumb to an accumulation of losses.

— The *New York Evening Post*, whose standard of taste is very high, and whose critical judgment is rarely at fault, compliments highly a recent number of the JOURNAL, which it says "is now printed on delicate tinted paper, and makes a beautiful appearance." Our tinted paper, in fact, we regard as an improvement which will in time strongly commend itself to readers of taste and discernment. It adds greatly to the beauty of our illustrations, the full effect of which can hardly be obtained on white paper, as all connoisseurs in art are aware.

— In the JOURNAL of January 28th, an error of the press occurred in the article "A Visit to Mauch Chunk," by which persons designing to visit that quaint little town would be grievously misled. Mauch Chunk is not reached in "five hours from New York by the *New-York Central*," as so positively stated, but by the *New-Jersey Central*—an error easily made, but a distinction with a very great difference indeed.

Literary Notes.

J. R. OSGOOD & CO. have published, in one volume, a complete edition of the poems of the late George Arnold, including I., "Drift, and other Poems," and II., "Poems Grave and Gay." The poems are prefaced with a gracefully-written memoir of the author by Mr. William Winter. Mr. Winter's estimate of Arnold, as a poet, will generally be accepted by the friends and admirers of one who died too young. "I believe," says Mr. Winter, "that Arnold will be recognized as truly a poet—as one, that is, who knew and worshipped and could interpret the beautiful; who understood, by poetic intuition, the heart of man and the sanctity of Nature; who felt, therefore, the deep, latent tragedy of human life, and heard the voice of God in rustling leaf and babbling brook and murmuring surges

of ocean; who widely sympathized with the aspirations of humanity, desiring that happiness might prevail as the fruit of justice; who uttered, in admirable forms of art, the truth which he saw and felt, and the ideal for which he longed; and who preserved, through care and sin and sorrow, a simple nature, a true heart, and perfect faith in goodness and beauty."

"Life and Nature under the Tropics; or, Sketches of Travels among the Andes, and on the Orinoco, Rio Negro, and Amazons," is a narrative by Messrs. H. M. and P. V. N. Myers, of a scientific expedition from Williams College to the tropical regions of South America, in the summer of 1867. The expedition was formed in two divisions: one proceeding from Caracas, upon the northern coast, penetrated to the Amazon by the course of the Orinoco and Rio Negro; the other, crossing the continent from the west, ascending the Andes to Quito, thence descending the slope of the Eastern Cordillera to the Rio Napo, and down this river, by canoe, to the Amazon. The scientific results of the western branch have already been given to the public by Professor Orton, and this work, while briefly referring to that division, gives mainly the results of the authors' own observations. The greater portion of the work is devoted to the Orinoco, Rio Negro, and the Andes, with two chapters only to the Amazon. The narrative is animated, vivid, and highly interesting, and by no means needs the apology given by the authors, of being "in our boyish way." "A boyish way" is often a very fresh, bright, and pleasant way.

D. Appleton & Co. have just published "General Surgical Pathology and Therapeutics, in Fifty Lectures, a Text-book for Students and Physicians, by Dr. Theodor Billroth, Professor of Surgery in Vienna, translated from the fourth German edition, with the special permission of the author, by Charles E. Hackley, A. M., M. D., Surgeon to the New-York Eye and Ear Infirmary," etc. Professor Billroth, one of the most noted authorities on surgical pathology, has, in the present volume, given us a complete *résumé* of the existing state of knowledge in this branch of medical science—a knowledge which, during the past ten years, the microscope has greatly advanced, and which, perhaps, has made more progress in Germany than elsewhere. Professor Billroth's work has reached four editions in Germany, and has been translated into French, Italian, Russian, Hungarian, and now into English—facts which should be some guarantee of its standing.

G. P. Putnam & Son have published, in one volume, an abridgment of Washington Irving's "Life of Washington." The five volumes, comprising the original work, are here compacted in one volume, by means of a condensation that omits no facts or incidents in the career of Washington, and yet retains the language of the author. This abridgment is designed for students, schools, or those who may desire in the family a compact volume which shall include both a history of the Revolution and a life of its most conspicuous leader. The abridgment is flowing, easy, connected, and gives no evidence of excision.

The Rev. W. W. Skent is engaged on a new edition of "Chatterton," for Messrs. Bell & Daldy's "Aldine Series," in which he is tracing to their sources Chatterton's ludicrous mistakes in the use of early English words; and at the same time showing what very good poetry Chatterton's lines make when turned into the modern English they were first

written in. The ignorance of old English among Chatterton's contemporaries must have been very far greater than that which now prevails. Mr. Edward Bell is to write the "Life of Chatterton" that will accompany Mr. Skeat's edition of the poet's works.

Signor Gaspare Barbèra, the most enterprising of Italian publishers, has just issued a republication of Dante's "Divina Commedia," with the valuable comments of Signor Andreoli, in one volume, which is sold for the very low price of thirty-eight cents. Still cheaper is the volume which contains the "Rime" of Petrarch, with Ambrosoli's notes and Leopardi's interpretations, of which the price is only nineteen cents. Thus, Dante and Petrarch are brought within the means of every student of Italian literature.

The "Dictionary of the Judges of England" comprises notices of upward of sixteen hundred judges. It is remarkable that among them there are only three Browns and three Smiths, and that there is no Robinson. As a body, their respectability, or their fortune, may be inferred from the fact that only one of them has been, in the space of eight hundred years, sentenced to be hanged, and that even on him the extreme penalty of the law was not carried into effect.

The "Alta California" of December 29th sets at rest a current story by the following: "It is stated that Frank Bret Harte has received offers from publishers of Eastern magazines, to write twelve articles for five thousand dollars. This has been declined, and Mr. Harte will continue in the editorial chair of the *Overland Monthly*. And San Francisco is right in thinking that it could not afford to spare him. And he is right in staying on the soil from which his genius has drawn such fruits."

"A Defence of the German Classical Writers" against recent attacks, especially Goethe and Lessing, by A. Bode, takes up the cudgels in their behalf, on the score of profligacy and self-admiration as respects Goethe, and of a fanatical hatred of Christianity as concerns Lessing, but in fact contributes little new information concerning those much-criticised celebrities.

Six new ballads, by Charles G. Leland, with the title of "Hans Breitmann as a Uhlan," have recently been published in London, and will soon be issued in Philadelphia by T. B. Peterson & Brothers. The brief tract by the same author, "France, Alsace, and Lorraine," published soon after the breaking out of the war, has been very favorably received abroad.

The concluding volume of Schelling's "Correspondence," of which his recent biography mainly consists, has been published in Leipsic. With the exception of several letters to Victor Cousin, it is chiefly addressed to relatives and disciples, and mixes up profound philosophical discussions with the familiar topics of the day in a somewhat odd compound.

G. P. Putnam & Son will shortly issue "Ghardaia; or, Ninety Days in the Desert of Sahara." It describes a journey from Algiers across the Atlas Mountains to Ghardaia, the great oasis of the Desert of Sahara. This work is by Dr. Naphegyi, a Hungarian gentleman residing in New York.

D. Appleton & Co. have published, in one volume, the third and fourth parts of Herbert Spencer's "Principles of Psychology"—Part III., General Synthesis, and Part IV., Special Synthesis. The previous parts of this great

work were, "The Data of Psychology," and "The Induction of Psychology."

Mr. Halliwell has discovered that Shakespeare's company of actors visited Bristol in the summer of the year 1597. Mr. Halliwell made this discovery in the course of an examination of the municipal archives of the city, in search of materials for his forthcoming work on the early English stage.

Mr. Hotten is preparing to bring out, in a collected form, the amusing "Comic Almanack," which Mr. George Cruikshank illustrated during some nineteen years, and to which Hood, Albert Smith, A'Beckett, the Mayhews, and others, contributed. The series extends from 1835 to 1853.

Among German works announced are Rudolf von Raumer's "History of Germanic Philology, especially in Germany;" Karl Müllenhoff's "German Antiquities," vol. i.; E. L. Rochholz's "Three Local Goddesses, Walburg, Verena, and Gertrude, as German Saints."

It is announced that the Princess Louise, with the express consent of her majesty, has accepted the dedication of Mr. Robert Buchanan's work on the Highlands, and that the book will appear immediately, under the title of "Hebrides and the Land of Lorn."

Mr. Frederick Myers, author of "St. Paul, and other Poems," is engaged on a "History of French Literature," similar in scope and aim to M. Taine's book on "English Literature."

The memoir of H. W. Longfellow by Rossetti, in the illustrated English edition of his works, is said to be "wisely critical, and worthy of the pen of one accustomed to deal with poets of the calibre of Wordsworth and Shelley."

The poet, Robert Buchanan, has in the press a lyrical drama, entitled "Napoleon Fallen," the scene of which is laid in the castle of Wilhelmshöhe, after the surrender of Sedan.

A new edition of Freiligrath's poems is announced in Stuttgart, to which romantic town the patriotic lyrist of Germany has retired from his protracted residence in foreign lands.

"The Autobiography of Lord Brougham" is announced as nearly ready for publication by Blackwood.

"A Life of Washington Irving," in German, by Adolph Laun, a popular writer, has been published in Berlin.

War Notes.

A Dinner with Bismarck.

A MEMBER of the Spanish embassy in Paris, M. Angel de Miranda, who left the city during the siege, and afterward dined at Count Bismarck's house at Versailles, has just published a pamphlet in which he makes some very curious revelations of the conversation he had with the count while they sat together, after dinner, over their wine. M. de Miranda's story, however, must not be taken too literally. "The house," he says, "is in one of the darkest streets of dark Versailles; it is humble in appearance, and almost bare. The heat in the anteroom was stifling; huge military cloaks and enormous boots littered the floor; and in a corner there were a dozen clerks sorting papers." On entering with his escort,

a Prussian lieutenant of hussars, he was received by Herr Hatzfeld, the head of the Chancellor's Cabinet, at whose appearance the lieutenant assumed that attitude of stiff submission which Heine once said "makes Prussian officers look as if they had swallowed the stick with which they had been beaten." The room in which Count Bismarck received M. de Miranda was full of smoke, and even hotter than the anteroom. Two candles stuck into bottles were burning on the mantel-piece; in the middle was a rickety table, on which were placed a jug of beer and four silver tankards. The count, after closely cross-examining his visitor as to the state in which he left Paris and the manner in which he crossed the Prussian lines, asked him to remain to dinner, adding that he had already dined himself, and begged M. de Miranda to excuse his being present, as he had some pressing work to do. After dinner the chancellor came in, and, seating himself astride on a chair opposite his guest, called for some Burgundy. Eight bottles were brought in. Count Bismarck tasted the first; it was Nuits, and he did not like it. A second bottle was opened, and the count, after tasting it, exclaimed: "Excellent! That's Romanée." M. de Miranda then complimented the chancellor on his cellar; but the latter assured him that the wine came from the Hôtel des Réservoirs, as he paid religiously for all he consumed, and refused on principle to take any thing on requisition. The conversation next turned on the state of Paris. M. de Miranda having observed that the Parisians were determined to resist to the last, the count said he did not believe they would hold out long, as it was merely the self-love of the Parisians which prevents them from surrendering. "In any case," he added, "we will wait, if necessary, but we will enter Paris. The king has quite made up his mind, although he wants to spare the Parisians as much as possible, not to sign peace except at the Tuileries." M. de Miranda then asked whether the count had no fears of a European intervention. "None whatever," was the reply; "the neutrals are at least as much our friends as those of France . . . besides which," he added, significantly, "each of them will, I think, have enough to do to look after its own affairs before long." As to M. Thiers's mission, the count said, "its real object was much less to make peace than to bring about a restoration of the house of Orleans." "I don't think," rejoined M. de Miranda, "that people in Paris thought so. In any case it was said that Russia and England had agreed to interfere." This idea seemed supremely ridiculous to Count Bismarck. "Russia and England agree!" he exclaimed; at the same time laughing loudly, with a glance full of meaning at Count Hatzfeld. "And you Spaniards, are you also going to enter into this terrible coalition against us? I expected that in this war you would have been our allies . . . so much so that the day after war was declared, I asked Marshal Prim what contingent Spain would send us. I was much surprised to see him withdraw from the consequences of his policy. . . . Tell him to reflect. . . . The Latin race is used up; it has accomplished great things, but now its destiny is at an end. . . . The Germanic race is young, vigorous, as full of virtue and initiative as you were formerly. It is to the Northern peoples that the future belongs, and they have only just commenced to play the glorious part which they are destined to fulfil for the good of humanity." "These words," says M. de Miranda, "were spoken with an animation which seemed to exclude all idea of mystification or duplicity. . . . The chancellor spoke as if he were thinking aloud." Then, resuming the

subject of the war, Count Bismarck said that if the present government still refused to treat after the capture of Paris, the Germans will occupy Paris and France "as long as may be necessary." "We will find a government that will treat at last, even if it were that of Robert Macaire. The principal thing we want is to make peace on the conditions we ask . . . the rest to us matters little. And, after all, who can say that the emperor will not return—or, at least, his dynasty? . . . I should not be surprised to see the majority of the nation recall him. . . . *Petit bonhomme vit encore!*" he added, with a laugh; then, turning to Herr von Hatzfeld, "By-the-by, I have just received a telegram; he is coming to-morrow." The individual here alluded to, M. de Miranda afterward found to be General Boyer, the emissary of Marshal Bazaine. "Whatever may be our conditions of peace," Count Bismarck proceeded, "France is too vain ever to forgive us for her defeats. She would in any case make war again as soon as she was strong enough. Our policy, in the interest both of Germany and of all Europe, must therefore be to diminish the territory of France as much as possible, so as to make her unable for a long time to disturb the general peace." The count added, alluding to the proposed annexation of Alsace and Lorraine, that it was the will of the king, and this was enough. "The French, accustomed to be the plaything of political adventurers, cannot understand our respect for the monarchy. In our country there is no sovereign will but that of the king. . . . I am only the instrument of his political will, as the generals are the instruments of his military will. When his majesty expresses a wish, it is my duty to propose the means of realizing it, and it is my glory sometimes to succeed in this task. At this moment, however, my actions are absolutely subordinate to those of the military leaders, who are not always of my opinion." This closed the conversation, which had lasted three hours.

Paris in Siege.

Evening lectures *à propos* of the situation are in course of delivery at the Conservatoire des Arts et Métiers, where General Morin discourses upon the action of powder in fire-arms, and the warming and ventilating of ambulances; Professor Baron Dupin treats of the principles of fortification, strong places, entrenched camps, advanced works, and various accessory defences; Professor Treseu discusses the application of the general principles of mechanics to the construction of engines and machines of war; and Professor Payen descants on alimentary substances in reference to the siege—on meat, blood, gristle, bones, and fat, the theory of nutrition, and similar topics. The most attractive evening amusement appears, however, to be provided at the Paris shooting-galleries, notably those in the Boulevard St.-Michel, where something like half a dozen of these establishments are situated, at which ambitious marksmen are nightly obliged to form a *queue* while awaiting their turns to take aim.

If you are, however, neither for the Paris clubs, the Arts-et-Métiers lectures, nor even for pistol-practice, you are forced to resort to the dimly-lighted boulevards, where you find more than two-thirds of the shops closed, and fully two-thirds of the public lamps unlighted. You take your seat in some more or less deserted *café*; for it is only on special evenings, when rumors abound, that these establishments are at all thronged—before which, while you sip your *mazagran* and puff your *Londres*, the evening papers are noisily hawked. You know, however, that they are unlikely to con-

tain any news, unless by chance an old number of some London daily journal has found its way into Paris through the Prussian lines, when the struggle in front of the *kiosks* to secure copies and learn what has been lately passing in the world outside—for Paris has at length come to feel that she is no longer the world in herself—will be most exciting. Naturally, all the conversation at the *cafés* has reference to the war; and, on days when any thing like an engagement has taken place, the most extravagant rumors ordinarily circulate regarding the number of Prussian prisoners taken and the number of Prussian soldiers slain. Then all the talk will be of listening to no terms of peace until every Prussian has been chased from the national soil. Thus it is the Parisians persist in deceiving themselves with illusions after three months of utmost unvarying reverses.

If you stroll along the boulevards, you no longer encounter those seemingly light-hearted pedestrians whom you commonly associate with the spot; but, in place of them, men more or less grave-looking, and not unfrequently positively depressed, wearing the eternal and perpetual red stripes down the sides of their trousers, with just a few *flâneurs* and such *bouches inutiles* as managed to elude Préfet Kératry's minute researches, besides a swarm of beggars and itinerant traders and musicians. With their stalls placed against the shutters of the closed shops, and by the light of one or more guttering candles, hawkers of purses and photographs, songs and sword-sticks, and, above all, of scurrilous pamphlets and caricatures, will importune passers-by to purchase their worthless wares. "*Demandez la Plainte de Ratapoil Badinquet!*" "*Demandez le Sire de Framboisy, dont la femme danse le cancan avec tous ses amis!*" "*Demandez la femme Bonaparte, ses crimes et ses orgies!*" assail your ears in succession. Every now and then you find your progress interrupted by a knot of open-air politicians, vehemently discussing "the situation," declaiming against an armistice, and demanding that the *sortie* in force be no longer delayed; or a crowd encircling a group of juvenile street-singers, who have endeavored to illuminate the surrounding obscurity by ends of lighted candles placed on the ground in front of them; or gathered round an old man who professes to imitate the notes of all the song-birds; or congregated before a one-legged player on the accordion, who, seated on a camp-stool, rests his wooden leg on a little mat, while a couple of conical-looking dogs, one holding a pipe, the other a tray, in his mouth, squat gravely on other mats in front of him. A row of four wax-candles, protected from the wind by glass shades, light up this singular exhibition, which, now that so little suffices to amuse the Parisians, nightly attracts a considerable crowd.

As may be supposed, the *Petite Bourse* of the Passage de l'Opéra has entirely suspended its operations, and the *cabinets particuliers* of the *Café Anglais* and the *Maison Dorée* are dark and deserted—not a dinner or a supper has been served in *le grand siège* since the city was first invested. Before the doors of the theatres there are neither carriages nor noisy *touters* nor jostling crowds. A few people will perhaps stop for a moment when some *voiture* drives up at a slow pace and deposits a wounded soldier into one or the other ambulance.

The weary evening has at last whiled itself away. At half-past ten the last lights in the *cafés* are put out, and the *cafés* themselves are closed. You walk home through the silent and deserted streets, utterly regardless of the midnight robber who used to be in wait in gloomy *portes cochères*; for you know that armed men

are certain to be within call even in the least-frequented thoroughfares. Suddenly footsteps are heard approaching, and a sombre mass turns a corner of the boulevard, and proves to be a patrol of National Guards defiling past in silence. Occasionally they direct their steps to some lofty house, where a light has been seen moving *au cinquième*, and forthwith proceed to arrest the astonished occupant of the attic on the pretence that he has been signalling to the Prussians, of whom, although we see them not, we are incessantly reminded, and more than ever at this moment, when the distant booming of the cannon breaks the stillness of the night.

Parisian Dinners.

From a Paris Letter, November 29, 1870.

In ordinary times, when all Europe laid itself under contribution to enable Paris to dine sumptuously, with the majority of Parisians their dinner formed the serious occupation of the day; and even now, with empty larders and a girdle of half a million Prussians encircling us to prevent our replenishing them, the *menu* is still a matter of the gravest consideration. We have indulged in dishes which the *gourmets* of the Anthropological Society of London might well envy: bear, buffalo, and bison; yak, elk, and reindeer; ostrich, swan, and cassowary; dog, cat, rat, and guinea-pig—not to mention mule and ass. In a very few days, however, we shall all be constrained to revert to "the noblest conquest ever made by man over Nature," as Buffon grandly puts it, the supply of which is believed to be still considerable. Of course, after having devoured your three-days' rations at a single sitting, even if you restrict yourself to one meal *per diem*, you have to dine at a restaurant until your rationing day comes round again, and in this case require to exercise some discretion with respect to the establishment you patronize. If your purse is sufficiently long to admit of your expending a napoleon on wine to every franc's worth of animal food you consume, the entire resources of Paris will be open to you at Bignon's or Brebant's while you may be quite certain that those restaurants which offer you "*Filet Chateaubriand* and *filet de bœuf aux champignons*," *ad libitum*, simply serve you "*la viande de cheval*" under this assumed guise. Customers feeling perfectly satisfied of this will jocularly order "*un filet de cheval sans sel (selle)*." Indeed, this almost universal consumption of horseflesh has given rise to endless pleasantries. When the government first decided to fix the price of horse, people inquired whether it would be by the hour or by distance, and it has recently been suggested to change the habitual formula "*Monsieur est servi*" into "*Monsieur à cheval*." Only the other day I observed three slaughtered horses being delivered, between the lights, as we say, at the Grand Hôtel. The celebrated *table d'hôte* at this establishment having been but poorly attended for weeks past, one has observed a standing advertisement in the newspapers to the effect that "any respectably-dressed person will be admitted to dine there at eight francs per head, wine not included," apparently anticipating a rush of blouses at this figure. Eight francs per head for unquestionable horseflesh, the prime parts of which are sold by government decree at nine pence per pound, looks very like famine prices. At certain restaurants strangers are politely informed that dinners are only served to the regular *clientèle* who have handed over their ration-cards to the proprietor; and, at the *établissements de bouillon*, where most of the Garde Mobile dine when not on duty at the ramparts or the advanced forts, and which on

this account appear to be favored as regards their meat-supply, a notice has appeared for weeks past over their doors, warning customers that by order of the authorities only one plate of meat will be supplied to each person—said plate, too, consisting of certainly not more than half a dozen mouthfuls. Should you decide to patronize one of the “prix fixe” establishments, such as the “Diner de Paris” and the like, the following is the style of *menu* that will be submitted to your choice:

Hors-d'œuvres.—Sardines à l'huile, Saucisson de Lyon (ass or horse, but commonly understood to be the former), Boudin de table arille, and Boudin noir et blanc (horse).

Potages.—Vermicelle, Consomme, Pâté d'Italie (the bouillon, or soupe, being, of course, made of horseflesh.)

Poisson.—Morue saled, Harengs saurs.

Entrées.—Pieds de mouton poulette, Foie sauté Lyonnaise, Rognons sautés (bullock's or horse's liver, repeated in another form), Bœuf à la Bourgogne (horseflesh), Bœuf fumé façon Hambourg (ditto), Cœurs de mouton au riz, Côtelettes de porc saled, Filet de mulet à la reine d'Espagne, Tripe à la mode de Caen.

Rôtis.—Anon rôti (juvenile donkey).

Volaille.—None.

Gibier.—None.

Légumes.—Salsifis frits, Choux, Pommes de terre sautées.

Entremets.—Beignets soufflés, Gelée aux fruits.

Dessert.—Noix, Noisettes.

Fromage.—None.

The deputation of the Federal Parliament, which is to offer the crown of Germany to King William, is headed by President Simson, who, as Speaker of the Frankfort Parliament of 1848, made the same offer, but in vain, to King William's brother and predecessor.

Miscellany.

Alexandre Dumas.

PARIS was undoubtedly, above all European cities and capitals, a centre and focus of the human intellect, of the liberal arts, and of all the graces and accomplishments that distinguish the most refined societies from barbarous tribes or mere industrial agglomerations. Paris was not only the arbitress of taste and fashion in clothes and cookery, but the quintessence of a most composite national genius, in which something of German solidity was mixed and fused with the tenacious temper of the Norman, the gloomy imagination of the Breton, the free and fiery humor of the Gaul, the volatile exuberance of the Gascon, the volubility and acuteness of the Greek. French literature, with its exquisite sharpness and polish, was the mint—as German literature, with its prodigious depths of exploration, was the mine—of the thought, the wit, and the knowledge of mankind. No other literature had the same marvellous radiating power, the same luminous clearness, and brightness, and communicative charm. One hears with interest that the Académie des Sciences meet and read their papers as usual, with all the calmness of an Archimedes. But what has become, during these ninety days of imprisonment, of the inexhaustible play-writers, the incomparable story-tellers, the delightful essayists, whose language was universal, and whose dominion was one on which the sun never set? Twenty years of imperialism had, it is true, smoothed the declivity and the decline of intellectual France. The second empire subsisted, with scarcely an exception, upon the literary glories of the restoration and the monarchy of July. All the essayists and the philosophers belonged to the opposition, and of the novelists and the dramatists only About and Dumas the young-

er, and Sardou and Octave Feuillet, and Flaubert, could be counted among the products, or at any rate the contemporaries, of the Napoleonic decadence. And all of these were, like the Roman poets of the Augustan epoch, the descendants of a freer race—*progenies villosior*.

Among the few surviving figures of an era of political and social renovation there towered from time to time, but more seldom of late years, on the Boulevards of Paris, vast alike in bulk and in brain, one colossal survivor of the age of literary giants—Alexandre Dumas the elder, and (as no one has more gracefully and feelingly insisted than his son) Alexandre Dumas the greater. Dryasdusts who, for the best reasons in the world, would shut out from the domain of pure literature all that is not useful, ponderous, and unreadable, may pretend to treat the claims of the author of “Monte Christo” as those of a magnificent mountebank or buffoon, because he only wrote stories and plays and fugitive papers, which have delighted thousands upon thousands of his fellow-creatures, and charmed away their sorrows or their cares. Of course it is easy and perfectly correct to say that Alexandre Dumas, during forty years and more of incessant labor and prodigious variety of production, penned an immense amount of trash which the world has very willingly let die, and was at least the putative father of an innumerable worthless literary off-spring. It is not to the *feuilleton* that one turns for doctrine, for instruction, for edification, for sound learning, and profound scholarship. Yet, when the *feuilleton* was signed by a Balzac or a Dumas, there was often to be found in that dingy ground-floor of the daily paper a wealth of imagination, a fertility of invention, a depth and acuteness of observation, an abundance of life and character and incident, enough to make the fortunes of a thousand plagiarists and imitators, and to amuse the leisure moments of generation after generation of readers in all countries, and of all ranks and conditions. A man who can write such a story as “Monte Christo” is, in sober earnest, a sort of benefactor to the human race. No doubt, as the president of the Assize Court of Rouen remarked, when Dumas, in the witness-box, told the usher of the court that were he not in the native town of Corneille he should call himself a dramatic author—“There are degrees.” Still, any man who contributes half as much as Dumas has contributed to the harmless intellectual recreation of his fellow-creatures (for, with comparatively few exceptions, his works are as surprising for their inoffensive morality as for their audacity of design and exuberance of dialogue), deserves to be counted, after his kind, among those who have done faithful service in this sublunary world. And, for our part, we are not ashamed to confess our gratitude for many a pleasant hour to the great “romancist,” who is now beyond the reach of censure and of admiration.

Alexandre Dumas was really a phenomenal creature, an astounding compound of natural forces, a sublime instance of “variety of species.” Neither France alone, nor even Paris, could have given birth to such a prodigy. Paris might have produced the skilful dramatist, the ingenious novelist, the ever-ready *feuilletonist*; but the overpowering luxuriance of Dumas was tropical. The inordinate personality of the man was African. It was the strong dash of “color” in his veins that made his self-complacency so colossal, and bore him triumphant over difficult circumstances and an obscure condition, over cliques of critics and satirists, over jealousy and envy and ridicule, and his own enormous vanities and absurdities. He had the taste, the appetites, the splendor, and ostentation of a negro, and with all this an

almost pathetic instinct of chivalrous sensibilities, of generous devotion and self-sacrifice, and, as occasional touches in his plays and novels show, a singular gentleness and delicacy of feeling. What might have been grossness or coarseness in the pure African became refined rather than corrupted by the French *finerie* and the Parisian self-culture. Unlike the Parisians of pure blood, his most questionable scenes of sensual passion never degenerated into sheer indecency and nastiness.

Tennyson's New Poem.

Alfred Tennyson has just published a new poem, set to music, entitled “The Window; or, the Songs of the Wrens.” It is very slight in quantity as well as quality, and consists of only twelve short songs, of which the following are the best:

I.

ON THE HILL.

The flights and shadows fly!
Yonder it brightens and darkens down on the plain.
A jewel, a jewel dear to a lover's eye!
Oh, is it the brook, or a pool, or her window-pane,
When the winds are up in the morning?

Clouds that are racing above,
And winds, and lights, and shadows that cannot be still,
All running on one way to the home of my love,
You are all running on, and I stand on the slope
of the hill,
And the winds are up in the morning!

Follow, follow the chase!
And my thoughts are as quick and as quick, ever
on, on, on,
Oh, lights, are you flying over her sweet little
face?
And my heart is there before you are come and
gone,
When the winds are up in the morning!

Follow them down the slope!
And I follow them down to the window-pane of my
dear,
And it brightens and darkens and brightens like
my hope,
And it darkens and brightens and darkens like my
fear,
And the winds are up in the morning.

VI.

THE LETTER.

Where is another sweet as my sweet,
Fine of the fine, and shy of the shy?
Fine little hands, fine little feet—
Dewy blue eye.

Shall I write to her? shall I go?
Ask her to marry me by-and-by?
Somebody said that she'd say no;
Somebody knows that she'll say ay!

Ay or no, if asked to her face?
Ay or no, from shy of the shy?
Go, little letter, apace, apace,
Fly!

Fly to the light in the valley below—
Tell my wish to her dewy blue eye:
Somebody said that she'd say no;
Somebody knows that she'll say ay!

X.

AT 1

Be merry, all birds, to-day,
Be merry on earth as you never were merry before.
Be merry in heaven, O larks, and far away,
And merry for ever and ever, and one day more.
Why?
For it's easy to find a rhyme.

Look, look, how he flits,
The fire-crowned king of the wrens, from out of
the pine!
Look how they tumble the blossoms, the mad little
flits!
“Cuck-oo! Cuck-oo!” was ever a May so fine?
Why?
For it's easy to find a rhyme.

Oh, merry the linnet and dove,
And swallow and sparrow and throstle, and
have your desire!
Oh, merry my heart, you have gotten the wings of
love,
And fit like the king of the wrens with a crown
of fire.
Why?
For it's ay ay ay. ay ay.

XII.

MARRIAGE MORNING.

Light, so low upon earth,
You send a flash to the sun.
Here is the golden close of love,
All my wooing is done.
Oh, the woods and the meadows,
Woods, where we hid from the wet,
Stiles where we stayed to be kind,
Meadows in which we met!
Light, so low in the vale,
You flash and lighten afar:
For this is the golden morning of love,
And you are his morning star.
Flash, I am coming, I come,
By meadow and stile and wood:
Oh, lighten into my eyes and my heart,
Into my heart and my blood!
Heart, are you great enough
For a love that never tires?
O heart, are you great enough for love?
I have heard of thorns and briars.
Over the thorns and briars,
Over the meadows and stiles,
Over the world to the end of it
Flash for a million miles.

Varieties.

THE oldest stove probably in the United States, is the one which warms the capitol at Richmond, in Virginia. It was made in England in 1770, and warmed the House of Burgesses for sixty years, before it was removed to its present location, where it has been for thirty years. It has survived three British monarchs; has been contemporaneous with four kingly monarchies, two republics, and two imperial governments in France. The great American republic has been torn by internal strife, the breach partly healed, and still the old stove remains the same, unmoved in the midst of all.

Among the most important discoveries of the German Arctic Expedition was a new land, about thirty-six nautical miles east of Spitzbergen, and situated north of the seventy-seventh degree of latitude. This territory is larger than Spitzbergen, and presents a very wild and rugged appearance, being filled with almost perpendicular mountains and cliffs.

There are nearly seven thousand French Canadians employed in the factories and workshops of Connecticut. The region along the St. Lawrence is prolific in quiet, industrious laborers; and, as it does not produce very much of anything else, the young people have emigrated in large numbers to the adjacent New-England States.

A sick man, slightly convalescing, was asked by a pious friend who his physician was. He replied: "Dr. Jones brought me through." "No, no," said his friend, "God brought you out of your illness, not the doctor." "Well, maybe He did, but I am certain the doctor will charge me for it."

An escaped menagerie elephant played burlar in St. Louis a few nights ago, forcing open several houses and frightening the female occupants, and being driven away from one of them only by the blows of a sword on his trunk. He died of cold in the streets before morning.

"Horse," says Changarnier, "is not bad eating, with bread and salt, when the horse is fat." But an Englishman, on the other hand, who has no relish for French tricks and manners, sings:

"I cannot eat the old horse,
The horse I used to ride."

Scotland has three thousand eight hundred and ninety-five places of worship.

A French man-of-war and a German merchantman that had sailed in company for several days, exchanging friendly signals, entered the harbor of Sydney, September 4th, when they first learned that war existed.

A man in Milwaukee, who professed to be engaged in the "construction of a six-bladed horse and a leather frying-pan," was taken to a lunatic-asylum.

Gardeners mind their peas, actors mind their cues; but church-wardens, instead of minding their p's and q's, very often give their attention to their pews and keys.

THE architecture of the Dyaks, in Borneo, is very peculiar. The houses are all built on posts, some of them twenty feet in height, and the mode of access to them is by climbing up a notched pole, which answers the purpose of a ladder. The chief dwelling in every village, and indeed, practically, the village itself, is a long house, which is of wonderfully-large dimensions, sometimes more than five hundred feet long, and inhabited by as many as five hundred people. Throughout the entire length of the house runs the broad veranda, or common room, which is open to all the members, and at the side are rooms partitioned off for the different families. Although the veranda is common ground to all the tribe, each family occupies by tacit consent the portion of the veranda opposite their own rooms. These rooms are strictly private, and none except the members of the family, or their intimate friends, would think of entering them. The chief, or *orang-kaya*, of the long house has a much larger room than the others, and the space in front of his room is considered to be devoted to the use of the lesser chiefs and councillors. One of the rooms inhabited by the *orang-kaya* was visited by a traveller, who describes it as not an attractive apartment. On each side of the entrance there was a piece of furniture somewhat resembling an old English plate-rack, upon the lower shelf of which was placed a flat stone. A large fire was burning on the stone, and on the range above were wood, rice, pots, and other utensils. There was no chimney to the house, but a sort of flap in the roof was lifted up, and kept open by a notched stick. This flap answered both for window and chimney, and when it was closed the room was in total darkness, besides being at once filled with smoke. A number of fire-places, varying according to the population of the house, are arranged along the veranda, and, as a general rule, one of the primitive ladders is placed at either end, so that, when a visitor enters the house, he sees throughout its entire

length, the range of his eye being only interrupted by the posts, which, after supporting the floor, pass upward, and serve also to support the roof. Outside this veranda extends another, called the outer veranda. It has no roof, and is exposed to the blazing sunbeams. It is used, not as a habitation, but as a kind of storehouse and drying-ground. As the flooring is made of bamboo, the Dyaks can easily, if they choose, keep the interior of their rooms clean. This, however, they seldom choose to do, limiting their cleanliness to the simple process of sweeping any offal through the floor, so as to fall under the house. They never think of removing it after it has fallen, so that by degrees the heap of refuse becomes higher and higher, and gradually diminishes the distance between the floor of the house and the soil beneath.

The reasons for building the Dyak houses on piles are several, the chief being that such a house acts as a fort in case of attack. The custom of building on piles is universal, but only those tribes that are liable to invasion employ piles of the height which have been mentioned. This mode of architecture also protects the inhabitants from floods and from the intrusion of reptiles. The Dyaks do not use the bow and arrow, and, before they learned the use of fire-arms, a house built on piles, some twenty or thirty feet in height, made a very secure fort, which could not be fired, and which exposed the storming party to certain and heavy loss. Even since the English have taken up their residence in Borneo, some of these houses, belonging to revolted chiefs, have given great trouble before they could be taken, artillery appearing to be the only weapon to which they at once succumb. The piles are made of the hardest ironwood, and are very thick, much thicker than is needed for the support of the house. The reason for this strength and thickness is, that, in case of attack, the assailing party dash under the house, protecting themselves from missiles by a canoe which they turn keel upward, and hold over their heads while they chop at the posts, so as to bring the house and its defenders down together. If the posts are but moderately stout, they will sometimes succeed; but, if they are very thick and strong, the defenders can remove part of the floor, and throw on the attacking party weights sufficiently heavy to break through their roof and kill them.

The thatch, as well as a considerable portion of the material, is obtained from the nipalm, a tree which to the Borneans is almost a necessity of existence, and supplies a vast number of their wants. It grows in large numbers at the water's edge; its huge leaves, fifteen or twenty feet in length, projecting like the fronds of vast ferns. When dried, the leaves are woven into a sort of matted fabric, called "ataps," which is used sometimes as thatch, sometimes as the indispensable covering of boats, and sometimes even as walls of houses, the mats being fastened from post to post. By the use of these ataps, certain portions of the roof can be raised on sticks in trap-door fashion, so as to answer the double purpose of admitting light and securing ventilation.

In the olden times, when a long house was projected, the erection of the first post was always accompanied by a human sacrifice. A deep hole was dug in the ground, and the huge post was suspended over it by rattan lashings. A girl was laid at the bottom of the hole, and at a given signal the lashings were cut, permitting the post to drop into the hole, crushing the girl beneath its weight.

These houses are often approached by bridges which are very curious structures, so ap-

parently fragile that they seem unable to sustain the weight of a human being, and of so slight a character that to traverse them seems to imply the skill of a rope-dancer. As these houses are often built on the side of a steep hill, a pole is laid from the platform to the hill, and, if it be a tolerably long one, supported by several rattan ropes fastened to trees. A very slight bamboo hand-rail is fastened a little above it, and the bridge is considered as complete. One of these simple bridges is shown in our second illustration. Near the foreground is a man engaged in making fire by means of twirling one stick upon another, after the manner of savage tribes. There is, however,

A Dyak Village.

A Dyak House.

one improvement on the usual mode. Instead of merely causing a pointed stick to revolve upon another, the Dyaks use instead of the lower stick a thick slab of very dry wood, with a deep groove cut on one side of it, and a small hole on the other, bored down to the groove. When the Dyak wishes to procure fire, he places the wooden slab on the ground with the groove underneath, and inserts his pointed stick in the little hole and twirls it rapidly between his hands. The revolution of the stick soon causes a current of air to pass through the groove, and in consequence the fire is rapidly blown up as soon as the wood is heated to the proper extent.

THE RECOVERY OF JERUSALEM.*

THIS is the somewhat pretentious title of the narrative of recent English explorations of Jerusalem, by means of excavations conducted by Captain Wilson, of the Royal Engineers, under the auspices and at the expense of the Committee of the Palestine Exploration Fund. Without, perhaps, fulfilling the meaning of the old crusading war-cry,

exact knowledge of the scenes and localities in which their religion first appeared on earth. The explorations have solved many difficult problems, and settled many fierce and protracted controversies. Shafts have been sunk and tunnels made in the most secluded and mysterious parts of the sacred city, and structures brought to light that have not

WILSON'S ARCH, DISCOVERED AT JERUSALEM IN 1867.

the "Recovery of Jerusalem," it is undoubtedly a record of researches and discoveries of the highest value, and of the greatest interest to scholars, antiquarians, and, above all, to Christians who desire an

been seen by mortal eyes since the days of Titus, or perhaps of Solomon.

The beginning of this great work was the Ordnance Survey of Jerusalem, made by Captain Wilson, of the English Royal Engineers, in 1864-'65. Early in the year 1864 the sanitary state of Jerusalem attracted considerable attention; that city, which the Psalmist has described as "beautiful for situation, the joy of the whole earth," had

ROBINSON'S ARCH.

become one of the most unhealthy places in the world, and the chief reasons assigned for this melancholy change were, the inferior quality of the water, and the presence of an enormous mass of rubbish which had been accumulating for centuries. With the rubbish it was hardly possible to deal, but the water-supply seemed an easier matter, and several schemes were proposed for improving it, either by repairing the ancient system, or by making new pools, cisterns, and aqueducts. Before, however, any scheme could be carried out, it was necessary to obtain an accurate plan of the city, and with this view Miss Burdett Coutts placed a sum of five hundred pounds in the hands of a committee of gentlemen interested in Jerusalem.

The committee obtained from Lord de Grey, then Secretary of War, the services of a party of Royal Engineers, under the command of Captain Wilson, who reached Jerusalem on the 3d of October, 1864, and by whom the survey seems to have been made in the most thorough and satisfactory manner. He was followed in February, 1867, by Captain Warren, of the Royal Engineers, with a party of assistants, by whom the excavations were made, the record of which fills the greater part of this volume.

But, before entering into any details of these explorations, it may be well to lay before those of our readers who are not familiar with the subject a slight sketch of the topography of the Holy City.

Jerusalem is emphatically a mountain-city. The Bible teems with allusions to this peculiarity in its situation. Built on the very backbone of the country, the summit of that long ridge which traverses Palestine from north to south, and only approached by wild mountain-roads, the position of the city was one of great natural strength, and this gave the inhabitants that feeling of security from hostile attack which seems to be implied by the Psalmist in the well-known verse, "As the mountains are round about Jerusalem, so is the Lord round about his people." The modern city stands, as the ancient one did before it, on the southern extremity of a spur, or plateau, enclosed by two ravines, which bear the familiar names of Kedron and Hinnom. The ravines rise at the water-shed within a short distance of each other, at an altitude of twenty-six hundred and fifty feet above the Mediterranean; the easternmost, the valley of Kedron, or Jehoshaphat, runs eastward for one and a half miles, and then makes a sharp bend to the

south; the westernmost, the valley of Hinnom, after following a direction nearly south for one and a quarter miles, turns to the east, and, passing through a deep gorge, joins the Kedron at Bir Eyûb, a deep well south of the city. Both ravines are at first mere depressions of the ground, but after the change in their respective courses they fall more rapidly, and at Bir Eyûb are six hundred and seventy feet below the original starting-point. A third ravine, the Tyropœon—valley of the Cheesemongers, or perhaps Tyrians—rises well up in the plateau, and, after passing through the city and dividing it into two unequal halves, joins the Kedron at Siloam. On the eastern spur, Mount Moriah, once stood the temple of Solomon, Zerubbabel, and Herod, and on the western, which is one hundred and twenty feet higher than Moriah, were situated the palace of Herod, the three great towers Hippicus, Phasaelus, and Mariamne, and the Upper City of Josephus.

The sides of the valleys of Kedron and Hinnom are now encumbered with rubbish, but they are still sufficiently steep to be difficult of access, and every here and there places are found where the rock has been scarped or cut perpendicularly downward to give additional security. It was probably in these natural defences which protect the city on the south, east, and west, that the Jebusites trusted when they boasted to David, "Thou wilt not come in hither; the blind and lame shall drive thee back." The only side on which the city could be attacked with any chance of success, was on the north; and here, as Josephus tells us, it was defended by three walls of great strength, able, before the introduction of gunpowder, to offer a stubborn resistance to any force brought against them.

The modern city is entirely surrounded by a massive, well-built wall, provided with numerous flanking towers, and is protected on the north by a ditch partly cut in the rock. There are five gates now open, and five closed; of the former the Jaffa Gate is on the west, the Damascus Gate on the north, St. Stephen's on the east, and the Sion and Dung Gates on the south. Of the latter, the Bab az-Zahiré is on the north, the Golden Gate on the east, and the Single, Double, and Triple Gates on the south. The plateau, on which the city stands, slopes uniformly to the southeast, and contains about one thousand acres; it is of tertiary limestone, and the upper beds provide an extremely hard compact stone, called, by the Arabs, "mezzeh," while

the lower, in which most of the ancient tombs and cisterns have been cut, consist of a soft white stone, called "melekeh."

On Mount Moriah, there is now a large, open space, called Haram esh-Sherif, a place of peculiar sanctity in the eyes of all true Moslems. Its surface is studded with cypress and olive, and its sides are surrounded in part by the finest mural masonry in the world. At the southern end is the Mosque el Aksa, and a pile of buildings formerly used by the Knights Templar; nearly in the centre is a raised platform paved with stone, and, rising from this is the well-known mosque, Kabbet es-Sakhra, with its beautifully-proportioned dome. Within this sacred enclosure, the Sanctuary, as we may well call it, stood the Temple of the Jews; all traces of it have long since disappeared; not one stone has been left upon another, and its exact position has for years been one of the most fiercely-contested points in Jerusalem topography. The two theories which have obtained the largest number of supporters, are, first, that which makes the Temple enclosure coextensive with the Sanctuary; and second, that which confines it to a square of six hundred feet at the southwestern corner of the same place. It is still uncertain which of these two views is correct, and the question can hardly be definitely settled till excavations are made within the Haram walls. On one point all are agreed, that the magnificent triple cloister, the Stoa Basilica, built by Herod, stood on the top of the southern wall, and the appearance of this, when perfect, must have been grander than any thing we know of elsewhere. It is almost impossible to realize the effect which would be produced by a building longer and higher than York Cathedral, standing on a solid mass of masonry almost equal in height to the tallest of our church-spires; and to this we must add the dazzling whiteness of stone, fresh from the mason's hands.

The western hill is thickly covered with houses, except on the west, where there is an open space, occupied by the gardens of the Armenian Convent. At the northwest corner is the citadel with its three towers, representing, probably, those built by Herod the Great, and, adjoining them, on the south, are the barracks of the Turkish garrison. One of the towers, that known as the Tower of David, stands on a mass of solid masonry, decidedly Herodian in character, and its dimensions agree well with those of the tower Phasaelus, as given by Josephus; another, which now protects the Jaffa Gate, is

smaller, and may, perhaps, be identified with the tower Hippicus, as, on an examination of an ancient cistern beneath, the remains of an aqueduct were found which formerly brought water into the city at that point.

Along the northern side of the hill, a street runs from the Jaffa Gate on the west, to the Sanctuary on the east, following, apparently, the course of a small, lateral branch of the Tyropeon Valley. North of this line stretches the Christian quarter of the town, rising gradually to the northwest, till it reaches the corner of the modern wall at Kalat Jalûd, a ruined castle, supposed by some writers to be the tower Psephinus, of Josephus. Nearly in the centre of this quarter lies the Church of the Holy Sepulchre, which is said to contain within its walls the Tomb of our Lord. At the time of the Crucifixion, the Sepulchre was without the walls, now it is well within them. Some writers explain this by saying that, after Constantine built his Church of the Resurrection, the town spread out and surrounded it, while others are equally certain that the present site must have been within the limits of the ancient city, and that we must look elsewhere for the Sepulchre, and even for the church built by Constantine. The solution of this difficult question depends on the course of the second wall which surrounded the city; if it ran to the east of the church, there is no reason why the present tradition should not be correct; if it ran to the west, the tradition must be wrong. Up to the present time, no one has seen any portion of this wall; the point from which it started and that at which it ended are alike unknown. It was, however, ascertained, during the progress of the survey, that the old arch near the south end of the bazaars, called the Gate Gennath, was a comparatively recent building, and that the ruins near the Church of the Holy Sepulchre, which had been pointed out as fragments of the second wall, were really portions of a church.

There is, in addition, a fourth hill north of the Sanctuary, and rising one hundred feet above it, which apparently corresponds to the Bezetha of Josephus. It is now principally occupied by Moslem houses, but the Sœurs de Sion have built a convent on its northern slope, and on its western face are the British and Austrian consulates. Immediately to the east of this hill is a small valley, which falls into the Kedron, about one hundred yards south of St. Stephen's Gate; on its left bank stands the church of St. Anne, and in its bed has been

RUINS OF CAPERNAUM.

THE SPRING OF HESBAN.

SINAI.

formed the traditional pool of Bethesda, called, in the most ancient manuscripts of the New Testament, Bethzatha, a name not unlike that of the fourth hill, Bezetha.

It is hardly possible, in a short paper like the present, to give any detailed description of the ancient buildings and traditional localities within and around Jerusalem. The two places of greatest interest are the Church of the Holy Sepulchre and the Sanctuary, and most of Captain Warren's excavations were made in the immediate vicinity of the latter.

Captain Warren's excavations near the Sanctuary were made in the face of many difficulties and dangers. In fact, they appear to have been carried on at the constant risk of life and limb to the bold explorers. The whole series of their progress was a succession of lucky escapes. Huge stones were day after day ready to fall, and sometimes did fall, on their heads. One of the explorers was injured so severely, that he could barely crawl out into the open air; another extricated himself with difficulty, torn and bleeding; while another was actually buried under the ruins. Sometimes they were almost suffocated by the stifling heat; at other times they were plunged for hours up to their necks in the freezing waters of some subterranean torrent; sometimes blocked up by a falling mass, without light or escape. And these labors had to be carried on, not with the assistance of those on the spot, but in spite of the absurd obstacles thrown in the way of work by that singular union of craft, ignorance, and stupidity, which can only be found in Orientals—workmen who in "winter could never get the idea drummed into their heads that working would make them warm"—Turkish dignitaries, believing that the sacred rock lies on the top leaves of a palm-tree, from the roots of which spring all the rivers of earth, and with a ready pretence for evading every request.

The results of the work, so far as it has been carried on, may be briefly summed up, thus:

1. Several ancient aqueducts and many ancient cisterns have been discovered, and the much-vexed question of how Jerusalem was supplied with water in the days of Solomon practically settled.

2. Considerable progress has been made in determining the course of the ancient walls, on which depends the authenticity of the Holy Sepulchre. The discoveries made tend to confirm its genuineness.

3. Important materials have been furnished toward the decision of the controversy respecting the area of the Temple.

4. The external aspect of ancient Jerusalem is in two or three points brought out with new force.

There are some proofs discovered of the form of the ancient houses.

There is also the astounding revelation of the immense height of the Temple wall above the Kedron Valley.

5. Some approximation to the date of the walls of the Temple has been made by the discovery of the supposed Phœnician characters marked in red paint on their surface.

6. The interesting discovery by Dr. Robinson of what he supposed to be the arch of the bridge, which later travellers much contested, has now been definitely confirmed by the disclosure of its remaining fragments.

7. The whole history of the cartography of Jerusalem is for the first time clearly set forth, while it has reached its best illustrations in the maps and contours now for the first time published.

Outside of Jerusalem the explorers have made great additions to our knowledge of the Holy Land. The Lake of Gennesareth, or Sea of Galilee, has been described more accurately and vividly than ever before, and at least a very near approach has been made, if not absolute certainty obtained, in fixing the hitherto uncertain locality of the places where the Saviour resided, Capernaum, Bethsaida, and Chorazin. The site of Capernaum has been identified almost beyond doubt.

The objects of pottery—described by Mr. Chester—open a new sphere of sacred archaeology hitherto almost untouched; the peculiarity of those in the early Christian era seems well worth noticing.

Of all the discoveries connected with the Palestine Exploration Fund, that of the Moabite Stone, if not the most important, is undoubtedly that which has excited the keenest and most general interest, and deservedly so.

1. It is the only inscription which has hitherto been found reaching back to the age of the Jewish monarchy.

2. It indicates the possibility—one might almost say the certainty

—that more such inscriptions might be discovered, if only we had the means of searching for them. It removes the disagreeable impression that, as no written record on stone had ever been found, no such record had ever existed. Strange, almost incredible, as this seemed, when compared with the acres of inscriptions (many of a much earlier date) in Egypt—yet it was a not unnatural conclusion, until this unexpected discovery broke the silence and dispelled the illusion.

3. Whether or not the King of Moab who is mentioned in the same "Mesha" as the monarch of whom we read in 2 Kings iii., he evidently belongs to the same dynasty. The few indications that the inscription contains of the state of Moab agree with those contained in the Sacred Books.

Whatever may be the variations of readings in other parts of the inscription, there is an entire agreement as to some of the most interesting parts. The name of Mesha, the names of Chemosh and Moloch, the name of Omri, the names of the various Moabite towns, above all, the name of Jahveh, or Jehovah, for the God of Israel, appear in both the versions here presented to us. The book gives the various versions of the inscription and the most accurate account of the discovery of the stone.

The most important and interesting question decided by this volume is, however, unquestionably that of the exact location of Mount Sinai, and of the route by which the Israelites passed through the desert.

The spot of the passage of the Red Sea—the course of the Israelites by the Wady Useit and the Wady Tayibeh—the identification of the Wilderness of Sin with the plain of El Murkhah—the identification of Rephidim with Feiran, and of the sacred hill of Aaron and Hur with the eminence crowned by the ruins of Paran—the identification of the Ras Sufsáfeh and the plain of Ráhab with the scene of the giving of the law and the Israelite encampment—the general failure of the ancient names—the probable change in the resources of the wilderness—the comparatively modern date of the Sinaitic inscriptions—all these points have now been established, as far as they are likely to be, by explorers who can speak with authority, as the first who have traversed, not one route only, but every possible route in the Desert, and have seen, not one or two only, but every possible scene of the great acts of the Exodus.

In conclusion, to quote the words of the learned Dean Stanley, himself one of the best of the explorers of the Holy Land, who says in his introduction to the work: "We commend this volume to the serious attention of all who care for the additional light which sincere desire for truth and patient investigation can throw on the most sacred of all books, on the most interesting of all geographies. Much has been done, but much remains to be done; and it is in order to stimulate and insure the completion that this instalment is given to the world. May that completion be worthy of the beginning, worthy of the indefatigable zeal and labor which first set on foot this new Crusade, worthy of the Holy Land and the Holy History which it is intended to illustrate and elucidate!"

DAISY'S TRIALS.

IN SEVEN CHAPTERS.—CHAPTER VII.

MEANWHILE Daisy travelled all day. By road, by rail, by road. Lastly, she found herself, or thought herself, obliged to walk, a long walk of weary up-hill miles. By the time she had accomplished half this walk her limbs were hardly able to support her, her brain hardly able to be her guide. Her strength so failed and flagged that she feared to fall by the way.

By-and-by she turned out of the rough deep lane into an open field, to sit and rest under a hedge, where she was hidden from any chance passer-by, where yet the wind might blow upon her. It was a hot eerie sort of wind that was blowing that night. There had been a long drought, every thing had a crisp dryness; the silence of the time and of the solitary place was full of strange little sounds, each one of which startled poor timid Daisy, and set her heart beating in her ears. The dry leaves rustled on the trees, the bushes rustled as any bird or other small creature moved in them, the tall dry grasses rustled, and the ripe wheat on the other side the hedge. And all the innocent little sounds seemed to Daisy fateful and terrible, and she felt so ill, so deadly faint and ill.

No food had passed Daisy's lips that day. Mrs. Moss's care had

provided her with some, but she had forgotten and left behind the little bag into which it had been put; as she had, also, forgotten and left behind her a small portmanteau, losing sight of it at a station where she had changed lines. This evening there was no darkness, and there would be no darkness this night, for the moon was near the full, and the wind-swept sky was cloudless. Daisy felt as if she would have been glad of darkness; the moonlight made her head giddy. As she sat there, trying to rest, and to steady herself, every thing swam before her. Yet she dared not close her eyes and so try to rest her brain, for the fear they might not again reopen.

To faint there! To die there! The thought was dreadful. She imagined herself being found, when the morning sun fell upon her, by some laborer going to his work; imagined rough tongues and rough hands busy with her, and thought of the horror of it all to Kenneth Stewart when he should come to know, as there was no hope but he would come to know. This thought nerved her to attempt to get on again. How much she would have given for one glass of wine, and one small crust of bread, for a draught of milk, even! but, though she knew there was a farm-house in easy reach, where all these things were attainable, she shrank from being seen wandering alone so late. Just as she had risen to go back into the lane, Daisy became aware of an advancing footstep; she cowered down till it should have gone by. If it should stop at the gate, if it should enter the field, she believed she should die of fright. But the step went harmless on; was, probably, she thought, that of some late laborer returning from his distant work. She waited till she could hear it no longer, till it must have got far ahead, then went back to the lane and struggled up it; after an hour of pain and difficulty coming in sight of the roof of Moor-Edge farm.

There was from this point a shorter way of reaching the house than by keeping between the high hedges, a footway across the great steep field beneath it, now tented with corn-stooks. Daisy took this way. A little while and she could see all the windows of this side of the house; they were all closely shrouded. Walking on with her eyes fixed on the house, her feeble feet presently stumbled over something; a something that cried out with a plaintive little cry.

Daisy looked down: that something looked up. The moonlight shone full on the wistful face of a child who, curled up near one of the corn-stooks, had fallen asleep forgotten. Forgotten by whom? Why did it never occur to Daisy to think that it had been forgotten by one of the women working in the field? Why did Daisy at once (as if in the world there were but one child) take it for granted, with her heart, that this child was her own? To find it there, forgotten, told her fully what was the great trouble fallen on the house, and of the helplessness of the one who had been its helper. It was the foster-mother, then, and not the child whom death had taken. The hurried intimation of sorrow and death she had received had left it doubtful to her what had befallen.

As Daisy looked down upon the child the child looked up at Daisy. Before Daisy knew what she was about, before she understood any thing with her understanding, though with her heart she knew it all, the little forlorn child was in her arms; she, on the ground, on her knees, was pressing it to her bosom, covering it with kisses, bathing it with tears, tears of a most thankful joy! One would have said this woman's heart had long been hungry for this child!

It was all ended. The struggle was over. That child was now lord and master of its mother's life: she was conscious, in some vague sort, that what her arms held was now her world. Daisy was there, on the ground, a long time; coming, only by degrees, out of the sort of trance into which she had at first fallen to a sense of there being something beyond and outside this moonlit and tented field in which she lay with her child. The little one, feeling itself cradled softly, warmly, lovingly, had fallen asleep again.

Consciousness of the price to be paid for her child dawned upon her. That life, as Kenneth Stewart's wife, which had seemed to her so happy, she had been tempted to think that conscience could not trouble it, regret touch it, or sorrow reach it, would be, forever impossible. But all that might have been seemed far off and long ago, while the child which was in her arms was her present. Had it, at this moment, been possible that she should have had the choice between Kenneth Stewart and the child, there would have been no hesitation, but, for all answer, a closer, more passionately clinging clasp of the child. There might afterward have come times in which she would have thought it hard that, for this child's sake, a child who was not

the child of love, she should have, all her life, to live loverless, husbandless, and friendless—a widow loathing to remember that she had been a wife, a mother dreading to see the father of the child live again in her boy; but there was no room in her heart for such thoughts now.

"My son, my little son, my own darling little son!" was said with a very ecstasy of joyful possession. Poor foolish Daisy! With one faithful friend lying dead close at hand, her only other friend divided from her forever (as she believed) by what she held in her arms. What she held in her arms, nevertheless, for that time, made her happy! she could have believed, for that time, that all the intolerable ache of longing and loneliness that had filled the few last months of her life (while she had been believing in love between Mr. Stewart and Myrrha) had been caused by the want of her child. By-and-by it seemed to Daisy that a shadow passed between her and the moonlight—looking up she saw no one. But she was roused to the remembrance that it was late in the night, and that her child ought to be in his little bed. She who, just now, had hardly been able to move her unburdened limbs, got up and walked bravely to the house, carrying the child. The door stood open, Daisy went in. An old woman sat crying over the kitchen-fire. She showed no surprise on seeing Daisy.

"She said you'd be here by night. And so you've found the child!" she sobbed. "Poor, pretty, precious, forgotten lamb!"

She held her arms out to take the little one from Daisy. Daisy still retained him jealously.

"Which room is ready for me? The one I used to have? I'll put him to bed there," she said. For the first time she undressed her own child. He wakened, and seeing a strange face bending over him, cried, but she soon soothed him to sleep again. Then she went and stood by her dead friend.

"I hope you know"—Daisy whispered softly close in her ear—"I hope you know that it is as you prayed it might be—that the mother's heart is wakened in me, and that I will live for my child. I hope you know."

And then it seemed to Daisy, from whose eyes tears were freely streaming, as if the dear lips smiled. Daisy did not see any one but the old woman that night. Her friend's husband was sleeping the first heavy slumber of profound mental and physical exhaustion. Daisy, having drunk some broth old Keziah brought her, saying, "It's good, I knows, I made it for her," pointing to the room where the dead woman lay, threw herself, dressed as she was, on the bed, beside her child, with no expectation of sleep, no wish for it. But she did sleep till morning, and woke to find yesterday no dream. She kept still, for the little one still slept: she gazed at it worshipfully. This morning she began to think of Kenneth Stewart, and though he and his love for her still seemed to stand afar off, to be long ago, she wept for him. If her way had been made simple and straight, her life enriched with a priceless gift, what sorrow was piled up in his! He had held her always in a sort of shrine, and now what would he have to learn to think her? Toward him her conduct had been so cruelly deceitful, so miserably selfish and cowardly: she had never known it so plainly as now. She wept for him very bitterly, and, in simple language, prayed for him—that "he might not mind so very much."

The day to which Daisy had wakened was Sunday. Within the house the presence of death caused an unearthly-seeming stillness, and outside the house was the heavenly quiet of a stainless, stirless autumn morning. In such country as that about Moor-Edge, still, sunny, autumn weather has a profound and peculiar charm. Its calm seems to flow from billow to billow along the uplands, and to fill up the measure of the valleys, and to have at once a breadth, a substance, and a spirituality unknown at lower levels.

Daisy, opening her window early, and looking out, over a tract of shining moorland, down upon plains and valleys, felt both awed and soothed by the silent, soft radiance of the world. But by-and by the little one woke hungry, and Daisy made haste to take it down-stairs. Early as it was, breakfast was set ready for her and the child in the little sitting-room she used to call hers when she stayed at Moor-Edge.

Daisy's first most important care in the world was to feed the little one with its bread and milk, her greatest delight to find that he would take his food from her hand uncomplainingly, though seriously and sadly, and with eyes that sought about wistfully for the familiar face.

"Poor master's up and out," Keziah told her. "The funeral's to be after to-morrow. I most fear it'll be the death of him to see her taken away. Ah, but she was a good woman, if ever there was one." A pause, and the old woman's apron was passed across her face. "The child's taken to you wonderful," she then went on. "It's not a child like just any other child, as you'll find; it has strange ways with it. She didn't use to think it would live. Look to it now, ma'am; wouldn't you think it know'd each word we're saying, and more, and could talk most sensible-like if it chose, but it's never spoken, not one word."

As Daisy looked, the child returned her gaze with a searching earnestness; then the mouth and chin quivered, the eyes filled, and the face was suddenly turned and hidden in Daisy's bosom, seeking shelter with the cause of fear.

"You know he's my own child?" Daisy asked, jealously. "I'm a widow, and he's my own child. I was mad when I said I wouldn't own him. My own child, my own darling!"

"The mistress told me—when she knew she was dying she told me—I was to do about every thing as you bid me; but she said she was sure you'd own the child, that you wouldn't leave him motherless."

"I'm a widow, and he's my son—all the world may know it," said Daisy, proudly. "He's my own, own, own beautiful boy!" she added to herself and to the child.

All the morning Daisy sat in the great cornfield with her child on her knees, or strolled about it, carrying him in her arms. After dinner she took him out again. All thought spared from him was given to Kenneth Stewart; but, indeed, so foolishly was she engrossed by this new and wonderful toy, that the day was almost done before she knew. It was no use to write to-day, there was no post; to-night, while her child slept, she would write, she thought.

The day was declining in the same perfect calm, the same serene radiance, with which the morning had dawned. Just now and then the bell of a distant hill-side chapel dropped out a note; now and then the child made some little inarticulate noise; now and then came some Sunday sound from the farm-yard. Would all her life, foolish Daisy wondered, be as peaceful and as satisfied, now she had given herself to her child, as this day had been?

"And will my darling love me always, always love me?" she bowed her face over the child and asked.

Between them and the sunlight a shadow crossed, as between them and last night's moonlight a shadow had crossed. Half in play and half by accident the boy's hand had entangled itself in Daisy's drooping hair. When she had freed herself and looked up, no one was in sight. Yet this time the falling of that shadow made her shiver. Daisy fancied the evening was turning cold; she made haste to carry the child in-doors. With long, lingering kisses on his face, his neck, his hair, his pretty hands, she trusted him for a time to the care of the old woman, who sat in sad Sunday leisure crying by the kitchen fire.

Yet once more Daisy wandered out. Within walls there seemed no room to think. A new idea had taken hold of her, that she ought to go to Mr. Stewart, to speak, not to write, what she had to say. Daisy blushed at herself at last, remembering what foolish fond thoughts about her child had filled much of a day during which Kenneth, who loved her so, must have been suffering such keen anxiety. She had been planning to get for her child all manner of beautiful clothes—first, such pretty thick-white embroidered frocks; then, little suits of "real velvet," with tiny buttons of "real gold"—had been indulging in such dreams, as a child might dream about her favorite doll, while Kenneth—

"Oh, what a fool I am! what a selfish fool!" Daisy cried, with burning cheeks. "A coward, too! I shrink from seeing his pain, but he won't suffer more because I see him suffer. I think, indeed, he will suffer less from spoken than from written words. I will go to him. But can I? Who, now she is gone, will take care of my child, all the long hours I shall need to be away?"

A tall shadow of some one coming toward her round the shoulder of the field touched her feet. A few seconds after, she and Mr. Stewart stood face to face. Daisy flushed, and paled, and flushed again.

"You have found me, then?"

"Yes, I have found you."

"You startled me very much. I was just thinking of you. I was just resolving to go back to you, to tell you something that I thought you would rather hear than read. To tell you something, and—" this

added with a faltering voice, "to ask you to forgive me, and to bid you good-by."

"I don't think there is much you need to tell me, Daisy. I was here last night before you. I saw you last night in the moonlight; I saw you this afternoon in the sunshine. I don't think there is much you need to tell me, Daisy."

"You saw me with my son, then," said Daisy, with a sort of despairing pride. "Then there is no need to tell I am a mother, and have been a wife; but how I was trapped into being Graham's wife, and how I thought I should always loathe and hate the child that was his child, and yet that now I love it, love it, love it— Only I can tell you these things, Kenneth."

"Why were they not told sooner, Daisy? What had I done that you could not trust me?"

There was something in the simple-seeming words, or in the tone and look with which he spoke them, that brought her, before he could hinder, to the ground at his feet.

"Have pity! Don't speak to me like that! Don't look at me like that, as if I had broken your heart!"

He lifted her from the ground, and placed her once more on the sheaves where she had been sitting with the child. A moment she gazed up at him; then she covered her face, and burst into a passion of tears. His face worked convulsively as he watched her. When she seemed pretty well, for the time, to have exhausted her power of weeping, he said, very gently:

"And so, Daisy, you never loved me?"

That roused her.

"I always loved you—even before I ever thought you loved me, I loved you!"

"That I cannot understand."

"You are not a woman and a coward! You don't understand how, even to myself, I tried to pretend that what was so loathsome in the past had not been. And could I speak of it? And to you?"

"It seems you could not, so I say no more."

"Have pity! Don't speak so, don't look so, don't mind so much! I was never worth your having, Kenneth. You know it now. And, now that I am not any longer alone, now that I have come to love my little child, you'll try to forget me, Kenneth—promise you'll try to forget me."

"For yourself, then, Daisy, you now feel the child enough?"

For answer she suddenly dropped her face into her hands. Already, having again seen Kenneth's face, and heard his voice, she knew that the child was not enough. There was a silence of some length. The pale autumn sun had softly faded from out the sky, from off the earth. The mists lay lake-like in the valleys. Out of a profound quiet, and sounding as if from far away, came Kenneth's voice, asking:

"And what life, Daisy, do you now propose to yourself?"

"Just to go away somewhere with my child. Just to live always for my child."

The words, even to herself, had an inexpressibly-dreary ring in them, though they were spoken in a soft and tender voice.

"And you think you are fit for that, poor Daisy?" No answer. "And, though the child may be enough for you, are you enough for the child?"

"God helping me, I hope to be so," she said, very humbly.

"Daisy," and there was a choking in his voice, "I can't bear it. Get up, dear, and come with me. Come in-doors, to some place where we can talk quietly. There is much to be spoken between us, and the evening is chill."

He held his hands to her and lifted her up. They passed together into the house, and into the little parlor. A bright wood-fire burned cheerily, and the tea was set ready. Daisy wondered where the child was; but she tried to put him out of her thoughts, and to fix her whole attention upon Mr. Stewart, and what he had to say. For all else there would be time afterward, when she had parted from Kenneth forever. It was already just so dusk in-doors that she could not see the expression of Mr. Stewart's face, which was turned from the light. And for so long he did not speak! She bore this silence while she could; then, when she could no longer bear it, with the words, "Kenneth, Kenneth, can't you forgive me? can't you?" she slipped to the ground, a second time, at his feet; this time she wound her arms about them, and laid her face upon them. She was soon caught up and replaced upon the little sofa.

"Forgive me, if I seem cold and hard," he said. "All this is a great shock to me, Daisy, a great shock. For the time I seem to have lost both you and myself." And then, forgetting he had already put this question, he asked, "And what is it, Daisy, that you now propose to do?"

"To go away somewhere—to some place where nobody knows me—with my child."

"That is much easier said than done, Daisy. And, Daisy, it is not the right thing to do. You don't wish to throw suspicion on your son's birth? to injure his prospects in life, if he should live, and grow to manhood?"

"What is it you mean, Kenneth?" she questioned, with anxious humility.

"I mean that, by living under false colors, as you have, and by keeping your marriage a secret, as you have, an amount of harm both to yourself and to your child, that it will be difficult to undo, has been done. You don't understand to what you would expose yourself, and the injury you would be doing your child, if you persevered in an at all similar course of conduct."

Daisy pondered, with the hot color coming and going on her cheek.

"If he lives and grows up, you would wish him to be a gentleman among gentlemen, to take the position his birth entitles him to?"

Daisy shuddered, but answered:

"Of course, I would not wish to injure my own child. What must I do, Kenneth? You will advise me. You know, only too well, how foolish I am."

"Too foolish to take care even of yourself, Daisy; and yet you would undertake the sole charge of a child who may grow to be a man."

Daisy's attention wandered from the subject in hand.

"Why, Kenneth, do you speak so doubtfully about my child's living and growing up?"

"Isn't a child's living and growing up always a matter for doubt?"

A moment's pause; then Daisy answered what he had said before.

"There are many foolish mothers, Kenneth, whose children take no harm. I suppose God helps them! Don't tell me I must not have my child. I am not wise and good, I know, but I love it, and it has no one else."

"Having to choose between us, you choose the child. You say you loved me, and yet, after a few kisses given to this child, after a few hours during which it has been in your arms, having to choose between us, you choose the child."

"Kenneth, don't torture me. You know there is no choice. Don't tear my life in two, trying to make me believe there is a choice."

"Your heart still clings to me a little, then, Daisy."

"For the first time since I've known you, you're cruel! and it's a cruel time to be cruel. Even if my child did not need me, what could I now be to you? But my child does need me. I choose my child. I must go away with it. I will hide myself with it."

"There must be no hiding, Daisy. Every thing must be open and in the face of day. I've told you why this must be. You must take your husband's name at once, for the sake of your husband's son."

"To call him that—my husband's son!—is as if you tried to make me hate him," Daisy said, passionately.

"You know I would not wish to do that. I have seen him, pretty, harmless little fellow. Your choice is made to keep him, and mine is made to take you and him into my keeping. I won't pretend it was made without a struggle. But once made, it is made."

Daisy paused before she spoke. "That can never be," she then said, firmly. "You used to call me your flower, but I have been trampled into the mud, crushed into it! I will not be picked up and worn upon your breast."

"Yes, Daisy, you will. I will tell you why you will. All is different from what I had dreamt and hoped. For the present all the joy is gone out of life. Angry with you, poor child, I am not. How can I be? But all is changed. Nevertheless, more than ever you needed me, you now need me. You are entirely unable to bear the brunt and the burden of life with your child. I am entirely unable, because you are still so dear to me, to leave you to do so. You must be my wife, Daisy, sheltered under my name. You will not refuse me, because only so can I have any case or rest."

"No, Kenneth, no: don't set your will on this. It is not fit. I

am so utterly unfit. I could go so far away that our paths need never cross, and in time, thinking of me as happy with my boy, you would be able to forget me. I could go abroad. I would take his name if you think I ought. Why should I not be safe, living as a widow with my son?"

"Daisy, don't waste your strength and mine. Believe me, I know best what is best for both of us, for all three of us. Since you are not to be parted from your child, I take the child with you. It has a look of you in its face, Daisy, and of your Wattie. I won't be unkind to it."

"What folly to tell me that," she said, laughing and crying "You unkind to a child—to any thing?"

"To *this* child I could find it in my heart to be murderously unkind, but for that look of you and of Wattie," he said, passionately.

"I can't help feeling that one day you will repent, Kenneth. I can't help fearing I am wrong if—I shall be wrong if I yield."

"Leave off feeling and believing for the present," he said, "and just rest here," opening his arms to her, "and tell me all about it. I must know; there shall be no dark corners any more. If you can bear to tell me now, I would like to be told at once."

He sat by her, and put his arm round her, rather in support than in tenderness. Perhaps if she had known half of what was in his mind she would never have yielded. Yet the result of it all was just this—just what he had told her—that he felt his protection indispensable to her, and that he still loved her so truly and deeply that there could be for him no ease of heart or life unless he had her in his care. That was the result of it all; but he knew that for this he would pay a price. Though Daisy was blameless, no doubt, of all but the weak folly of concealment, that weak folly would prove to have drawn upon her fair name such a cloud of suspicious-seeming mystery, as it would be intensely painful to any man should rest upon the antecedents of his wife. He sat beside her in the fire-lighted dusk, half hiding his face with one hand, and listened to her story. What the story was we know; what it was to him to hear and to her to tell him, it is not easy to know. Once or twice she faltered, almost failed in power to speak.

"Must I go on?" she asked.

"If you can you had better, Daisy; it will be well to have it told and over."

"Yes," she answered meekly, and then soon continued. When she came to the finding Wattie lying drowned on the river-side grass, to the vow she had vowed kneeling by him, she broke into passionate weeping. "Kenneth, Kenneth, help me to forget it all!"

He strained her to him then with soothing words. "Courage, it will soon be over, and then, indeed, poor Daisy, I will help you to forget it all."

Nearer the end, when she had to speak of her husband's treatment of her, a literal holding her in hell, as it seemed to both of them, it was Mr. Stewart who, for a moment, interrupted her story, starting up with some inarticulate exclamation.

She pleaded then, "Let me spare you and myself, let me leave the rest untold."

"No, Daisy. All you can bear to tell I wish to hear. I am not a woman to stop my ears from hearing. It is not the horror of the thing itself, it is the horror of your having suffered it. Don't you understand?"

"Oh yes—I know. But, Kenneth, can you believe what I tell you? I, as I tell it, don't believe it. Surely his badness was madness. It doesn't seem to me possible that the same world that holds you can have held him. And oh, Kenneth, indeed, indeed, it is not possible that I, who was his, should be yours."

"You were not his," he said, almost roughly.

"My soul was not, my will was not; but only if I could be passed through fire, and so purified, could I bear that you should take me."

She came at last to the very end. The report of the pistol, the feeling something on her hands and face, the looking at something, not knowing what she saw—and then—not supported now by the fever-strength that the first time she told the story had borne her through—indeed, it had been told in a changed and softened spirit, nurse's words, "It may be God's will you should remember and forgive," occurred to her; there was half excuse in the way in which she had said, "Surely his badness was madness"—she sank against Kenneth in a deadly swoon.

"I have tried her too much!" Mr. Stewart said, remorsefully, as

he laid her on the couch. "Heaven help us both!" he added, as he looked down on her death-like face, and almost thought it might be better for them both if she never woke.

Her first words when she came to herself were: "And now, Kenneth, you know that I am right; that it is not possible that you should take me for your wife."

"A pearl is always a pearl, however foul the mud in which for a time it may have been lost," was his only answer, then. He would not let her talk. He called old Keziah to come and wait upon her and he left her. He himself walked over miles and miles of moorland. "To the edge of the world and back again," he told Daisy, whom he saw again that night for a few moments, before he went to the little inn at which he was staying. "And I'm come back unchanged, Daisy," he added.

And the ending of this story was according to his will. Not exactly "a happy ending," but yet an "ending" that held the possible beginning of happier things. All the days of her life, both stormy days and sunny days, Daisy loved her husband as perfectly as it was in her to do any thing. For a long time Daisy's child was thought to be dumb. It had a dumb look in its gentle face, a pathetic, struggling look. But, at last, it learned to talk, not till it was five years old, just enough to prove that it was not, mentally, like other children. Rough and careless tongues named it an idiot; but it was not that. Then it died. Unfit to lead any thing but a child's life, requiring to be always cared for as a child, when with its childhood its life ended, even the mother, in her first bitter grief, and conscious that a vacant place was left which nothing could ever fill, felt: "It is well. It would have been so terrible to die, and leave him without a mother."

And Myrrha?

Myrrha was Aunt Daisy's bridesmaid. Myrrha was triumphant. "I told you so, Mr. Stewart! I told you Aunt Daisy was, I believed, already married!" Myrrha lived with "Aunt and Uncle Stewart" till she herself married. Perhaps Myrrha lost some of her "wisdom" at Redcombe. When she married it was only a fair match, not a splendid one, and she was "in love."

Myrrha was disappointed in herself, rather ashamed of herself. Aunt Daisy did what she could to console her, and Myrrha was open to consolation that came to her in the shape of a liberal and fashionable outfit, and all kinds of beautiful and costly presents. Myrrha's husband had the prettiest and most stylish woman in the neighborhood for his wife. That "they got on very well together," was the history they gave of their married happiness.

THE END.

A BALLERINA.

FROM THE GERMAN OF ELISE POLKO.

IT was a summer evening of the year 1735. Through the open doors of the little balcony came a sound of gay talk and laughter from the luxurious saloon of the charming Parisian *danseuse*, Camille Petitpas. The sweet fragrance of roses pervaded, like an enlivening breath, the brilliantly-illuminated apartment, where, on satin-covered chairs and tabourets, sat the loveliest women of the capital, surrounded by their elegant and distinguished admirers.

Who could have recognized, in the richly-dressed mistress of the saloon, the little daughter of the locksmith of the Rue Montmartre, who eight years ago skipped, singing and laughing, about the obscure house of her father, or, with frock tucked up, and her pretty feet neatly encased in a pair of red-leather shoes, delighted master and men with her merry, original dances, while Jacques, the youngest of the workmen, made quaint music with two great keys and a jew's-harp! The heavy braids of her golden hair, loosened in the dance, fell like a mantle about her form; her saucy face glowed, her black eyes flashed, and the severest gravity could scarce resist the charm of her laughing mouth.

The grimy workmen gazed at her in wondering rapture. Their stout hands rested—even supper was awhile forgotten—no higher tribute could have been rendered.

The street-door was, by chance, left open one evening, and the ballet-master of the royal theatre, passing by, looked in upon the living picture—a circle of Cyclops, and the little one in the midst, dancing upon the shop-floor by the light of a single work-lamp and the

glare of the smith's fire. The unseen observer rubbed his hands with delight, that his good genius had led him there at the fortunate moment. Only a few days before the famous Mademoiselle Salle had suddenly gone with an English duke to his native country; the other dancers had grown faded and old in the storm of Paris life; the almost ærial frailty of Anne Camargo, his most promising pupil, gave him serious apprehension. But here bloomed before his ravished eyes as fresh a rose-bud as ever unfolded into perfect flower—a being of strength and vitality, sufficient, it seemed, to resist a simoom of the desert. He must have her, cost what it might!

On the very next day negotiations were begun. Camille had no mother, and aunts and cousins vied with each other in convincing the locksmith that a fortunate star had risen upon the house. The little girl herself was radiant with joy at the prospect of dancing all her life, admired by a larger and more distinguished circle than her father's workmen, and plying her little feet to music more intoxicating than that of poor Jacques's jew's-harp.

Jacques opposed the ballet-master's plans with strange violence, and seemed almost beside himself at the thought of Camille's becoming a dancer. His entreaties almost induced her to retract her consent. How handsome he looked as he caught her hands, with angry tears in his eyes, and, stamping his feet, adjured her to remain with her father!

"Listen, Camille," he cried; "I swear to you that I will do something great in the world, and then I will come and marry you, and you shall be a good, happy woman; you may dance for me every day if you will, only don't go among those wicked old monkeys and wanton girls who dance for all the world! Nobody else will love you as I do—only believe that! I will work and buy beautiful dresses for you, and gay ribbons, and the prettiest red shoes in the world!"

And, as he bent toward her with these words, and, half-shyly, half-boldly, encircling with his arm her slender waist, drew her to him and kissed her hair, she had already opened her lips to say, "Jacques, I will stay at home with my father," when just then she heard the voice of the ballet-master at the door, and burst hastily from his arms.

Jacques turned away, his eyes flashing with anger.

An hour later all was arranged, and on the same evening Camille Petitpas left her father's house for that of her teacher. In the twilight she met Jacques once more in the passage before the door of her room.

"Good-by, Jacques," she said, in a faltering voice, holding out her hand; "I cannot help it; I must go. But, of course, you will come to see me often, and then, Jacques—do you not see?—we can marry just the same when you have become a great man, and I—a great dancer. I hope you will not forget to love me."

"I will neither love you nor marry you!" he broke in, hastily. "Go; you deserve to be forgotten! You will never see me again!"

And throwing off her hand, he gained the staircase at a single stride.

The same evening he disappeared from the workshop, and the men said to each other, "That proud Jacques has gone with the soldiers."

Camille was heartily grieved at the loss of her young friend, but she had little time to spare for regrets; there was so much to learn and to do. The locksmith's daughter was soon the darling of the ballet-master. Her beauty developed every day more brilliantly; she mastered all her lessons with wonderful quickness, and took the most difficult steps, as if for pastime. But in the society of her gay fellow-pupils she did not forget her father, and often coaxed for herself leave to spend a few hours with him. Yet she danced no more, in tucked-up frock and red shoes, by the light of the smith's fire.

A little thoughtful and grave she would sit there. Where could he have gone—that naughty, wild Jacques? If she could but feel his lips on her hair!

On her eighteenth birthday she first appeared in a solo *pas* as a nymph of the Seine, and her triumph and her rosy beauty were the three-days' talk of Paris. Even the king remarked her, and cast an approving smile at his ballet-master. What a piece of good fortune! Père Petitpas sat quite confused and frightened in the back part of a box among a crowd of relatives. He saw his child whirl to and fro before his eyes in her airy costume, but she seemed strange to him, and he only nodded sorrowfully when one of the aunts whispered to him that Camille was the most enviable creature in the world. She

had danced far more beautifully, he thought, in the workshop at home. Even her face seemed less charming here. Then she was so like her dead mother; but all that had vanished! And whither?

From that evening the old man saw his daughter less and less often in his workshop.

Engaged as *prima ballerina*, she now had an establishment of her own. Again and again she invited her father with the tenderest urgency, but the locksmith visited her only once—never again.

"My rough fists are not fit for your pretty things," he said. "Come to me if you want to see me."

And, indeed, she did come sometimes; but a Parisian *prima ballerina* had few leisure hours and many admirers, and the Petitpas was still fresh and artless, and loved to listen to the praises of her black eyes, and rosy lips, and pearly teeth, her dimples, and her little feet. It seemed a strange caprice that her shoes, though fashioned of the daintiest satin, were always bright red. All Paris knew and admired the "little red foot," and some noble ladies already began to wear shoes *à la Petitpas*.

The famous ballerina led a life of joy and gayety, and, but for a cloudy remembrance of the lost Jacques which flitted now and then across her sky, she could hardly have believed in the existence of shadows.

But one evening, just at the close of the ballet, as she ended her dance amid the applauding shouts of the multitude, and, in her gauzy dress and floating, rose-wreathed hair, stepped behind the side-scenes, a boy pressed through the clustering throng of her admirers, and whispered to the beautiful danseuse:

"Come home, Camille Petitpas. Your father is dying!"

Camille forgot her waiting carriage—forgot all but the one fact that her father was dying.

Deathly pale, regardless of all anxious calls and questionings, she threw a mantle over her light costume, and ran out along the street in her silken shoes so hurriedly that the messenger of evil tidings could scarcely follow her.

Breathless with haste, she entered her father's house. The workshop was lighted, for the master had ordered his bed to be removed to the familiar room. The sick man sat erect, surrounded by the dark forms of his workmen, his eyes and cheeks glowing with fever. He did not recognize his child, who, sobbing, seized his hand.

"Who is the strange woman?" he cried, as if in terror. "Call my child to me—my merry little girl in the red shoes—that she may dance my heart light, and I may hear once more her joyous laugh!"

Then the ballerina stole away into her own little chamber of the old time, and took from an old chest a simple little frock. With trembling fingers she braided her hair, and, twisting a scarf about her shoulders, ran quickly down-stairs.

"*Me voici, papa!*" she said.

And Camille herself took down the keys from the nail, and began to play, as once Jacques had done, but the tears ran down her cheeks, as she danced in her red shoes by the firelight. A smile of rapture overspread the face of the dying man.

"She looks like my poor wife once more," he murmured. "It is Camille, my happy child—and Jacques will come and take care of her."

He sank backward.

"I will sleep now," he said, softly. "Greet Jacques, and—kiss me!"

She kissed him, sobbing. He turned his face to the wall. It was very still in the workshop; no one dared to move; only the sparks of the smith's fire crackled and flew upward. Low and lower the ballerina bent over the motionless figure; a cry escaped her lips—her father was dead.

Years had passed since then. Camille Petitpas was still the darling of Paris, unrivalled, except by one—Anne Capuis de Camargo. But jealousy had no abiding-place in Camille's warm heart, and if, sometimes, she wept a tear or two, it was only to yield, next moment, to her friend's irresistible charm, and embrace her with the more passionate enthusiasm.

Sitting, one night, among her so-called friends, of whom all except Camargo secretly longed to eclipse and supplant her, Camille looked radiant and care-free, as if some good fairy had laid in her bosom the gift of immortal youth and beauty. No one of them all had so child-like a laugh as she. She could not wear her costly robes with the Camargo's royal air, and many of her vivacious gestures and expres-

sions recalled the locksmith's little daughter, dancing in the workshop in her red-leather shoes; but this only added piquancy to her charms.

Just now she sat in a somewhat careless attitude, beating time with her ravishing feet upon the back of her little lapdog. Her pretty head was thrown back; a leaf or two had fallen from the fresh rose at her left ear, and the string of pearls in her hair touched her rounded shoulder. A kitten, wearing a golden necklace, played with a faded bouquet, which lay upon the train of her costly, silk-embroidered robe.

The new duke Felix de Balbe-Berton, and the philosopher Etienne Cordillac, had taken their places beside the hostess, and upon the tabouret before her sat handsome Captain Jacques, just breveted for his gallantry in the war against Bavaria, at the side of young Louis François Conti, and under the command of the Marshal de Belle-Isle.

Who but the ballerina would ever have recognized in this stately hero, whose brave face and burning eyes took captive every woman's heart, the young journeyman smith who had vanished so tracklessly when Camille Petitpas went to the ballet-master's house? He had, indeed, "gone with the soldiers," and had made himself known to his foster-brother, the Prince de Conti. Returned to Paris, he hastened to call upon the renowned ballerina, who received him with loud exclamations of delight. Yet, with all her joy, she had little wish to become his wife. Jacques might, indeed, be the darling of the young prince; but—he was always poor, very poor, and Camille liked satin garments and Alençon laces, and a merry, careless life, and dreaded every serious attachment.

How different seemed the Camargo, sitting, a little way off, in her blue-silk costume! how strangely grave the type of her beauty! None could resist the charm of the features, modelled after the antique; the beaming, blue eyes, shadowed by long, black lashes; the delicate, ethereal form; the slow, pure grace of motion; the chaste, sweet lips. But, though men deified Anne Capuis de Camargo, they scarcely dared to love her; only women clung to her with passionate devotion. Voltaire was talking to her in his piquant, sparkling style, while Bouffet, the elegant young artist, clandestinely sketched the pure outline of her profile.

Thérèse Prevot, a ballerina who was growing old, strove, at least by her splendid toilet, to eclipse her younger rivals. What an *embarras de richesse*, of purple velvet embroidered with gold, of laces and feathers! What glances and what smiles showered upon the young marquis who sat beside her!

The brilliant Mademoiselle Salle gave free play to her incomparable hands and arms, while disdaining the attentions of a colonel, to give audience to a young actor.

Love, the favorite theme of all ages, engaged the attention of these various groups. Now sighing, now smiling—now louder, now more low—they confessed the secrets of the heart, and praised the fascinating power which sways all human souls. The cheeks of the ladies grew rosier, the eyes of the men more ardent. Deep, long glances played at hide-and-seek. Only Camille Petitpas avoided meeting the eyes of her truest admirer.

Turning, with a gay laugh, to the Duke de Berton, she exclaimed:

"I shall never believe in the strength of a man's love until he has shown me the proof of an all-subduing devotion. We women are expected to devote our whole lives to men who would not give up the pleasures of a single month for love of us!"

The liveliest discussion was provoked by this avowal; and on all sides arose a sportive word-contest, which, here and there, grew louder and more earnest. The gentlemen crowded about the ballerina, begging for a test—the imposition of some sacrifice. The old days of chivalry seemed to have been revived, when knights and troubadours declared themselves ready to contend with monsters for the ladies of their hearts.

"*Et bien!*" cried Camille, at last; "I will begin with the three nearest me—let my sisters follow my example! I demand only the knightly service of one month. Let each do for my sake what seems to him hardest; and, at the end of the appointed time, the company here assembled shall decide which has brought the most worthy offering of love."

"And then?" asked the young captain.

"Then? The reward of the bravest shall be left to me—I will then cease to be fickle."

"We devote ourselves to the trial!" cried the duke, the philosopher, and the soldier.

The ballerina extended to each of her three subjects her hand to be kissed, and supper was then announced in the elegant little dining-saloon.

Roses were strewn upon the brilliant table; sparkling wine bubbled in the tall crystal goblets; laugh and jest hovered on beautiful lips; only on the captain's face a shadow rested, until the chiding glance and whisper of his lovely neighbor dispelled the gloom.

"I hope you do not mean to starve yourself for my sake," she said. "I should weep all my life over a sacrifice so great. Do you not wish to win the prize, four weeks from to-day?"

"How could the wish avail?" he answered, with a melancholy smile. "I am the smallest and most insignificant in the hive of your adorers, and must content myself with the sight of their swarming."

During the following days and weeks, the dwelling of Petitpas, indeed, resembled a beehive. The story of the strange wager had flown through all Paris, and the curious flocked in and out of her doors incessantly, eager to be eye and ear witnesses of the wonderful deeds to be accomplished by these devoted three. New candidates announced their readiness to undertake a second contest after the decision of the pending wager—so tempting a prize seemed that strange, flighty something called Camille's heart!

There was little to see or hear.

The duke, whose parsimony was proverbial, made the most strenuous attempts to ruin himself by the purchase of various gifts for the queen of his thoughts; but, in point of fact, his usual careful providence never for a moment forsook him, and, despite what he considered his unheard-of expenditures, he remained as rich as before. His rueful countenance, when the haughty daughter of the locksmith pushed all his pretensions carelessly aside, was a source of extreme amusement to all who looked on. No one could accuse the Petitpas of selfishness; she accepted a fresh rose with the same grateful smile as a costly vase, and cared for a gold chain as little as a knot of ribbon.

The philosopher Etienne Cordillac appeared no more, since the eventful evening, in the presence of the ballerina. He had imposed upon himself the severe penance of exile from her magic circle. He was sure of the prize. Could there be more perfect self-abnegation than voluntarily to relinquish the presence of the beloved one? He saw her only at mass, where, leaning against a pillar, he looked over to her as a shipwrecked mariner toward the distant shore. He followed her from the church, scarcely less faithfully than the lackey who carried her missal; and when, arrived at her house-door, with pretty coquetry she drew aside her silken veil a little, she always met his large, earnest eyes, and saw his bow of humble recognition. The daily-multiplying throng of Camille's admirers already awarded to Cordillac the palm of tender devotion, and with envious imagination saw him quit the field a conqueror.

The captain, to the astonishment of all, had for the second time in his life disappeared without trace. Nobody had seen him—nobody knew where he was staying. At first, Camille scarcely missed him, amid the throng that gathered about her; but by degrees she began to speculate seriously upon his absence, and to grow restless and unlike herself. Secretly distressed, she sent her servant here and there, for some clew of the vanished friend of her youth. This strange, old man had entered her service but a short time before, but his bronzed and wrinkled face inspired her fullest confidence, as he stood at the door bowing low, while she spoke to him, and humbly retreating a step or two, as she advanced. Old François was the only witness of her daily-increasing anxiety for Jacques. He had heard often enough of the feats of her errant knight—surely, she might trust him with the most delicate and hazardous commissions! Perhaps, Jacques had gone to Africa, to tame lions for his lady—perhaps he was seeking to bring the teeth of some giant as an ornament for the fairest of necks! Perhaps he had become a monk, and thus thrown his life at her little feet—and she had lost him forever! Camille had more sad thoughts in that one month than in all her life before—she was frightened at herself. She execrated her foolish wager, that hair-brained Jacques, and finally herself; and at François's quiet entrance she often looked up from her lace-work with eyes hot and swollen from weeping. Fortunately, such grief was not uninterrupted. The young Marquis Erequis was such a piquant jester, and the Chevalier Labord related to her so many *petites histoires scandaleuses*—Voltaire's sar-

casms were so brilliant, and Boufflet's sketches so charming—she was forced to forget her trouble awhile. Then came the excitements of the stage-dance, and the triumph behind the scenes, where François waited with endless patience, before he was allowed to cover, with her little blue mantle, the full shoulders of the ballerina, only to be pushed aside and trod upon, as he strove to assist his mistress into her carriage. Many a cavalier would have sworn that he had received, at such a moment, a smart cuff or a stout kick, from the old servant; but no! he must have been deceived—one glance at the bent form and withered visage plainly showed the impossibility of such violence. Indeed, so infirm was he that, in lighting visitors down the staircase, it often happened that he tottered against the wall, under the weight of the chandelier, not without jostling somewhat rudely the guests nearest him. The lights were extinguished, and in the dark and troublesome descent the unfortunate admirers of the lovely Petitpas tripped and stumbled, as if malicious spirits led astray their groping, uncertain feet. Before François could relight the lamps, they were already at the door.

Thus the days passed. Camille's eyes often had a sorrowful expression, and, for the first time in her life, her sleep was disturbed by frightful dreams. Starting up, sometimes, with a cry of terror, she would lean her arm upon the pillow, and weep like a frightened child.

At mass, she prayed longer and more fervently than ever before, and sometimes quite forgot to coquet with her admirers. Even the duke could not obtain a look from her.

Where was Jacques?

At last the day arrived, on which the curious throng pressed into the *salon*, for the decision of the far-famed trial of love. What a host of eager, charming faces! Even the beautiful, proud Camargo wore an air of unusual excitement. Camille herself, although in richest dress, was looking pale, and cast anxious glances toward the door, which François was incessantly opening, to admit fresh arrivals.

The philosopher, Etienne Cordillac, and the Duke de Balbe Berton appeared, each wearing a triumphant smile. Jacques was not there! The dial-hand marked the hour of ten—the decision must be spoken!

The duke stepped gravely forward, and placed a small book in the hand of the ballerina, whose disquiet increased every moment.

"You have only to glance over these pages, fairest of the fair," he said, "to see that I have almost ruined myself for your sake. Here are my receipts noted down—there the expenses of the last month. I am ready to complete the sacrifice for the prize of your heart!"

Petitpas laid aside the book, with a sad smile.

"And what have you done for me, Etienne Cordillac?" said her sweet voice

"I chose the hardest, voluntary exile! Who could do more for the queen of his thoughts?" cried the renowned philosopher.

"I!" replied a new voice, and François, the old servant, stood in the centre of the room. One moment, and the servant's dress fell upon the floor—the wig he removed with a low bow. In his uniform, his handsome face radiant with the ruddy glow of enthusiastic emotion, Jacques stood before his beloved and her brilliant circle.

"I think that I have accomplished the severest task," he said, sinking gracefully to his knee, and laying his wig at the feet of Petitpas. "I challenge all men to imagine a harder penance. Daily, hourly, to look upon the adored queen of my heart, without allowing myself to approach her, or receive one glance from her eyes—to do her a thousand little services, with the humble deportment of the most insignificant attendant—to lead to her with my own hands my most dangerous rivals, and to bring to her their letters glowing with love—could purgatory devise a sharper punishment?"

A cry of applause followed. The ladies were enchanted with the handsome lackey—the gentlemen crowded, laughing, to his side. Balbe and Cordillac acknowledged themselves outdone. And Camille? Smiling and blushing, she gave her white hand to her childhood-friend, then turned with bewitching grace to her vanquished adorers.

"If he is guilty of the slightest negligence in his service, I will send him away and employ another," she laughed, in exuberance of joy, with a tender glance at her beloved, "and who knows how soon I may be forced to do so, if—"

"Patience!" interrupted the philosopher, and the duke suppressed a sigh. But his face cleared again, as charming *Mademoiselle Salle* laid her little hand upon his arm, and whispered, teasingly:

"If I wanted a servant, there is nobody whom I would rather engage than you!"

They passed into the dining-saloon, Camille on the arm of her lover. The table glittered with costly furniture, and fresh flowers breathed perfume from the marble vases. Boufflet and Cordillac sat next to Anne Camargo; Voltaire, opposite her, by Mademoiselle Salle; the duke on the other side.

Suddenly, the beautiful Camargo leaned backward for a moment, and looking, with a smile, upon her neighbors, asked: "Shall we also lay a wager?"

"In a year—only not to-day!" cried Balbe, with comic energy. "I shall need as much time as that to scrape a *livrée* together!"

"And I shall need, I fear, more than one year to grow as handsome as the lackey of Petitpas!" said Voltaire.

Meanwhile, Camille's fingers were toying with a rose; softly they glided into the hand of her young friend.

"Are you not sorry that it is I who have vanquished you both?" asked the young officer, softly, seeking Camille's eyes. "Are you happy, Camille?"

"Oh, Jacques! happy as in that sweet time when I danced for you in the red shoes!"

Nobody ever heard of a change of servants in the house of the famous Petitpas; but all the ladies of Paris envied her so handsome, clever, and faithful an attendant.

A MUNICIPAL MOUTH AT DAYBREAK;

OR, otherwise, a Municipal Market at Daybreak, the only objection occurring in the unfitness of the respectable and honored word "market" to represent the place. There is associated with the term, probably through the popular medium of foreign illustrated papers, a strong impression upon the imagination, of high-storied, arched-roofed, iron, stone, and glass built triumphs of architecture and convenience, which is sadly outraged by the mean-looking markets of New York. He is a very reasonable man to whom it occurs that the building which shelters the transfer of Nature's gifts to man should be particularly appropriate in cleanliness, position, and even elegance, and who looks on all others with a protest at their insufficiency, and their ignorance of the dignity of their uses.

At the two extremities of Fulton Street, the city gulps its food in the most indecorous and unintelligible manner. It begins its breakfast at one in the morning, ends it at five, and is engaged until eight in swallowing it and fully disposing of it. It takes its meal with as much apparent respect for it as a man who goes to his table in his shirt-sleeves, with his boots off, his hat on, and who eats with his knife in his coal-cellar.

It is a terrible and indiscriminating bolting, and, as a mere monstrous action, is highly interesting to look upon. The lack of grace and convenience makes the matutinal hurry-skurry an eminently picturesque affair, and is invariably included in the sights by all New-Yorkers whose fate it is to entertain a foreign friend. Why this is so, Heaven only knows; unless, perhaps, the host, in his American rivalry of English misery, feels that he must throw in the markets along with Water Street, in order to hope to outdo St. Giles or Spital-fields.

In this light the gratis and voluntary exhibition of Fulton-Street deformities becomes mournfully bearable. To become fully aware of them yourself is quite a shock to your respect for the highly honorable city and all that it contains, and you write a highly-indignant letter to the press. But it is never printed until there occurs the semi-annual outbreak of journalistic bile in regard to this very matter, and your effectual putting of the case is prominently isolated and given to the municipality to ponder upon, with forty thousand other effectual puttings of the case, also prominently isolated as was yours.

Washington Market, like its rival at the other end of the street, begins in a shaky brick excrescence as a nucleus. Trundle yourself down to it at one or two o'clock on a clear morning, by way of a somnolent horse-car, and it strikes you as being an up-river village drowned out by a freshet, and shivered and soaked and racked to drift-wood, and which has stranded here in the mud with its solitary church, left intact by act of Providence. All the frame buildings of the settlement appear to have dissolved into mouldy walls and roofs of countless sizes and shapes, and to have been piled upon each other by some reckless power that had not the remotest sense of order in its work. Seen by the daylight it becomes a confused mass of gray-

ish shades marked with blackish stripes, existing in the ever-present interest of damp-rot, the whole closely resembling a huge bank of clayey marl. It has the condemning mark of glaring theatrical placards upon it, a multitude of tale-telling props about it, and a general staggering and infirm drunkenness all through its wretched area.

Seen at night it is startling. A brilliant moon makes vivid highlights upon some broken gutters, some disconnected and deviously-slanting roofs, upon the whitish unstable belfry with its pair of ancient steps leading downward, and plunges all the rest into a sudden inkiness. It is an unwholesome-looking place, appearing to be a spot condemned to die, and sink back to the earth, of a self-bred pestilence and impurity, and to be shut out forever from man as a plague-spot.

This mass of roofs covers the market proper; but, westwardly of it, there are squares of incoherently-arranged sheds running to the river-front, with muddy causeways between them, slippery with decaying fruit and redolent of spoiling vegetables. This is the place where the hardier and rinded fruits are mainly sold, and they lie piled in pyramids like the shot in an artillery-park. The market, taken in a mercantile sense and apart from the buildings, does not, however, confine itself to this limited though extensive quarter, but carries on a flourishing business in West, Washington, and Greenwich Streets, and north and south for a dozen or fifteen blocks. Fulton Street in its entire length from North to East Rivers is, at five in the morning, quite as much a bustling market as the very centre of the building itself.

At two or thereabouts the coming tide of wagons begins to set strongly in from all quarters, and the distant rumbling upon the pavements begins to grow deeper and quicker. They start out very suddenly from the gloom with their drooping horses and high canvas-covered loads, and plunge into some one of the many streets which make up the district, and in them take up the best position in the judgment of the driver, who instantly feeds his horses and goes to sleep upon his load. These market-wagons, coming from all parts of the outlying country, have a singular uniformity of shape and color, and even rival the jaunty milk-carts in gay appearance.

They curiously wedge themselves into impossible places at choice corners, and overlies each other after the manner of steamboats at a levee. It is highly pleasant to notice that the horses are almost invariably strong, wiry, and well cared for, and that a general neatness shows itself about the many teams.

The streets, after three o'clock, fill rapidly, and the temptation is very great to also add, noiselessly. Many men are groping shufflingly about, and there is a constant inroad of new arrivals, all bulky and plethorically swollen, and seeming, to a novice, to be very unmanageable, and still there is a strange silence upon all. Every thing seems to have been deeply narcotized or invisibly muffled. Teamsters' oaths and astonishing chaff are not to be heard even in the midst of the most complicated entanglements, a muttered growl or quiet gesticulation serving all purposes admirably. Wheels in some way avoid all noisy shocks, and the slow feet of the horses fail to give out any sharp rings upon the pavements, in consequence of the littering straw which covers the ground. Not a single cry is to be heard, and not a voice is violently raised, though within a stone's-throw hundreds of carts and teams are on the move. It reminds one strongly of some secret movement of an army corps, where all lights are quenched and all noises drowned, and where there is an underhand rendezvous for the purpose of some dreadful surprise upon the sleeping enemy.

All the overhanging door-ways and niches made in walls by closed shutters are rich in slumbering men. Spaces between barrels, made comfortable with potato-bags, hold unintelligible heaps of coarse, frowsy, dusty clothing, which upon an emergency are capable of developing themselves into mop-headed, bewildered countrymen, who stretch themselves, and in a flash are wide awake both in the matter of eyes and bargains.

Standing at a street-corner, you find the crossing thoroughfares crowded on both sides with thickly-packed rows of bulging carts, and of horses sleepily munching an early breakfast in the dark. Prostrate, angular forms, with their heads buried in their arms, are perched upon every available foot-board, and you stumble your way over them at every turn.

Opposite to the main entrance to the market proper, there is a long restaurant, which has kept its wide doors open all night, as it does every night, for the accommodation of the hungry and irregu-

lar crowd of market-people. It is very glaring with its flaming lights, and there are seats for seventy people at the different tables. Every thing is scrupulously neat, but the frequenters, at this early hour, are savagely uncouth and singular. They slouch in and sink into their seats with the bearing of men who are carrying heavy burdens on their shoulders, and even go so far as to incline their heads to one side, as if to give the imaginary weight a little more room. Their caps are small, close-fitting, and set well down over their ears. Their clothing is generally coarse blue, horribly soiled and dampened, and their boots have an appearance of always stamping recklessly in slaughtering. It takes no very sharp eye to detect a certain wolfishness of manner in their behavior, a strong inclination to perform all trifling actions with a double-handed blow, or a tearing pull. They are, however, very far from quarrelsome, and, on the contrary, are courteous and kind; but there is, nevertheless, a blood-thirsty look to their eyes, and a highly-uncomfortable appearance about their huge hands. An unquenchable odor of the market clings about them, and in their friendly manners toward each other they fling themselves into adjacent seats with a nameless carelessness, which reminds you startlingly of the trembling jelliness of sides of beef.

A quick-handed, white-aproned waiter, with a marvellous sprightliness (in view of the hour), leaps at the new-comer, with raised eyebrows, and ejaculates, seriously:

"Hoi?"

The butcher, without looking up from an imaginary quartering of a ghostly sheep, which he is carrying on with a table-knife, in company with two others beside him, instantly returns, with heartiness:

"You — hurry up!"

The result of this is a cup (and a thick cup, too) of milky coffee and three steaming-hot, heavy biscuits, evidently designed by some misanthropic, man-hating cook, with an eye to the final extermination

of the human race. These seem to be the only dishes offered at this time, as they, and they only, are partaken of by the country drivers, who, with their mortal antagonists, the market-men, throng the place. There is a cheerful clatter of dishes and jingle of pennies, which accords badly with the heavy-eyed crowd, which still seems to be under the narcotic influence before hinted at.

Six odd characters suddenly come in from the outer darkness in the shape of burly women, with dresses and sun-bonnets of nankeen. They solemnly distribute themselves at two tables and gaze stonily at

nothing. They are of that brass-mouthed corps of fruit-venders who arouse your neighborhood at unseasonable hours with cries descriptive of unseasonable wars, and who are so fearfully muscular and sun-burned. They are Germans, with the general appearance of Indians, and are proverbially keen at a bargain. They are waited upon with great awe and deference, and, with the independence which distinguishes their gait, dress, and general treatment of both dealers and customers, call for tea and five cakes each, which are promptly served, without a breath of protest.

Across the way, under the vast and unsightly covering before mentioned, there is at this time, and has been for two good hours, a monstrous bewildering bustle and activity in flourishing progress.

As you skirt the place, preparatory to your entrance, and tramp with uncertain steps through the ankle-deep muck and garbage, there are faint glimmers of light struggling from within, forcing themselves from the numerous cran-nies and imperfections in the walls, while oftentimes there suddenly bursts upon you a full glare from some little unhinged open door, which blinds you, and inclines you to the belief that the market is on fire, and ready to burst out into a consuming flame at any moment.

At the first glance the interior presents the idea of a disorderly, unintelligible mass of stuff. An inextricable interwoven net of rafters and uprights, with supports and braces without number, stretch out sideways, upward and downward and everywhere. There are numerous short flights of steps leading to floors above and below,

which also have their racks of hooks, their little partitions, their sentry-box counting-rooms, and their marble and wooden shelves. The floors are declivitous, slippery, and decaying. The walls are propped, patched, and altered out of all semblance of their former regularity and comeliness. There is also an ever-present, mouldy dampness, as if from a per-

petual drenching from the coils of hose, which hang in black festoons on every hand.

The narcotizing influence of the streets has also penetrated here in a particular spot, and has prostrated some ungainly, oily men into meat-troughs, and upon some whitish stone benches, used, at other times, for the flaying of huge fish, where they lie in contorted heaps with dishevelled dress, buried in heavy and swinish sleep.

Under a row of flaring gas-lights, blown hither and thither by irregular gusts, which burst in at every quarter, there are other men

WASHINGTON MARKET.—INTERIOR.

WASHINGTON MARKET.—OUTSIDE STREET SCENES.

with bare arms and feet, busily but silently engaged in rapidly trimming white-fleshed, slippery halibut. A salty odor permeates the air, and is a little refreshing after the stifling, oppressive atmosphere elsewhere encountered. You pass on in alternate gloom and glare, and at a single turn come upon a landscape of meat. Long, reddish-white vistas of sides open before you, with deep ravines of blushing fore-quarters. Terraces of haunches arise from forests of shin-bones, while groves and glades of livers spread out from a foreground of ribs. There is a thick, overhanging foliage of the heads of poultry, and a distant background of general fleshiness.

There is great activity here. There are many heavily-built men, such as were met at the restaurant, struggling under huge piles of beef, or engaged in fierce wrestlings with heavy bodies hard to hold and handle. They dexterously approach them, plunge upon them, strain and slip with many mutterings, and finally bear them off, avoiding all collisions with astonishing ingenuity.

It is in this locality that the true butcher blooms into complete flower. Seen at this hour, with all his faculties brightly awake, with a brace of sharp customers, and surrounded with the meaty objects of his pride and pleasure, you behold an emperor. True, he reigns in a contracted cell of flesh, and his myrmidons are but a couple of oily men, yet you are forced to believe in him on account of his complete ascendancy over them, and because of his consummate skill.

He is dressed in a flowing white frock, reaching to his boot-tops, and having a wide sailor-collar trimmed with blue, a tall silk hat, and a neat cravat. The time to properly contemplate him is when he has completed a good sale of several sides of beef, and is undertaking their trimming. He takes his steel and his knife with easy confidence, while his men bring the bulky mass of meat, and deposit it before him on a much-used but particularly tough and sturdy table. It is placed to a nicety; but the butcher scowls silently, and it is instantly readjusted. He then looks upon it critically, walks up to it, and prods it deftly, and turns away exactly as a cricketer does who has just blocked a dangerous one from Wright. He turns up his sleeves, and steps back again; he finds his men have turned the meat the other side up, and are watching him with breathless reverence. He is proud of the homage. He poises his blade airily, makes a kissing sound with his lips to demonstrate his ease of mind, and makes an off-hand incision and partially separates a waste portion; he then swears roundly, and a startled slave darts upon the severed piece and tremblingly holds it while the great man skillfully passes his knife along over many irregularities, and suddenly whips it outward with a flourish, and the refuse part falls to the floor. He straightens, draws his sleeve across his forehead to wipe away imagined perspiration, while his worshippers gaze at each other for some seconds in inexpressible admiration, after which they bear off the burden and fetch another.

The quantity of food which passes into this market on its way to the people is something very enormous, and a proper realization of its vastness is better obtained by the eye than by figures. This spot is the concentration of the results of a whole year's growth, of a season's killing, of the grand products of farms for fifty miles around, and the general summing up of incalculable labor. Its size and capacity is forced upon one by actual view of the masses of subsistence poured in here daily. After having passed through lanes of beef and lamb and pork, and come upon other almost interminable lanes of the same rich material, beyond which are still more lanes, with short alleys running off on either hand, and all filled with sharp, urbane, white-frosted sellers, and still sharper purchasers, with groups of soiled, slouching porters at their heels, you suddenly slip into the domain of vegetables, and from the numberless farmers' carts drawn up on the outside you behold an endless shower of garden-stuff, hurled inward at an army of boys who rapidly make symmetrical piles behind them. There appears to be even a greater value in this branch of marketing than in the meat interest, for there is a ceaseless horde of wagons bearing down upon the place from all quarters, and, seen from within, looking like smoky shadows being gradually drawn into a boundless vortex.

As the hours slip by, and the darkness begins insensibly and almost imperceptibly to pass away, the grand uproar within and without increases with every moment. Sundry hammocks, swung within some sheds, and ingeniously avoiding the piles of stock with which the places are closely stored, become gradually emptied of their sleepy, dishevelled occupants, and are folded up and put away for sake of

their room. Swarms of hungry-appearing men, with huge baskets, or bags fashioned from large aprons, together with crowds of jostling women who seem to have sprung from the ground, now begin to pour down and in from adjacent streets, and to thickly throng all the narrow passages. A loud murmur rises up from them, and they range along, gazing, touching, and haggling. It is a matter of serious business with all, and no holiday laughing or barter comes from them; but they steadily and earnestly step hastily in and out of the stalls, like dainty bees in a flower-garden, and all the time curiously playing at the game of "follow my leader." What one resolute person does with promptness, either stopping at this haunch or slurring over the next, or questioning respecting this tempting quarter or suspiciously feeling of that, a dozen others, blessed with less knowledge or aplomb, are sure to do in his (or perhaps her) wake; and so they string along in close and noisy procession, with money held tightly in their hands, and their keen eyes scanning all sides in search of bargains.

Without, too, the coming light pushes a noisy crowd in its van. The sidewalks, for many blocks, have their similar throngs of eager purchasers, while up and down there run currents and counter-currents of green-grocers' and petty-market wagons, purchasing and loading from the farmers' teams by the curb-stones.

It is a scene of sharp traffic on infinitesimal differences in prices and stocks. No financiers with their sixty-fourths per cent. are more rigid than these groups of neatly-dressed German women, with brown skins, eager faces, tightly-braided hair, and keen fingers and tongues, who pry and question over their marketing. And, again, there is not to be produced, from all the city's multifarious classes who live by their wits and the weaknesses of others, one which can long compete with these rasping, screwing rustics in quality of bargaining ability. Whether their eternal wrestling with the ground for its somewhat precarious and tardy products produces such a fine edge to their transactions, or whether it comes from morbid sensitiveness to the value and uses of the dollar, pondered upon in solitary labor in the fields, it does not clearly appear; but, whatever it is that gives them such a cunning refinement of keenness, it does its work marvellously well, and, perhaps most men might think, overshoots the mark just a trifle. As it is, however, it appears that in this diamond-cut-diamond contest much business and work is well done, for, by seven or eight in the morning, the burdens are mostly transferred from the sellers to the purchasers, and the hegira of depleted red wagons commences.

The flaring restaurant has long since turned off its gas, and has emerged from the contracted fare of two dishes into the full glory of "all the delicacies which the market and the season can afford." The crazy, tumble-down market itself seems to have come to the cheerful determination to stand up for one more day, though one might reasonably suppose that it would sooner shrink into the ocean of mud and decaying wood which encompasses it than to expose its hideousness to the morning light, conscious, as it must be, of so many deformities. But who knows but the tottering old collection of hutches still keeps its infirm legs for the purpose of preaching a sermon to some few certain bodies who should decently bury it? If this is the idea, well and good, and all respectful honor to it; but, if it still voluntarily stands in its character of Washington Market, the sooner it is dissolved into infinitesimal splinters and memories, the better for all concerned.

THE STRASBOURG LIBRARY.

THE Public or "Town" Library of Strasbourg, destroyed in the recent siege by the Germans, was located in what is known as the "Temple-Neuf," formerly a Dominican monastery; but of late, used as a place of worship for the Lutherans. Its history dates back as far as early in the sixteenth century, when it seems to have originated in a bequest from John Geiler von Kayserberg, a famous preacher, who lived in Strasbourg thirty-three years, and died there March 10, 1510.

His library of books and manuscripts, which he bequeathed to the town, doubtless formed the nucleus of the public library. The art of printing was then but half a century old, and Kayserberg's collection contained more manuscripts than printed books.

It was not, however, until 1531 that the library became known as the "Town Library," but from this date it grew by constant acquisition, until, in our day, having added to itself a large collegiate li-

brary, and two or three valuable private collections, it contained one hundred and eighty thousand volumes of printed books, and fifteen hundred and eighty-nine MSS.

Both in early printed books and ancient manuscripts it was eminently rich. Oberlin, once chief librarian, computed the number of its books printed before 1520 at four thousand three hundred; and of these, not less than eleven hundred were without date.

Among the collections presented to the library should be mentioned that of John Daniel Schoepflin, a learned historian and antiquary, professor of Eloquence and History in the University of Strasbourg, in 1720. Schoepflin wrote many local antiquarian works, and numerous small dissertations; one of which latter, was an attempt to prove that Gutenberg first practised the art of printing at Strasbourg which Schoeffer afterward perfected at Mayence.

The abundant book rarities of the Strasbourg Library were doubtless due to the fact of that city having certainly been the cradle of the art of printing, although Mayence may have been its nursery. But, besides rare books of great value, the library contained one of the finest collections of illuminated manuscripts. Of these, may be specially noted the "*Hortus Deliciarum*" of Herada, Abbess of Landsberg, one of the most perfect specimens of illumination as practised at the close of the eleventh century. The period of the production of this MS. is believed to have been about 1180. The subjects were miscellaneous, and most elaborately represented by illuminations and miniatures. Dibdin, the bibliomaniac, describes it as comprising "battles, sieges, men tumbling from ladders which reach to the sky—conflagrations, agriculture—devotion, penitence—revenge, murder—in short, there is hardly a passion animating the human breast, but what is represented here, it is so perfect in all its parts, and so rich in its particular description, that it may probably vie with any similar production in Europe."

Here, too, were deposited those memorable documents in the lawsuit between Gutenberg and his partner, which have thrown so much light on the origin of the history of printing. The depositions in this case were in MS., and contained in a small folio, dated 1439. Dibdin questions their authenticity, believing them to have been only attested copies; but he is hardly sustained by evidence.

Among the early printed books were copies from the press of Faust at Mayence, Eggesteyn of Strasbourg, and Mentelin of the same place. The latter, who was supposed to be the earliest printer of Strasbourg, was born there, of an obscure family, in 1410. He was originally a writer and illuminator of manuscripts, in the service of the Bishop of Strasbourg; but having got hold of the art of printing, he practised it about 1466-'72, printing his first works without date, and passing them off as manuscripts, which were then selling at a very high price. He printed the first German Bible about 1466; and was followed by Eggesteyn, who printed a Latin Bible in the following year.

There were likewise in this library a copy of Cicero, printed by Faust in 1465; a Latin Ptolemy of 1462, with fine engraved copper-plates; the Chronicle of Foerisius, printed in Gothic type in 1474; of which Dibdin acknowledges that he never heard of another copy; a copy of St. Jerome's Epistles, printed by Schoeffer in 1470; a Latin Bible printed by Jeusen in 1479; the first edition of Catullus and Propertius of 1472; an early edition of Virgil, and many others of equal rarity and antiquity.

Besides these specimens of early printing, the Strasbourg Library contained a finely-selected collection of modern books; yet it was only used by the public to the extent of an average daily attendance of fifty readers, of whom many were doubtless tourists and strangers.

WINTER RAIN.

THE rain, the desolate rain!
Ceaseless and solemn and chill;
How it drips on the misty pane!
How it drenches the darkened sill!
Oh, scene of sorrow and dearth,
I would that the wind, awaking
To a fierce and gusty mirth,
Might vary this dull refrain
Of the rain, the desolate rain;

For the heart of heaven seems breaking
In tears o'er the fallen earth;
And again, again, again,
We list to the sombre strain,
The long, low monotone
(Whose soul is a mystic moan),
Of the rain, the rain, the rain,
The low, despairing rain!

The rain, the mournful rain!
Weary, passionless, slow;
'Tis the rhythm of settled sorrow,
'Tis the sobbing of careless woe;
And all the tragic of life,
The pathos of long ago,
Comes back on the sad refrain,
Of the rain, the mournful rain,
The desolate, dreary rain,
Till the graves in my heart uncloze,
And the dead who are buried there
From a solemn and weird repose
Awake; but with eyeballs drear,
And voices that melt in pain,
On the tide of the plaintive rain
(The yearning, hopeless rain,
With its passionless, slow refrain),
Of the dim, funereal rain,
The long, low, whispering rain!

PAUL H. HAYNE.

THE NATURAL BRIDGE.

WITH ILLUSTRATIONS BY HARRY FENN.

II.

THE most striking view of the Natural Bridge is that from below, and no better hour could be selected than that fixed upon by Mr. Fenn. As the sun rises and flashes its splendors through the gigantic arch, the scene becomes one of extraordinary beauty and sublimity—beauty from the exquisite flush which spreads itself over rocky mass and stately fir, over pendant shrub, and the fringe of evergreen; and sublimity from the wellnigh overpowering sentiment which impresses the mind in presence of the mighty arch of rock, towering far above, and thrown as by the hand of some Titan of old days across the blue sky, appearing both above and beneath. It has been well said that no one who has witnessed this extraordinary spectacle has ever forgotten it. An English gentleman wrote: "Then there is the arch, distinct from every thing and above every thing! Massive as it is, it is light and beautiful by its height, and the fine trees on its summit seem now only like a garland of evergreens; and, elevated as it is, its apparent elevation is wonderfully increased by the narrowness of its piers, and by its outline being drawn on the blue sky. Oh, it is sublime! So strong and yet so elegant! Springing from earth and bathing itself in heaven! I sat and gazed in wonder and astonishment. I had quickly, too quickly, to leave the spot forever; but the music of those waters, the luxury of those shades, the form and color of those rocks, and that arch—that arch—rising over all, and seeming to offer a passage to the skies—oh! they will never leave me!"

With the brilliant drawing of Mr. Fenn before his eyes, the reader would only be wearied by any description of the exquisite scene which it represents. The grandeur and serene loveliness of the spectacle are sufficiently indicated—the gentle stream which passes with a murmur from its hiding-place in the bosom of the hills—the lengthening vistas, cool and soft, and bathed in dawn—the silent mountains—and, in the midst of all this exquisite beauty, the great soaring arch, with its jutting buttresses and fringes of the evergreen pine, the shaggy eyebrows of the giant. They dwindle these heavy-headed evergreens into little fringes only—even that picturesque monarch, rep-

PICTURESQUE AMERICA.—UNDER THE NATURAL BRIDGE.

PICTURESQUE AMERICA.—TOP OF NATURAL BRIDGE,

resented in the second drawing of Mr. Fenn, on the summit of the bridge, shows scarce so large as the spray of ferns and cedar held in the hand of a girl! There is excellent reason, indeed, why the loftiest forest-trees, proudly raising their heads to heaven, and affording a resting-place for the eagle, should thus shrink in dimensions. From the summit to the surface of the stream below is two hundred and fifteen feet; and thus the Natural Bridge is fifty-five feet higher than Niagara.

It remains only, before terminating our brief sketch of this celebrated curiosity, to speak of the hazardous attempts, made by more than one person, to climb the rocky sides of the great arch and reach the summit. This has never yet been done, but a considerable distance has been attained by venturesome climbers, who have recorded their prowess by cutting their names on the surface, at the highest point reached by them. High up among these may be found the name of no less a personage than George Washington, who, strong, adventurous, and fond of manly sports, was seized, like many others before and after him, with the ambition to ascend the precipice and inscribe his name upon the face of the rock.

The highest point ever reached by any one of these adventurous explorers is said to have been attained by Mr. James Piper, at the time a student of Washington College, and subsequently a State senator. It was about the year 1818, when, with some of his fellow-students, Mr. Piper visited the bridge, descended to the foot of the precipice, and determined to ascertain to what height it was possible for a human being to ascend by means of inequalities on the surface, the assistance of shrubs, or otherwise. He accordingly commenced climbing the precipice, and taking advantage of every ledge, cleft, and protuberance, finally reached a point, which to his companions far beneath, seemed directly under the great arch. He was far above the names cut on the stone—fully fifty feet above that of Washington—and standing upon a ledge, which appeared to his terrified fellow-students but a few inches in width, shouted aloud, waving one hand in triumph, while with the other he clung to the face of the precipice. They shouted back to him, begging him for God's sake to descend, but he only replied by laughter. They then saw him continue the ascent, clinging to every object at hand, until he reached a cleft almost directly beneath the cedar-stump, which we have mentioned as the scene of Miss Randolph's perilous adventure. His ambition was not yet satisfied, however. He had not ascended the rock to inscribe his name upon it, but with the daring design of immortalizing himself by mounting from the bottom to the top of the Natural Bridge. He accordingly continued his way, working his toilsome and dangerous passage through clefts in the huge mass of rock. These were just sufficient, in many places, to permit his body to pass, and huge roots from the trees above protruding through splits in the mass curled to and fro, and half obstructed the openings. With unflinching resolution, and not daring to look into the hideous gulf beneath him, the young man fought his way on, piercing by main force the dark clefts, crawling along narrow ledges, springing from abutment to abutment, until finally he stopped at an elevation of *one hundred and seventy feet* from the earth below. Here he was seen to look upward, but he did not move. His heart had failed him. Instead of designing any further ascent, his only ambition now was plainly to descend in safety, if possible, from his frightful perch. To look beneath would have been certain death. His head would have turned at the first glance, and losing his footing on the narrow ledge, which he just clung to, his body would have been dashed to pieces on the rocks. Within his grasp, almost, it seemed, was the coveted summit, but he could not reach it; the smooth face of the rock laughed at him.

Under these circumstances the young gentleman acted with a nerve and presence of mind highly honorable to the force of his character. He slowly and cautiously divested himself first of one of his shoes, and then the other, next drew off his coat, and these articles he threw from him into the gulf beneath, without daring to look in the direction in which they fell. Then, clinging close to the face of the precipice, and balancing his body carefully as he placed each foot down, and raised each one up, he tottered along inch by inch, hanging between life and death until he reached a friendly cleft. Here pausing for a moment to brace his nerves, he continued his way in the same cautious manner, followed by the eyes of his pale and terrified friends; when, disappearing in a cleft, he reappeared no more. A cry rose from beneath; he was lost, it seemed, must have fallen into one of the huge fissures and been dashed to pieces. His friends had

given him up, and agony had succeeded the long suspense, when suddenly, from behind a clump of evergreens, extending like a screen across the narrow opening between two towering rocks, appeared the young student—safe, sound, and smiling, after his perilous feat, during which he had stood face to face with the most terrible of deaths.

His exploit might have been foolhardy, but at least he had achieved one distinction—that of having climbed to the highest point ever reached on the face of the precipice at the Natural Bridge.

JOHN ESTEN COOKE.

A VISIT TO GENERAL PRIM.

WHILE the cruel assassination of Prim is still fresh in all minds, I have thought it may not be uninteresting to recall an interview which I had with him last May at Madrid. It did not contain much incident; but when a great man dies, things otherwise unimportant throw some light upon his career, and aid us in forming a final estimate of his character. I had a letter of introduction from a distinguished gentleman in America, and when I mentioned this to our ambassador, General Sickles, he advised me to send it with a note of my own, and then to go with him to a reception-party at General Prim's the next evening. So the next night at eleven o'clock, we went with General Sickles to the palace of the Minister of War, to which Prim had removed, not without some reluctance, from his own modest mansion, when he had been appointed minister. The rooms were very spacious and handsome, and upon the walls were modern paintings of battles in which Prim had borne a prominent part. The *salons* were *en suite*; in the first, after the *ante-camara*, we found Prim, surrounded by a party of gentlemen, to whom he was talking earnestly. Although no one was in uniform, I knew, before I was told, that the majority of the gentlemen were officers, and that the reception was not without a political character. I was told, indeed, that in Madrid each prominent official always thus utilizes his festivities; and so we found ourselves in the army party of Spanish society, as then constituted. At Serrano's one would have met the party of the regency. Our arrival interrupted the general's conversation. He advanced at once and received us very graciously, and with simple cordiality; he then took us into the second *salon*, where we found the *condesa* and the ladies. As there are comparatively few foreigners, and very few Americans travelling in Spain, and fewer still that find access into Spanish society, the entrance of my daughters and myself aroused some curiosity among the *convidados*, and the Condesa Prim received the girls with especial kindness.

Dancing soon began, and we were quite amused at the actions of the eldest scion of the house, a bright, black-eyed boy of nine years, who looked like his father. He capered about the room and flirted with the prettiest ladies; but seeming to reflect that he could attack the hearts of the Spanish beauties at any time, he brought a bouquet to one of my daughters, and invited her to dance, addressing her in the little English he was then learning from his tutor. But he was the only jolly person in the room; every one else and every thing else was decorous, stately, and formal. Every gentleman had his hat—vulgarily known as a stove-pipe—under his arm, and every lady seemed to feel that the occasion was a solemn one. But with all this there was entire urbanity—it was simply Castilian manners.

While others were dancing, I sat with the countess, and soon found that there was something, quite apart from being an American stranger, with which I could interest her. She was a Mexican lady; and, as during our war with her unhappy country, I had spent nine months in the capital, I had become acquainted with many people whom she knew, and was familiar with many of her home-scenes. As she spoke neither French nor English, I was thrown upon my old Mexican-Spanish, of which I made a grand recovery in my efforts to converse with her.

She is a lovely lady, of charming, benevolent countenance, and her good heart, attractive presence, and pleasant manners, have won all hearts in Madrid. Scandal has no softer seat in the world than that same capital, and the society is noted for its impurity; and yet we were told not a breath of ill-report had ever been whispered concerning her. She was a model wife and mother, and at the same time filled her high place in society to perfection.

In a little while General Prim, who had returned for a time to his knot of gentlemen—doubtless in deep conference about the state of the country—came back, and addressed me in French. "But," I said,

"you speak English?" To my astonishment he did not, and my poor polyglot was again tested—we talked in French. He asked questions about America, more I thought for courtesy than for information; he inquired particularly concerning General McClellan, whose headquarters with the Army of the Potomac he had visited, when he was returning from Mexico, and whose kindness he said he remembered with great gratitude. He spoke in very general terms of the condition of Spain, which he said he hoped would soon be ameliorated. He then gave me some suggestions with regard to my further travels in Spain, and promised to visit us at the hotel in a day or two—a promise which he fulfilled.

While he was speaking, I regarded him with great interest as the most distinguished man Spain has produced, perhaps, for centuries. He had risen by his own merit from private station to be the principal statesman of Spain, had been made Conde de Reus, and Marques de Castillejo, and had overthrown a wicked dynasty almost with his own hands. A person of medium size, not large frame, with some outlook toward later corpulence, olive complexion, eyes as black as jet, full beard, and mustache closely trimmed, which, like his hair, were quite black, with little touches of gray. His manners were quiet, and his speech fluent but careful; every sentence seemed prepared beforehand. But his eyes were particularly expressive: at first they had a sleepy, filmy look, but, when more closely observed, they indicated a stealthy watchfulness, a sense of responsibility, which, however, could not weigh him down, and, I thought, a spice of anxiety. He looked like an ambitious man, as he was, reaching out to something attainable indeed, but not without care, exertion, courage, and tact; and all these he impressed one as having quite adequate to his occasions.

I was not surprised to see the interest which his *colerie* seemed to feel in his son; and I heard it more than once said, in an audible whisper, "That is the future King of Spain."

We left at one o'clock with the party of the embassy, the good countess accompanying the ladies to the door of the antechamber, and helping them with their wraps herself, a favor, some one told us, reserved for the higher nobility. We returned to the hotel, while some of the party went, even at that late hour, to the reception of the Countess Montijo, mother of the ex-Empress of France. But a short time has elapsed, and yet it has sufficed to lay our distinguished host in a bloody grave, and driven the empress into exile. Few, if any, at that time heard even the rumblings of the earthquake.

The relative positions of Serrano and Prim were not a little curious; the two men were personally not to be compared. Serrano's rise was due to his being the favorite of the most dissolute queen known to history, not excepting Messalina and the prophetess of Moseilama. He turned against his paramour in the late revolution, and accepted, without striving for, the regency. His handsome form and face catch the public eye, and especially the fancy of the soldiers, and he has lived in his glory without much talent, and with far less virtue, the inmate of one of the handsomest palaces in the world; nor has his elevation seemed to provoke opposition.

Prim was ambitious but virtuous, and, if as a monarchical reformer, he erred, and sought his own advancement, it was through what he believed to be the best for Spain. The army obeyed him, and yet without enthusiasm for his person, but he felt his power, and the commander of fifty thousand men in a single capital may well hope to gain his ends, if military force can avail.

But it must be said that, beyond the army, he had the misfortune to be exceedingly unpopular. Wherever we travelled, out of Madrid, his name was never mentioned among the people without dissatisfaction. Some said he wanted to be king, but never would be; others, that he had betrayed his party. I even heard suggestions that his life was not safe. It was also said that, in last resort, he wanted to be king-maker, and put such a man upon the throne as that he might be the power behind it.

The republicans, at whose instance—or for whose benefit—he was assassinated, wished to remove him, as their great obstacle, and to inaugurate a revolution which should keep the new monarch away. But they struck too late; they strengthened Amadeus I., whose greatest safety is now found in the willingness of the people to put an end to the long suspense, and to have order after legalized anarchy. And for Prim, his death, though untimely, secures his fame; it ranks him with the rulers and statesmen who have fallen victims to fanaticism, and it makes the great fear of his enemies, which prompted the deed, the measure of his greatness.

Perhaps no nation has ever possessed, and thrown away, so glorious a chance of becoming a republic; but the vehemence of a dozen parties neutralized the power of all; and the people, so long the victims of misrule, had not acquired that compactness of purpose and action which could make itself felt in the issue. There is enough of it, however, to suggest a cautious and liberal policy to the new government, while on the other hand the principles which govern the kingdom of Italy give assurance to Spaniards that, without a republic, they may yet be free and happy. In that case Prim will prove to have been a martyr in a good cause, and its success will add to the lustre of his name.

HENRY COPPÉE.

A GERMAN'S EXPERIENCE OF FRENCHMEN.

NOT long after the February Revolution—the Republic was already dead—the most grave political and social questions were one evening discussed in the saloon of a distinguished republican ex-minister.

A man, well known and much esteemed in Paris, spoke most eloquently against war, insisting that it was one of the great duties of the age to do away with war and conquest and the evils that attend them.

"I am right glad to hear you, whom I hope soon to see in the government, speak thus," I replied. "Such views as these will render it easy for France and Germany to be always on the most amicable terms, and, as renewed efforts are made in the cause of liberty, there will be no danger of the boundary of the Rhine becoming an apple of discord to rob us of the fruit of our endeavors."

"Oh, the Rhine!" cried my interlocutor, "the Rhine, that is another matter; the Rhine we must, of course, have sooner or later."

The republican who spoke thus occupies one of the first positions in the Paris government of to-day.

This conqueror of the Rhine belongs to the Blues. On another occasion I heard a Frenchman, one of the most advanced of Socialists, and one of the best of men, who voluntarily left France because he was disgusted with the state of things after the *coup d'état*, express his views on the same subject—on war, conquest, nationality, and the stupid boundaries that divide the various European nations—and, indeed, he discussed the subject in the spirit of elevated philanthropy.

"It is sad," said I, in reply, "that we shall be compelled to wait so long before those who think with you will be able to make their influence notably felt in the government of France, for all the now dominant parties would not let an opportunity pass to bring the Rhine question on the tapis."

"Oh, this war for the Rhine," continued the Socialist, with *aplomb*, as one who makes a statement that he thinks a matter of course—"this war for the Rhine is an unavoidable necessity, but it will be the last. I can assure you, sir, it will be the last!"

In the winter of 1852-'53, Louis Napoleon found it necessary to divert public attention from the discussion of the internal policy of his government, and within a week all Paris was in a perfect tumult on the question of the northern boundary, and everywhere was heard Alfred de Musset's "Song of the Rhine."

At that time I was very frequently at the evening-receptions of Monsieur Costé, the former publisher of *Le Temps*, where the most distinguished Liberals were accustomed to meet. One evening we had been most agreeably entertained with conversation and music until wellnigh one o'clock, when one of the guests suggested that Monsieur X— should sing the "Song of the Rhine." The proposal was warmly seconded by several others, partly on account of the sentiment of the song, and partly because Monsieur X— had made himself quite famous in his circle for the admirable manner in which he sang it.

Monsieur X— was already seated at the piano and played the prelude, when I went to Monsieur Costé and reminded him of the fact that among his guests there was a German, and that he as host should spare his guest the humiliation of listening to the song.

In his embarrassment Monsieur Costé stammered various excuses, and insisted on treating the matter lightly, but I persisted in my protest.

In the mean time the singer had begun. I approached Monsieur X—, and said to him:

"I would remind you that there is a German present. This fact will, I trust, deter you from finishing your song."

A smile of derision encircled the lips of all present. Not only did

they all, for the moment, ignore every consideration that delicacy and politeness suggested, but they even saw in me an enemy. There were a few who went so far as to encourage the singer to continue, which he did with increased energy and expression. I was so weak, I confess, as to become absolutely furious. I advanced a few steps, and made a speech that was in keeping with my humor. By ignoring every consideration due the stranger, they relieved me from the obligations that politeness imposes. To the words, "We once had it—your German Rhine," which the singer, turning toward me, emphasized especially, I replied:

"And we once had your Seine, your Loire, your Rhone—out of pity we returned them to you, while you were compelled to give up the Rhine as stolen property. 'To steal,' says an old adage, 'is no disgrace, but to be caught at it,' " etc.

The singer pounded the piano, and sang as loud as he could to drown my voice. There was a veritable tumult; they were all against me, and not in the whole company was there a voice raised on the side of him who had been insulted.

After saying two or three pretty severe things, I turned my back to the singer, my host, and his guests, and left the house.

The scene made some talk, but beyond that bad no evil consequences. I relate this circumstance for the purpose only of showing that all Frenchmen, on the subject of the Rhine, thought alike; that on such occasions they sacrificed their proverbial politeness and delicacy—those virtues for which they have so long been famous—to their fanaticism. It is possible that, among those present, there was more than one who thought I was in the right, but to say so, the Rhine question being the cause of the dissension, no one had the courage, as at this moment no one ventures to tell France the truth.

I was in the habit, every evening when I returned to my lodgings, of supplying myself with cigars for the next day at a neighboring cigar-store, Rue St.-Lazare. The tobacconist was a man about thirty-five years old, and belonged to the National Guards, who on more than one occasion had demonstrated their willingness to defend the Republic. As I, on the evening of December 2, 1851, that is, on the evening of the first day of the *coup d'état*, entered the tobacco-store, the worthy proprietor received me with a burst of indignation at the vile traitor of a president. Such a betrayal of the most sacred trusts, such a perjured villain the world had never seen! The Frenchman who would tamely submit to such an outrage deserved to be damned to the lowermost depths of perdition!

"But the wretch will not succeed; the people that have made such sacrifices in the cause of liberty will not submit to being robbed by such an adventurer and swindler! He must be hung, hung to one of the lamp-posts of the Tuileries!" On the evening of the 3d, however, my tobacconist had somewhat modified his tone: "One thing we must acknowledge—the rascal managed the affair with great cleverness. Who would have believed it? They thought him a blockhead, and he turns out to be too long-headed for the whole of them. He has managed to have the entire army with him—well, he is a Bonaparte, that's some consolation!"

On the evening of the third day after the *coup d'état* I found in the window of my republican friend, neatly framed, the face turned toward the street, the portrait of—Louis Napoleon!

At that time I was not conscious that I had, in the person of the tobacconist, all France before me, or at least an immense majority of her people.

About a year later I met with a similar experience. I usually dined at the *table d'hôte* of my hotel, where we ordinarily made passing events the subject of our conversation. Among the regular guests there was a landed proprietor from Burgundy, who came every year with his wife and daughter to Paris, to spend some of the winter months, as so many thousand provincial Frenchmen do, in the belief that the little spot called Paris is the only spot in the whole world where a cultivated man can fully enjoy existence.

One evening, in reply to the question as to what there was in the way of news, I replied that, on the following morning, it would be officially announced that the emperor would marry the Countess Montijo.

At this the Burgundy proprietor started up, and cried out, his eyes flashing with indignation:

"That is a calumny! Never will the head of the French Government so disgrace himself and the nation as to share his throne with an obscure adventuress, of a character, to say the least, very questionable." These were only reports, that had no foundation in

fact, reports circulated by the enemies of the government, he added. Louis Napoleon, who had given so many evidences of his wisdom, would never take a step that all France must condemn. He (the Burgundian) deemed it the duty of every good citizen to emphatically contradict all such disgraceful calumnies.

"Bon!" said I; "let the matter rest; to-morrow you will beg my pardon."

He laughed scornfully, and observed that I was not a Frenchman, which accounted for my believing and repeating such absurdities.

On the following morning the matrimonial proclamation was seen on every street-corner of Paris. That evening, when we were seated as usual around the dinner-table, I cried out to the Burgundian:

"Eh bien?"

"Eh bien, c'est grand!" he replied, with a shrug.

And then followed a long and eloquent harangue about the grandeur, the sublimity of this determination of Louis Napoleon's. This marriage was an additional proof to the Burgundian that Napoleon III. was the most extraordinary, the most independent, and liberal-minded man in the world; proud enough to look down with contempt on all the princely houses in Europe, and unselfish enough to listen to the promptings of his noble heart. And, finally, he was, in the esteem of his eulogist, a moral hero—just such a man as France, the leader of Western civilization, needed. And the Countess Montijo must be a very superior woman, or she could never have won the love and esteem of such a superior man. With this marriage would begin a new era for France and for Europe, as such an example could not be without a salutary influence. In fact, the Burgundian considered this marriage as one of the greatest events of the age.

Poor France! Do the French of to-day differ materially from the tobacconist of Rue St.-Lazare and the farmer of Burgundy? I met both in all grades of society; they differed only in their respective titles. Was the gifted Villaut, who, on December 1, 1851, was a republican, and on the 4th an imperialist, any better than the tobacconist? And Baroche? and Dupin? and the millions of others to whom, in 1852, he only was a sensible man, who disavowed his principles, and knew how to ingratiate himself with those in authority? The eighteen years of the second empire were not calculated to make any change in this fickleness of the French people, or to give them any more moral backbone.

When Bazaine returned from Mexico, covered with shame and crime, he dared not show himself in Paris, but retired to the country. Neither citizens nor soldiers could find epithets sufficiently forcible to express their contempt for the man. While he held Metz he was a hero, the hope and the glory of France, and secretly thousands gave him their suffrages for the first place in the gift of the nation. Now, that Metz has fallen, even Gambetta officially brands him as a traitor, and all France reëchoes the cry.

MAURICE HARTMANN.

PROGRESS OF SCIENCE IN 1870.

FROM "NATURE."

THE year which has just come to a close has neither been characterized by many new and striking scientific discoveries, nor have any novel applications of science to ordinary industry and manufacture attracted special attention. The work done has been more a strengthening of that of past years, and a confirming or a disproving of theories and experiments, than the inventing of new ones. In one branch of science only has any great advance been made, and that, as we shall presently show, we believe to have taken place in geology. But this advance is one somewhat overlooked at present; but still of so important a character that, when once fully recognized in all its bearings, it may tend to disprove much of the geological teaching of the present day.

Taking the various sciences as much as possible separately, we will begin with Astronomy. Here attention has been chiefly directed, as has been the case for so many years past, to the sun. Since it is now generally understood that when once the nature of this vast luminous body is accurately made out, much light will be thrown on many now perplexing and strange phenomena, the eclipse of the 22d of December last was anxiously watched for, and all possible observations were taken here by those who were unable to take part in the Government Expedition to Spain and Sicily. It is to be hoped that the labors of this expedition, in spite of accident both on land and

sea, and the unsatisfactory state of the weather at the time of observation, will yet yield results of great importance.

Mr. Lockyer and Mr. Huggins have continued their spectroscopic observations of the sun, and Professor Zöllner has published a very valuable paper on the solar prominences, theorizing very boldly as to the temperature and pressure at the sun's surface; while in America Professor Young has worked with good results at the same subject. Before leaving this branch of our subject, we would mention that Mr. Procter has published some novel views as to the constitution of the stellar systems, which, under the somewhat fanciful titles of "star-drift" and "star-mist," must be familiar to most of our readers.

While the vast domain of Organic Chemistry has been still further widened by the innumerable workers who plunge into this branch of the subject and neglect the many untrodden paths in inorganic chemistry, nevertheless no special or important discoveries are to be chronicled, unless we may mention the beautiful process by which indigo has been synthetically constructed by MM. Emmerling and Engler, following closely on the artificial manufacture of alizarine by MM. Liebermann and Graebe.

Molecular Physics has occupied a large share of attention, and the discussion before the Chemical Society on the existence or non-existence, of atoms and molecules, has only too clearly shown how doctors differ among themselves, and that the very foundations of a science, considered so essential by some, are utterly repudiated by others. A very remarkable paper on the Size of Atoms, originally published in these columns by Sir William Thomson, in which he gives four distinct trains of reasoning by which he arrives at a proof of their absolute magnitude, has attracted much attention, and has been translated and copied into most of the Continental and American scientific journals. Dr. Thomas Andrews has also pursued his remarkable investigations on the continuity of the liquid and gaseous states of matter. The death of Professor Wm. Allen Miller, F. R. S., and Dr. Matthiessen, F. R. S., have left sad voids in the ranks of our English experimental chemists.

In Biology, the investigations of Professor Tyndall, "On Atmospheric Germs, and the Germ Theory of Disease," have contributed to a clearer knowledge of the nature of some of the most virulent of our infectious diseases, and have caused those diseases to be studied in a much more scientific manner than before.

The theory of spontaneous generation, which has been very prominently before the scientific world for the last ten years, has, during the past year, been very strongly attacked on the one hand by Professor Huxley, and defended on the other by Dr. Bastian and Dr. Child. In his inaugural address to the British Association meeting at Liverpool, Professor Huxley gave a long review of all the researches on the subject, from the time of Spallanzani and Needham to the present day, and declared his belief, after carefully weighing the evidence on both sides, that all life has its origin in some preëxisting life, and that spontaneous generation, or, as he termed it, abiogenesis, is not now proved to take place. The investigations of Dr. Bastian, published in these columns, gave the reasons for his belief that spontaneous generation certainly does occur. Feeling himself attacked and his experiments somewhat underrated by Professor Huxley in his address, he criticised it at considerable length, and detailed the results of some new experiments which confirmed his previous deductions.

The Darwinian theory of natural selection has been attacked by Mr. A. W. Bennett and Mr. Murray, and defended by Mr. A. R. Wallace and others; Mr. Wallace having also vindicated his claims to priority in this question, since he published many of the now recognized theories and speculations on the subject of natural selection, at a time when he was resident in the East Indies, and entirely unacquainted with what Mr. Darwin had written on the same subject.

As respects Geology, during the past year the government has continued its grants of money for the purpose of deep-sea dredgings, and at present the report of the most recent expedition is anxiously looked forward to. The results of the expedition in the autumn of 1869, as given to the public by Dr. Carpenter, Professor Wyville Thomson, and Mr. Gwyn Jeffreys during the past year, have been of the greatest possible interest and importance. They found that on the same level, at the bottom of the deep sea, two different deposits are in process of formation side by side, each characterized by a distinct Fauna, and yet apparently produced under perfectly similar conditions of land and sea, area, depth of water, etc. On in-

vestigating this curious result, however, it was found that the temperature of the water circulating over these two areas is very different, and that this mere difference of temperature is capable of entirely changing the character of the fauna of the simultaneously-formed deposits. Thus an entirely new element is brought into geological speculations, since it is shown that at one and the same time strata may be accumulated containing widely-different organic remains. In addition to this, they have shown that the calcareous deposit known to us as chalk is now being deposited all over the bed of the Atlantic Ocean, and there are many weighty reasons for believing that this deposit has gone on steadily ever since the time during which we imagined the cretaceous rocks of the world to have begun and ended. Many organisms formerly supposed entirely extinct have been rediscovered in these deep-sea dredgings; and, in short, much has been done to show that our past geological reasoning requires thorough and careful revision. Professor Gumbel's discovery of the existence of bathybius and similar organisms at all depths, and stretching over an indefinite period of geological time, is of the greatest importance in relation to this subject. Professor Agassiz, on the other side of the Atlantic, has published reports of the deep-sea dredging off the Florida coast, and has stated that the results of his researches, and those of others, both English and Scandinavian, have convinced him that there is life all over the sea-bottom, and that where evidence of marine life cannot be found, we are justified in calling in the agency of the sea to explain certain obscure facts. These conclusions cannot be without their important bearing on many commonly-received geological theories.

In Botany many very careful series of observations have been made in the physiological department. Among the most important we may mention those of Prillieux and Duchartre in France, confirmed by Dr. McNab in this country, that, contrary to the previously-accepted hypothesis, plants do not absorb any appreciable amount of aqueous vapor through their leaves; and those previously announced by M. Dehérain, that the evaporation of water from the leaves of plants is due to sunlight rather than to heat, and proceeds independently of the degree of saturation of the atmosphere. Much attention has also been paid in Germany, Italy, and England, to the phenomena of fertilization opened out by Mr. Darwin's observations.

In Meteorology there is no great advance to chronicle. It still remains a science without a head, a chaotic mass of facts with no definite order or arrangement; for, though many are working at this subject, and some valuable papers on the Origin of Winds and Storms have been published, still no definite progress can be ascertained.

The splendid appearances of the Aurora Borealis, visible all over the British Isles in September and October, have directed public attention to those unmistakably magnetic phenomena, and to the connection which exists between their appearance, great magnetical perturbations, and large solar spots. They have been examined very frequently during the past year by means of the spectroscope, and there is distinct evidence of lines in the green and red portion of the spectrum, the latter presumably due to hydrogen. We would direct attention to our desire to publish a complete tabular list of the more remarkable meteorological phenomena of the past year, so as to be serviceable to observers in all parts of the world. To render this as perfect as possible, we would invite the kind coöperation of all those interested in the subject who can forward us any data.

We cannot conclude without noticing how much science has lost during the latter half of the year just ended by the fearful struggle that has taken place between France and Germany, where each nation has brought into requisition all the resources of science only to inflict as much injury as possible on the other. For nearly six months we have witnessed the sad sight of workshops shut up, laboratories closed, universities and public schools wanting both professors and students, and the friendly emulation of similar tastes and pursuits turned to the fierce rivalry of the sword. Science will have to deplore the untimely loss of many of her most attached workers, and their country will have lost those who would in happier times have done her as much honor at home as they have shown bravery in the field. While the French Academy, shut up in besieged Paris, has brought the art of ballooning to its present state of perfection, so that now it is used as a means of communication with the outside world, the result of the subtle strategy of the Germans, and the scientific education they so generally possess, has been to give them advantages which have, to the present time, baffled their adversaries.

TABLE-TALK.

THE savings-banks of the State of New York hold in deposit nearly two hundred millions of dollars. This vast sum, consisting of the small accretions of about seven hundred thousand depositors, irritates and excites certain journalists and politicians. There is no ground for supposing the affairs of these banks to be mal-administered. They are chartered under very strict legal regulations, and it may be safely asserted that in no other form have funds so vast been employed with so little loss. Savings-banks are pretty nearly the only financial institutions that never fail. In the great panic of 1857, one savings-bank in New York was obliged to close its doors, but it paid, within a short time, ninety-eight per cent. to its depositors. The bank had really been solvent, the small deficit of two per cent. necessarily arising from the costs and expenses in closing up its business. These banks, then, being safe depositories, and having been conducted with uniform probity and success, why does there exist any hostility against them? Partly from ignorance of their real character, and partly from a desire to turn their vast deposits into other channels. Schemes of all sorts, aiming at their welfare, are rife. We hear of plans by which the fund shall be turned in some special way to the advantage of working-people; but the fate of the numerous "building associations" of a dozen years ago ought to make us beware of all such schemes. Our savings-banks are often charged with being "conservative and obstructive," because they do not listen to every theory that speculative minds may advance. It is their imperative duty to be "conservative and obstructive." No pressure should induce them to swerve from their present course, which cannot in any particular, be changed without great danger. They have in charge immense interests, wherein the measure of profit is of no consideration in comparison with the measure of security. And the one absolute principle of finance is, that complete security and minimum of interest are inseparable. These banks have in their hands the slow and painful accumulations of self-denying labor; they hold the widow's mite, the garnered hopes of age, the sole security of innumerable people against deprivation in sickness or old age. There is no fund so sacred. There are no institutions that should be so carefully guarded, so scrupulously respected. They are better than asylums, because they in a measure prevent the necessity of asylums. They are better than any form of charitable dispensation, because they alone, of all the devices of charity, render permanent and radical benefit to the poor. Frugality is the sole means of preventing poverty, and savings-banks afford not only the opportunity for practising this virtue, but they reward it. These remarks are prompted by an attempt recently made in the Albany Legislature to pass a bill directing the transfer from the banks to the State of one-half of their surplus funds, and of all deposits remaining unclaimed for ten years. This hostile legislation is very much to be regretted, but it is only one of the signs of the times.

There seems to be an idea that savings-banks are rich institutions, and suitable objects for legislative warfare. It is apparently imagined that some class other than the depositors are making money out of them. But who can this class be? The banks pay no dividends to stockholders. They give no salaries to trustees or to presidents. They cannot loan to those connected with them, or to any persons, excepting on real estate or government bonds. Whatever profit they make above the interest regularly paid to their depositors, is held either as a margin to cover a possible decline in the value of their securities, or at regular intervals to form a special dividend to depositors. The surplus funds, then, that the State purposes to take possession of, belong to widows, orphans, sewing-girls, artisans, laborers—the honest, laborious, struggling poor. It is theirs beyond all right of confiscation, all show of legal interposition. And as for unclaimed deposits, every bank-officer will testify that it is not uncommon for claimants to appear after very long intervals. Money is sometimes deposited for a child at its birth, and the bank hears nothing more in regard to it until it is claimed at the majority of the infant. Money is sometimes deposited by people who afterward remove to other States, or wander off to other parts of the world, and who, after many years, reappear either to add to their deposits, or withdraw them. Imagine a man laboring and struggling in far-off places, consoling himself with the thought of that little sum in a distant city which, year after year, is slowly increasing, and which he means, if possible, never to touch until old age comes upon him—imagine this man, at last, in dire distress, or stricken in years, coming to demand his little, long-garnered means, and learning, to his indignation and dismay, that the State, which should have been his protector, has been his despoiler—that all his self-denial, his long waiting, his hopes, have come to naught! If the Legislature touches the funds of these banks, it confiscates where it should protect; it destroys where it should build up.

— We had just written the above when we discovered, in the *New-York World*, in an article termed "A Word of Advice to Laboring-men," the following paragraphs:

"By far the largest amount of money placed in savings-banks throughout the country belongs to mechanics, working-men, small shopkeepers, and domestics—belongs, in a word, to the working-men or those most directly connected with them. Yet the deposits in the savings-banks of New England and New York alone considerably exceed the enormous sum of four hundred million dollars—more than the total bank capital of the whole United States. The working-men of New England and New-York State are to-day the owners of a very large proportion of the enormous sum of four hundred million dollars. Yet they are constantly deploring their inability to develop coöperative business schemes from want of the capital and credit which they say is controlled exclusively by the employer class.

"Of course it is controlled by the employer class. But, as far at least as the capital of the working-men is concerned, it is so controlled only by the full and free consent of the working-men themselves. Said the Hon. E. R. Mudge, of Boston, chairman of the recent great

dinner to the woollen-manufacturers in this city: 'The fact is, that our largest manufacturing corporations borrow more money from savings-banks than from any other one source;' and his testimony on this subject is entitled to full credit. No doubt the Fall-River companies, who, previous to the mule-spinners' strike last June, would not 'condescend' to tell their employes why their wages were reduced, were at that very time running their mills on the money of those very employes, which they had borrowed from the savings-banks. The deluded mule-spinners thought the great corporations were the capitalists, and they submitted because they could not resist the pressure of the capital employed against them, when, in truth, the principal part of the capital employed against them was nothing in the world but their own savings. . . . Far from us to impugn the rectitude, the safety of our savings-banks' management. The money of the working-men is, no doubt, quite as safe when loaned to 'our largest manufacturing corporations' as it could be anywhere. But what would be the influence on the position of working-men if this sum of four hundred million dollars, or even one tithe of it, instead of being loaned to 'our largest manufacturing corporations,' were loaned under proper restrictions and safeguards to working-men's firms carrying on the same business?'

Nothing is so discouraging to the friends of savings-banks as the apparent impossibility of making people understand the simplest principles concerning them. Savings-banks have no power to discriminate between persons. It is their duty to loan their funds on the best security only, and their charters give them very little liberty of choice. Coöperative bodies of working-people have exactly the same opportunity to borrow of these banks that "our largest manufacturing corporations" have, but neither the one nor the other can borrow, or ought to be able to borrow, excepting on unquestionable guarantees. If money were loaned to organizations of working-people, merely as such, on any securities inferior to those now required, we should find the savings of one set of work-people endangered to benefit another set of work-people, and we should soon see distrust and disorder introduced into a system that is now perfectly stable, and which has the entire confidence of those most concerned. We doubt very much whether depositors would consent to any such change. But the funds of savings-banks are, in truth, loaned to working-people. In whatever way they are employed, they act as the sustenance of labor; and it is one of the admirable features of these institutions that while giving security to the savings of labor, they at the same time are the creators of wages. If New-England mills are run upon means borrowed of savings-banks, then how is this capital "employed against" the laborers by thus giving them employment? If it were not for banks, the savings of people would either be wasted, hoarded in old stockings, or hidden in corners. The banks gather up a vast number of small accretions, and hence utilize as capital that which, held by its individual owners, would be powerless. And it is impossible for this fund to be employed in any way without acting directly to the advantage of work-people. It builds factories, it constructs railroads, it sets looms in motion.

It is capital owned, indeed, by artisans and laborers, but it could not be utilized better to their advantage than it is now without in some way impairing its safety. There can be no doubt about this. No financier, merchant, or other, can by any device attempt to increase his profits without adding to his risks. And, just so long as in savings-banks the first consideration, the second consideration, and the last consideration, must be *safety*, the funds of these banks will have to be invested in their present guarded and secure manner. We believe this to be a principle as fixed as the hills.

— The most impressive evidence of our rapid growth in luxury, and it may be in refinement, is to be seen in the great jewelry-store of Tiffany & Co., recently opened in Union Square, in this city. This "casket of jewels" covers ten thousand square feet of ground, is five stories high, substantially built of iron, and cost three-quarters of a million of dollars. Its contents, we suppose, are worth considerably more than the casket. Let us look at some of these articles and inquire their prices, for the benefit of our readers in the country and in the backwoods, who may wish to know what the city-folks do with their money. Prominent among the things which first meet the eye of a visitor are the bronzes, which are all from Paris, and from the most noted workshops of that city. Those from the justly-celebrated foundry of Barbadiene, are wonderful in the anatomical modulation of the human figures represented. The designs are all artistic and graceful, and follow the great masters in sculpture. Near the entrance are two life-size figures, the largest ever imported into this country; their value forty-five hundred dollars. Between these is a card-receiver on a tall and graceful stand; its price is four hundred dollars. A beautiful group, "Hector and Andromache," by Gregoire, three feet high, and two figures by Carrier, "Undine," and an "Amazon," are also noteworthy and very costly. But, passing from the bronzes which may perhaps be considered works of art rather than of mere luxury, let us look at the fancy articles. Perhaps the most interesting of these are the dressing-cases, desks, and library-sets, of which there is every variety. They come from Paris, Vienna, and Geneva, and are made of various sorts of wood—as rosewood, satin-wood, coromandel, English walnut, Pollard oak, Spawood, Thuya-wood, etc. Some of these cases are beautifully inlaid, and ornamented with agates, malachite, silver, or ivory. Their purposes are as various as their styles. There are gentlemen's and ladies' dressing-cases—these made chiefly of Russia-leather—which are fitted out in a style of elegance and extravagance difficult to imagine. Combs of tortoise-shell, brushes of ivory, cut-glass bottles with solid silver tops, heavily gilt; innumerable little instruments and tools of the finest steel, until, at last, we find dressing-cases that cost five hundred dollars; and yet these are among the most salable of any, a proof of our growing wealth, if not of our growing taste. Here is a library-set with the ink-stand, paper-weight, pen-tray, candlesticks, taper-stand, paper-knife, seal, and other articles of malachite; this set is valued at six hundred and

seventy-five dollars; in another, the articles are of gilt bronze, richly studded with turquoise and Bohemian garnets, and inlaid with choice agates; this set is worth five hundred dollars. Next to these are fans, the price of which is one hundred and fifty dollars, the latest style being of point lace over silk, with mother-of-pearl, or tortoise-shell handles. Passing over the silver plate, which, if costly, has yet real value, and of which some pieces are worth thousands of dollars, let us glance at the specialty of the house, the jewels and precious stones. Here are five strings of pearls, valued at twelve thousand dollars; a *solitaire* diamond ring, price seven thousand dollars; a small tray of such rings, containing perhaps fifty, valued at one hundred thousand dollars; a single *brilliant*, not set, whose price is twelve thousand dollars; a set—necklace, brooch, and ear-rings, of pearls and diamonds—thirty-two thousand dollars. Then there is a "pendant," containing thirty diamonds, which costs eleven thousand dollars; an opal and diamond brooch nine hundred and fifty dollars; another of pearls and diamonds in silver setting, twenty-three hundred dollars. There are hair ornaments composed of little humming-birds, set in emeralds, rubies, and diamonds; superb cameos, carved in Italy, with the perfection of artistic delicacy; a little gold quiver filled with arrows, one of which, being touched, reveals a tiny watch, not larger than a three-cent piece, *which goes*. Another watch is contained within a gold ornament, imitating the tulip; and still another is a small globe set in diamonds and sapphires, accompanied by a chain similarly ornamented—and the price of this toy is six hundred and fifty dollars. A very fine cameo bracelet, diamond-studded, costs fifteen hundred dollars. A single plain but very beautiful diamond cross, containing twelve stones, is priced twenty-eight hundred dollars; and a tray of crosses, in pearls and diamonds, is worth fifteen thousand dollars. And, to crown this display of fanciful extravagance, here are two pen-holders, made of gold and glistening with diamonds, whose price is four hundred and twenty-five dollars!

— The London *Saturday Review* has given, in its series of social essays, a paper on "Noise." Noise is the arch-enemy of the overwrought brain, and one of the effects of culture is to subdue social noise and all clamorous expression. But noise is by no means the universal evil modern ultra-refinement would have it. There are conditions of life where silence is so prevailing that the ear craves sound, and the spirit becomes sluggish for want of it. Sound is often a stimulus, and is absolutely necessary to a full sense of existence. In country-life, the craving for noise often leads the rustic to turbulent scenes. We may imagine the charm of market-day to dwellers in rural solitudes. "The confusion of sound brings a new sense of life and brotherhood: the crack and crash, the rattle and grinding of wheels, the multitudinous cries, the snatches of talk and laughter, the tread of numbers, and, over all, clocks and chimes and bells, each sound demanding, insinuating, clamoring to be heard, and diverting the thought for the moment to itself, and yet all harmonizing into a busy-bee-like unity of pur-

pose." The idea of religion, even, in the unlearned mass who pass their lives in silent, solitary occupations, is so inseparably associated with noise that it is almost impossible to instill the one without some aid from the other. But noise, in the progress of civilization, is losing its mission. Modern nerves recoil from the rude charm of mingled discords. We cannot now discover the spirit-stirring quality of the *car-piercing life*, as described by Shakespeare. We are amazed that the word *shrill* should have been used by old poets as complimentary. We are puzzled that Sir Walter Scott should have enjoyed "the frenzied rivalry of contending bag-pipes." The riot and din of revelry in ancient times confound us. All that clatter which once was inseparable from high spirits seems to us now simply savage, and what was once to us a sympathy has become an antipathy. But, where there is great vitality, there is sure to be noise. Mirth is always outspoken. In houses where noise is an offence, the children grow up losing a tonic. We miss a flash in the eye, a spring in the step, a ring in the laugh, which a little noise, indulged in at odd times, might have instilled into the system. Noise, therefore, is a part of education. Too much silence makes us morbid and sluggish; the ear has its necessities, like other organs, and the brain, if often oppressed and wearied with noise, is as frequently stimulated and invigorated by it. Lawful, recognized noise, concludes the *Review*, is one of the important elements of healthful life, along with fresh air and pure water.

War Notes.

The Siege of Paris.

(From our Paris Correspondent, by Balloon-mail, December 24, 1870.)

FROM the 16th to the 20th inst. hostilities between the belligerents were almost entirely suspended, both armies having been engaged in perfecting their offensive or defensive preparations. The order of General Trochu to shut all the gates of Paris on the 19th inst. was a significant hint of further sorties being attempted. Two well-appointed armies were rapidly concentrated to the east in the wood of Vincennes, and to the west in the peninsula of Gennevilliers, the combined forces of which equally threatened the half of those of their adversaries concentrated around the northern or southern semicircle of the city. Early on the morning of the 21st one hundred and eight battalions of the mobilized National Guard, numbering sixty thousand combatants, supported by four batteries of artillery and one of mitrailleuses, forming the reserve, marched to the wood of Vincennes. Their passage, at two o'clock A. M., through the city, from the Place Vendôme to the Place du Trône, attended by their friends and relatives, their bayonets glancing in the dimly-lighted streets, and the adieus, good wishes, and entreaties, that arose on all sides, presented a scene at once extremely picturesque and intensely pathetic. At day-break, on the same day, many of the positions held by the Germans, in front of the semicircle from Mont Valérien to the fort of Nogent, were attacked by the French, whose efforts ceased only with nightfall. The most of those attacks were simple feints to distract the attention of the Germans from the points seriously menaced. The operations of the French were

chiefly directed against the positions of Neuilly sur Marne, Villa Evrard, and Maison Blanche, which, after a bombardment of six hours, were gallantly carried by the French troops, who preserved and fortified them under the direction of Generals Vinoy, Malroy, and Blaise, the latter of whom fell, mortally wounded. General Favé, commanding the artillery, was also seriously wounded. An attack, led by the seamen under Admiral de la Roncière, against the village of Bourget, did not prove successful, and the column had to retreat after losing a third of its effective force. This result was attributed to the state of fog then prevalent. General Duerot, having moved forward his heavy artillery, opened a tremendous fire upon the German batteries of Pont Iblon and Blanc-Mesnil, many of the pieces of which were reduced to silence, and succeeded in taking possession of the important villages of Grosley and Drancy. General Noël, advancing with a strong column under the protection of the guns of Mont Valérien, made a reconnaissance to the left against Montreton, in front against Buzanval and Longboyen, and to the right against the island of Chiard, from which the Germans were expelled after a severe struggle. The commander of the artillery of Mont Valérien, M. Faure, was grievously wounded while leading the free-shooters of Paris into the island. This position being of great strategical importance for the further operations of General Trochu, has been intrenched and fortified.

The mortality of Paris is always on the increase, having risen this week from twenty-four hundred and fifty-five to twenty-seven hundred and twenty-eight deaths. This result may be regarded as an indication of increasing sufferings and miseries, which, of course, fall with peculiar severity upon the weaker members of the community.

The casting of cannons, and the manufacture of mitrailleuses and chascapots, are carried on with prodigious activity, as it is felt by all that not a moment must be lost in preparing the means for the final effort.

The severe frost prevailing on the 22d, 23d, and 24th inst. has suspended further operations. The troops at the front, in spite of the hardness of the soil, have been constantly employed day and night in intrenching and fortifying themselves. They are now in the best of spirits, and confident of obtaining, under their present leaders, ultimate success. The lines of investment being gradually extended will soon be broken through at the most important points, which will oblige the Germans to retreat to the frontiers and continue the campaign in Lorraine and Alsace. The efforts made by men of science in Paris to multiply the means of defence, and increase or economize the stock of aliments, are in the highest degree praiseworthy, and at the same time honorable to their inventive genius. Substitutes for butter, cheese, extract of meat, and jellies, have been made from grease, cocoanuts, bones, horns, hoofs, bowels, and livers of animals. Many sauces of great delicacy have also been invented by them.

A Vivid Picture.

M. Feydeau, a French author of some note, writing to the *N. Y. Tribune*, thus vividly portrays the condition of France: "When, in the month of last July, at Paris, I struck at every step against drunken bands vociferating the 'Marseillaise,' and crying 'A Berlin!' I could not help saying, 'These people are my countrymen; I cannot, therefore, wish them misfortune; but if they should happen to return shorn—they who were going out for wool—this would be according to the logic of things, and

no one would have a right to be surprised at it.' Still, it must be confessed, that the bloody tragedy which we now witness has something which confounds the spirits least susceptible to emotion. The world has never been a witness of more mournful cataclysms, never has it had to deplore more repulsive horrors. It would require a Shakespeare and a Tacitus together to seize and to express properly all the afflicting phases of this unfinished drama. Humanity here exhibits itself under the most odious and most sinister colors. What knaveries, what low calculations, what strange aberrations, what headlong disasters, exhausting in the space of a few weeks the last resources of a great country! The Prussian minister and the French usurper, seeking for two years to lay snares for each other, under pretext of dividing provinces which belong neither to Germany nor to France, each one of them preparing himself slyly for war, loading the other with protestations of friendship; then those neighboring peoples, formed to live in peace with each other, and whom it is sought to persuade they have always detested each other; this puerile entry into the field, where there is nothing found to praise but the heroism, made to order, of a child; those victories, pompously announced in advance, which result in the unspeakable capitulation of Sedan; and, after the empire is crushed out in blood, this campaign of savages which begins, these conflagrations, these robberies, these murders of francs-tireurs, of Gardes Mobiles, this insolent cutting to pieces of one of the richest countries of the world, this shooting of peasants guilty of having defended their firesides, these eternal requisitions of delicate wines and cigars, are, as the vulgar conqueror says, with the intention of demoralizing rotten France, Divine Providence having deigned to choose him, this simple-minded king, to accomplish this good work. And, alas, this is not all. While the country is pouring out the last blood of its children to repulse the invader, while the government is organizing, contracting loans, reassembling armies, making appeals to Europe to save the centre of civilization which it has given itself the mission to defend, reverses continue; Strasbourg, Metz, and Toul capitulate, and from this moment all France falls into a chaos a thousand times more frightful than that from which she was drawn by twelve centuries of prosperity. All is, in fine, crushed, polluted, suppressed, annihilated, in a country which was, up to this time, the most lovely, the most gracious, the most chivalrous in the world. Commerce exists no longer; industry is paralyzed. There is no longer a vestige of public service, neither posts, nor telegraphs, nor railroads. The few journals which exist are silent and do not circulate. Families, friends, the learned, the educated, can no longer correspond with each other. Scarcely any news of the rest of the world arrives in France, and it is with difficulty that France, thanks to adventurous expedients such as pigeons and balloons, can inform other nations of the world of the events occurring there—a state of things which no other people, either through interest or through gratitude, or through a spirit of Christian charity, dreams of putting an end to. Is this picture exaggerated? Far from it. It expresses scarcely the shadow of the truth. The horrible year 1870, which will have seen so many fortunes fall, so many great and splendid affairs fail, such flourishing branches of commerce come to ruin, such great hearts and high intelligences extinguished—this year which will be in history forever accursed, year of death, year of sterility, will not give its date to a book, to a statue, or to a picture, or to a page of music, or to a scien-

tific discovery, or to any progress whatever in any place on the globe; for the day when France extinguishes her torch darkness covers the universe."

The German Empire.

The Burggraf of Nürnberg, Elector of Brandenburg, and King of Prussia, is about to grow into an Emperor in Germany. This gradual rise is really not unlike the gradual rise, in the rival land, of the Count de Paris into the Duke of the French, and of the Duke of the French into the King. That no prince of the house of Capet ever took it into his head to call himself by the highest title of all might in these days be taken as a sign of the discretion of the princes of the house of Capet. But the truth is that, as long as words retained any meaning, it could never have come into the head of any sovereign of Paris to take to himself a title which would have been absolutely meaningless. Two Bonapartes did indeed at different times array themselves in the peacock's feathers of empire; but in the earlier case it was part of a system of imposture which paid, while in the later case the thing was sheer imitation. And possibly in both cases there may have been some secret shrinking from clothing a novel and abnormal power, founded by an adventurer of foreign birth, with that simple title of kingship which had been lawfully handed on through so many generations of native Frenchmen. The elder Bonaparte, as all the world knows, gave himself out as the successor, perhaps more strictly as an *avatar*, of the mythical Charlemagne. The younger could only give himself out as the successor or *avatar* of his unhappily not mythical uncle. But in either case the thing paid; grotesque as the title was in itself, it served its purpose, as expressing a state of things which was felt to be, and was meant to be felt to be, something different from lawful kingship. The assumption of the imperial title by the chief of united Germany stands on quite different grounds. It has a real historical meaning. The German king had a right, by virtue of his German election, to be crowned Roman Emperor, but he was not emperor till he was so crowned. It should not be forgotten that all the emperors after Charles V. were in strictness only emperors-elect, and were so called in documents which made any pretence to formal accuracy. But an "erwählter Kaiser," an "Imperator electus," easily came to be called *Kaiser* and *Imperator*, without the qualifying adjective; and a Roman Emperor-elect, who was also a King of Germany, easily slipped into an Emperor of Germany. Looked at, then, as a matter of legal and historical technicality, the title of Emperor of Germany, though not strictly accurate, is not the same grotesque absurdity as an Emperor of Austria, an Emperor of Hayti, or an Emperor of the French. And, again, "*Kaiser in Deutschland*" is not quite the same thing as "*Kaiser von Deutschland*," the use of the preposition is the same as in the later imperial style after Maximilian. The emperor-elect was "*König in Germanien*" as part of his imperial description, a delicacy which was lost in the Latin version "*Germaniæ Rex*." The difference is surely an intelligible one. The new emperor will not be "Emperor of Germany" as a territorial empire; he will be "Emperor in Germany," one who holds an imperial position in Germany—a description which cannot be called inaccurate. Emperor, Kaiser, in the oldest and strictest sense, he cannot be, as having no connection with the local Rome, old or new. But, as a king of kings, he will hold in Germany a position which is distinctly imperial.

The United States of Germany.

The Germany of which William of Prussia is emperor, would be more appropriately designated by the appellation United States of Germany. For, the twenty-five states and principalities composing the so-called German empire are united by a governmental bond that conforms much more to our ideas of a free republican constitution than to the notions usually prevailing in regard to the nature of an empire. An examination of the outlines of the constitution of government under which the new empire is to be ruled, will show that, contrary to the predictions of those who prophesied that "Prussian despotism" would be strengthened by the war, the result is likely to be the curtailment of Prussia's power, and the enlargement of true German liberty. The twenty-five states or principalities forming the United States of Germany are the following:

Prussia.	Saxe-Coburg-Gotha.
Bavaria.	Saxe-Altenburg.
Saxony.	Waldeck.
Wurtemberg.	Lippe-Detmold.
Baden.	Schwarzburg - Rodolstadt.
Hesse.	Schwarzburg-Sondershausen.
Mecklenburg - Schwerin.	Reuss-Schleiz.
Brunswick.	Schaumburg-Lippe.
Oldenburg.	Reuss-Greiz.
Saxe-Weimar.	Hamburg.
Mecklenburg-Strelitz.	Lubeck.
Saxe-Meiningen.	Bremen.
Anhalt.	

Of these twenty-five states, four are kingdoms, three free cities, and the remainder grand-duchies, duchies, and principalities. The area of the empire is two hundred and four thousand seven hundred square miles, and its population thirty-eight million five hundred thousand. With Alsace and Lorraine the latter would reach forty million.

Novel Use of Billiard-table Cloth.

The Bavarian Light Horse, in their passage through France, found, it is said, the material for a new Sunday uniform in the green baize of every billiard table, and wherever they met with one set their knives and scissors to work.

Food in Paris.

There are some things "our own correspondent" does not tell us clearly. Although he sends off, *par ballon monté*, a dispatch as often as circumstances permit, we do not know as much as we wish of the daily life of the unfortunate Parisians. From another source, however, we learn that the allowance of meat at the end of November was only thirty-five grammes—equal to one and one-sixth ounces—per diem per head for adults, and half that amount for children. The correspondent of the *Food Journal* sends over a few interesting particulars, which we quote, of the state of Paris. He says:

"The idea that two million people, a large number of whom have ample means, should find themselves rationed like soldiers and paupers, is so novel that nothing but the actual experience of the fact can bring it directly home to the mind. That people who are accustomed to delicate eating, to every culinary luxury, who *fast* on delicious fish, the freshest of eggs and vegetables, water-fowl, and splendid fruit—say once a week—should now *feed* every day on an ounce or two of any kind of meat that they can obtain—beef, horse, etc.—is certainly an extraordinary form of sybaritism of the nineteenth century."

The consumption of horse-flesh is, of course,

almost universal, and even the subject of puffing:

"A horse-butcher, the other day, exhibited the following placard: 'Horse of the first quality, from the stables of the Comte de Lagrange.'"

The writer says:

"Some persons prefer it to beef, from the gamy flavor which it possesses, and compare it to *chevreuil*—the small doe venison of France—which certainly scarcely deserves the name; others particularly dislike it for the same reason. This is, however, simply a matter of taste. As good, wholesome food, it has been universally eaten; and the soup made from it is declared by every one to be superior to that from beef."

Smaller game, however, is not neglected by these masters of the culinary art; and dishes indigenous to China now find favor in the most civilized capital of Europe:

"Cat is eaten and sold openly, and, although I never had the pleasure of partaking of a civet of the kind, to my knowledge, I can assure you that cats are relished by a good many people, and are quoted at six francs each, while dog is quoted at four francs the half animal. One journal declares that more than twenty-four thousand cats have been sold and eaten. A student in medicine sent the following note to a friend: 'Come on Saturday to my rooms, and eat a broiled cat, seasoned with pistachio-nuts, olives, gherkins, and pimento, and washed down with Chablis. After dinner we will drink some Rhenish wine to the invisibility of France.' At a good house, the other day—the house of a *gourmet*—the bill-of-fare was: *Filet de cheval rôti, escaloppes d'anon, plum-pudding, au graisse de beef.*"

On the subject of prices, this correspondent—to whom we are indebted for the best account of the food-supply of Paris which has reached us—says:

"Bread is plentiful and cheap: ham, 6s. 8d. per pound; Lyons sausage, 12s.; a turkey, 52s. 6d.; a rabbit, 15s.; an eel, 15s.; a plate of gudgeons, 5s.; twelve eggs, 3s. 10d.; a cabbage, 10d.; a bunch of carrots, 2s."

The prices of delicacies are enormous: a *pâté de foie gras* costs forty-five francs, and a turkey with force-meat fifty-five francs. This was on the 25th of November; now, in all probability, these prices are nearly doubled. But the beleaguered citizens bear up bravely—as yet. The writer in the *Food Journal* says:

"In the midst of all our annoyances we have our jokes. When dinner is ready, some one is sure to say, 'To horse, ladies and gentlemen, to horse!' Stories are told of commanders of besieged towns who presented to their guests, as choice dishes, a roast cat, garnished with a dozen of mice and a *salmon* of rats. The following is one of a dozen *vers-de-table*:

'Manger du rat, du cheval, ou du chien,
Cela nous repose,
Quand on l'ignore, ce n'est rien;
Quand on le sait, c'est peu de chose.'

A woman is detected stealing out of a house with something hidden under her shawl; she is arrested, and a fine cat found upon her. 'Oh, pray do not expose me!' she cries, in a plaintive voice; 'it is for a poor sick friend.'

German Republicans.

German republicans probably watch with complacency the establishment of the empire. Their adversary has henceforth a single neck, and if at any time they are strong enough to change the form of government, their republic will be ready to their hands. The enemies of monarchy have lately concentrated their animosity on the King of Prussia, with the plausible pretext that he and his minister deliberately pursue a warlike policy with a view to the maintenance of military despotism. If the charge should prove to have any foundation,

perseverance in the alleged system will arouse a formidable opposition. It is probable that a large part of the population of Germany already regards the prolongation of the campaign with disappointment and dissatisfaction, and it will be impossible to repeat the experiment of an equally popular war. Unless Russia were unwise enough to assail German feelings or interests, no opponent who could be selected would arouse a genuine spirit of national antagonism. The German Parliament will probably be independent enough to resist a warlike and aggressive policy. The middle classes who in Prussia struggled long and resolutely against the king's schemes of military organization will, as far as they are represented in the German Parliament, continue to urge the reduction of the army. The heir of the empire is believed to share their opinions; and, if the liberal party is defeated, the republicans may have a chance.

Alsace.

The new general government of Elsass proclaimed by the King of Prussia, embraces, in addition to the departments of the Rhine which constituted the former Alsace, the *arrondissements* of Saarbours, Château, Salins, Saarguemines, Metz, and Thionville, taken from the departments of Moselle and Meurthe, in Lorraine. With the addition of these districts, the boundary of the new province marks out very nearly the German-speaking part of France. The fortresses of Thionville and Metz in the north, the natural barrier of the Vosges Mountains, and again the fortress of Belfort, in the south, will then protect the frontier of Germany toward France. From an article in the December number of *Pttermann's Mittheilungen*, we learn that the new government has an area of five thousand eight hundred and twenty-five English square miles. This space is considerably larger than Connecticut, and it cuts off a thirty-sixth part from the whole of France. The fertility and industries of Elsass, however, support a population of one million six hundred and thirty-eight thousand five hundred, or a twenty-third part of the inhabitants of France, and the density of its population is comparable to that of the plains of China. In the new government the purely German-speaking area measures four thousand four hundred and twenty-five square miles; the purely French parts, which lie chiefly round the fortresses in the north and south, are together nine hundred and eighty-five square miles in extent, and the territory of a mixed language, which lies in patches between, makes up an area of four hundred and fifteen square miles.

Miscellany.

Young Ladies as they are.

WE have lately heard so much discussion of what is called "the movement on behalf of women," that it is a relief to find that there are still women in the world whose thoughts are occupied with love, dress, and cookery, and who seem to have neither grand aims nor lofty aspirations, nor any desire for what is called the "intellectual development" of their sex. We suspect, indeed, that the vehement advocates of woman's rights would denounce the editor of the *Young Ladies' Journal*, like Canning's knife-grinder, as a "wretch whom no sense of wrong can rouse to vengeance," and we suspect also that this editor would be tolerably comfortable under the denunciation. To judge from a copious correspondence, the young ladies who read the *Journal* have aims and aspirations which their more exalted sisters would

probably deem contemptible. They write to the editor to inquire how they may obtain white hands and avoid red noses. The questions of these correspondents are not given, but we may infer from the answers that one young lady inquired how she might look intelligent. The editor properly answered that by study and observation she might not only look, but become intelligent. She is advised to mix in society as much as possible, and employ her leisure in study; but it is to be feared that the object of this advice is to enable her to please men, and not to show how she may rival them. Another piece of advice appears to be founded on the old maxim of the cookery-book, "First catch your hare." A lady is recommended not to mark any of her linen until after her marriage. "Then let it bear your married name." A pretty domestic picture might be made of Mrs. Smith marking pocket-handkerchiefs while Mr. Smith contemplates the process, and feels that he is comfortably bagged. Several correspondents desire to be informed on which finger the "engaged ring" is to be worn. It is a frequent practice to subjoin to questions on other subjects a request to the editor to give an opinion on the handwriting of the questioner. A young lady who desires to know how she may keep herself bright and fresh-looking, is advised to rise and retire to rest early and to take plenty of out-door exercise. The same young lady is informed that oysters and stout are considered good to take before singing. "A Sailor's Bride" is instructed in the art of making vegetable-marrow preserve, which we conjecture may be intended for the sailor to take with him to sea. "A Disappointed One" is informed that it is very early to show wrinkles, which good health and a happy temper should keep away for another ten years at least. The editor receives a vast quantity of "poetry," which, for the most part, is very summarily dealt with. Thus "Emily" is asked why she writes such nonsense verses. "A love-song needs something more than rhyme. An idea is at least desirable." Equally severe is the criticism on "Brida," whose lines are declined because they are deficient in rhyme, and do not contain an idea that has not been done to death by amateur poets. Next to the character of handwriting, correspondents seem to be most solicitous about the color of their hair. One answer is, "Dark brown; a very fine texture. Writing good." Another is, "We advise you to be content with the color of your hair as it is, and not to attempt to alter it." It may encourage young gentlemen to know that one, at least, wrote to the editor and got an answer; but we think he must have put a very improper question, since the answer is "Certainly wrong, unless she were decidedly engaged to the gentleman." The same correspondent is informed that he cannot take any thing to remove a natural and healthy color without injury to his health. A young lady who suffers under the same distressing affliction of vigorous health is recommended not to be ashamed of the indication of it, and not to take drugs to make her pale. "They may bring on indigestion." Another correspondent is informed that there is no way of compressing the waist without injury to the health. Another is answered that cold tea is harmless. "We do not think it would have any effect upon your complexion." Another is assured that if she keeps in good health her complexion will be good. Another is informed that her handwriting, although not elegant, is very legible. Those correspondents who do not write well are advised to practise assiduously with good copies. We hope that the confidence of the editor in this method of improvement is well founded.

The Daddy Long-legs and the Fly.

I.

Once Mr. Daddy Long-legs,
Dressed in brown and gray,
Walked about upon the sands
Upon a summer's day.
And there among the pebbles,
When the wind was rather cold,
He met with Mr. Floppy Fly
All dressed in blue and gold.
And, as it was too soon to dine,
They drank some periwinkle wine,
And played an hour or two, or more,
At battlecock and shuttle-dore.

II.

Said Mr. Daddy Long-legs
To Mr. Floppy Fly,
"Why do you never come to court?
I wish you'd tell me why.
All gold and shine, in dress so fine,
You'd quite delight the court.
Why do you never go at all?
I really think you ought!
And if you went you'd see such sights!
Such rugs, and jugs, and candle-lights!
And, more than all, the king and queen,
One in red, one in green!"

III.

"Oh, Mr. Daddy Long-legs,"
Said Mr. Floppy Fly,
"It's true I never go to court,
And I will tell you why.
If I had six long legs like yours
At once I'd go to court,
But oh! I can't, because my legs
Are so extremely short.
And I'm afraid the king and queen
(One in red and one in green)
Would say aloud, 'You are not fit,
You fly, to come to court a bit!'"

IV.

"Oh, Mr. Daddy Long-legs,"
Said Mr. Floppy Fly,
"I wish you'd sing one little song,
One mumbian melody.
You used to sing so awful well,
In former days gone by;
But now you never sing at all;
I wish you'd tell me why.
For if you would, the silvery sound
Would please the shrimps and cockles round,
And all the crabs would gladly come
To hear you sing, 'Ah, Hum di Hum!'"

V.

Said Mr. Daddy Long-legs:
"I can never sing again!
And if you wish, I'll tell you why,
Although it gives me pain.
For years I cannot hum a bit,
Or sing the smallest song;
And this the dreadful reason is,
My legs are grown too long.
My six long legs, all here and there,
Oppress my bosom with despair;
And if I stand or lie or sit,
I cannot sing one single bit."

VI.

So Mr. Daddy Long-legs
And Mr. Floppy Fly
Sat down in silence by the sea,
And gazed upon the sky.
They said: "This is a dreadful thing!
The world has all gone wrong,
Since one has legs too short by half,
The other much too long!
One never more can go to court,
Because his legs have grown too short;
The other cannot sing a song,
Because his legs have grown too long!"

VII.

Then Mr. Daddy Long-legs
And Mr. Floppy Fly
Rushed downward to the foamy sea
With one sponge-taneous cry;
And there they found a little boat,
Whose sails were pink and gray;
And off they sailed among the waves
Far, and far away.
They sailed across the silent main,
And reached the great Gromboolian plain;
And there they play for evermore
At battlecock and shuttle-dore.

Tobacco for the Wounded.

There is no deprivation which the habitual, although not excessive, smoker feels so much as the loss of tobacco; and soldiers of all nations, especially of the French and German nations, smoke it. It was a standing injunction with the First Napoleon that his troops should have tobacco, and they found it of the greatest advantage in the retreat from Moscow. The soldier, wearied with long marches and uncertain rest, obtaining his food how and when he can, with his nervous system always in a state of tension from the dangers and excitement he encounters, finds that his cigars or pipe enable him to sustain hunger or fatigue with comparative equanimity. Explain it as we may, this is physiologically true; and medical officers, who would not be sorry to see the issue of a "spirit ration" discontinued, are compelled to allow that the moderate use of tobacco by soldiers in the field has several advantages. For the wounded it is probable that tobacco has slight anodyne and narcotic properties, that enable the sufferer to sustain pain better during the day and obtain sleep during the night.

Alexander Pope.

Pope died in 1744, and the century and a quarter which has elapsed since his death has been marked by stupendous changes, not alone in the political world, but also in the world of literature. Between the men of Queen Anne's age and the men of the Victorian era there is little in common beyond the passions and aspirations which belong to human nature and are alike in all ages. We stand, as it were, in a new world, with higher aims probably, certainly with stronger feelings, with wider knowledge, and urged on by an intellectual impetus and excitement of which the earlier period knew little. The poetical revolution effected at the beginning of this century, with its marvellous wealth of thought, its deep feeling, its exquisite music, its rare perception of natural beauty, to which may be added its contempt for order, threatened by its weakness as well as by its strength to overturn the sovereignty of Pope. Byron, despite his intense admiration of Pope, whom he styled with exaggerated emphasis the "great moral poet of all times, of all climes, of all feelings, and of all stages of existence," adding that "a thousand years will roll away before such another can be hoped for in our literature," helped nevertheless, although unwittingly, to subvert the authority of his master. Scott, great in so many ways, and as generous as he was great, carried with him the taste of the nation into a region Pope had never entered; and Wordsworth, far less popular than either, but destined as a poet to exert a wider influence, was not satisfied to think lightly of poetry with which he had no sympathy, but vigorously attacked the poet. Yet Wordsworth might have learned at least one serviceable lesson from Pope, for a careful study of his verse would have shown him that the noblest poetical conceptions, unless clothed in perfect literary form, take slighter hold upon

the mind than inferior conceptions "blest in the lovely marriage of pure words." Wordsworth did often excel in form as well as in substance, and he then attained supreme excellence; but he often failed, and set his precious jewels in pinchbeck. That such a poet should entertain a comparatively mean opinion of Pope is not surprising. Wordsworth had no wit, and wit is the predominant element in Pope. Wordsworth deals with the great verities of life, Pope with the conventional moralities of society; Wordsworth lived in the eye of Nature, Pope in the eye of men; Wordsworth was a greater poet than artist, Pope, a first-rate artist, never rises to a place in the first rank of poets; Wordsworth, self-contained and self-sufficient, maintained his poetical faith heedless of opposition, Pope had no faith other than that accepted by his age. It would seem as if many influences had been at work during this century tending to diminish very sensibly the fame of Pope, yet there are reasons for believing that it has grown in spite of them. Within the last few years more attention has been given to Pope than for at least half a century.

Under-current in the Mediterranean.

It has long been known that a current is constantly flowing into the Mediterranean from the Black Sea and from the Atlantic, besides the numerous rivers pouring in always abundantly, and the question has often been asked: How is it that the great Midland Sea does not become over-full? The answer is: Because, while a surface-stream flows in through the Strait of Gibraltar, a stream deep down is constantly flowing out; and the existence of this under-current is said to have been proved by a captain who sunk a basket of stones, by a rope, to a considerable depth, where, being acted upon by the strong stream, it towed the boat out against the surface-current. Nevertheless, the existence of the under-current has been often questioned. Dr. Carpenter, however, who has recently returned from a dredging-cruise in the Mediterranean, states that he took much pains to investigate this question, and that in a short time he will publish an account of the operations by which he ascertained that the outflowing under-current does really exist.

A Valuable Library.

A library, containing many rare books, was removed from Paris just before the beginning of the siege, and was sold lately, in London, at auction. The following are some of the prices brought by the books: Guarini, *Il Pastor Fido*, on vellum, 1732, 19*l.*; *Horas de Nuestra Señora*, Paris, 1502, 20*l.* 10*s.*; *Joan Baptista de la Orden de S. Francisco*, *Adventencias para los Confessores de los Naturales* (en Español et en Mexicain), Mexico, 1600, 20*l.*; *Apocalypsis cum Figuris*, a manuscript on vellum, of the fourteenth century, from the "Abbaye de Cîteaux Bourgogne," a fine specimen of early French art. 167*l.*; *Biblia Bohemica*, black-letter, the first edition for the use of the Hussites, 1506, 2*l.* 10*s.*; *Bible en François*, Paris, par A. Benvenere, 1533, 30*l.*; *Boccaccio* (J.), *Decamerone*, in German, printed at Ulm, about 1471, 5*l.*; *Galleria de Firenze*, large paper, 31*l.* 10*s.*; *Galleria de Torino*, large paper, 20*l.* 10*s.*; *Officium Beate Mariæ Virginis*, manuscript on vellum, of the fifteenth century, an interesting specimen of Bolognese art. 5*l.*; *Thomas à Kempis*, *Gerson de l'Imitation de Jésus-Christ*, printed on vellum, 30*l.*; *Richel* (Dionisio), *Compendio Breve que Tracta*, etc., Mexico, 1544, believed to be the second book printed in America, 41*l.* 10*s.*; *Passion Christi* aus den vier Evangelisten, first edition, Strasbourg,

1506, 30*l.*; *Psalterium cum Commentariis*, manuscript on vellum, from the library of St. Lambert, at Liège, of the eleventh or twelfth century, 42*l.* 10*s.*; *Speculum Humanæ Salvationis*, manuscript on vellum, written about the latter part of the fourteenth century, 46*l.*; *Lacantii Opera*, first edition, the first book printed in Italy with a date, in Monasterio Sublacensi, 1465, 230*l.* The total proceeds of the sale were 1,984*l.* 19*s.*, a sum which shows that the war has not affected the prices of books and manuscripts in London.

Tiberius.

Few reputations have profited more largely than that of the Emperor Tiberius by the general revision of historical judgments which has been going on ever since history has been elevated by modern criticism to the rank of a science. The cause of the especial infamy under which Tiberius has labored is easily discovered. The crimes and vices imputed to him were imposing and picturesque, exciting the imagination by their enormity, and stimulating curiosity by the mystery that enshrouded them. His virtues, those of a just and sagacious administrator, were not likely to attract the attention of the historian so long as his task was limited by his own conception of it to a record of the court, the camp, and the senate. The bright side of Tiberius's character was, therefore, practically non-existent, and the rigorous estimate of a monarch according to his fulfilment of his public duties, which has destroyed so many splendid reputations, proved highly favorable to him. There are, however, few more conspicuous instances of the invariable tendency of reactions to run into extremes than the recent endeavors to elevate the sullen recluse of Capree into something of a saint, and very much of a martyr.

Varieties.

IN the new English edition of Charles Lamb's writings is a funny anecdote of Wordsworth. The person with whom the Lambs boarded, at Enfield, charged one shilling extra when they had a friend at dinner; but when Wordsworth was the guest, he charged one-and-sixpence. Lamb remonstrated, saying, "He's a great poet." "Don't know about the great poet," replied the practical landlord, "but he is a great eater."

According to a French statistician, taking the mean of many accounts, a man fifty years of age has slept 6,000 days, worked 6,500 days, walked 800 days, amused himself 4,600 days, was eating 2,500 days, was sick 500 days, etc. He ate 9,000 pounds of bread, 16,000 pounds of meat, 4,000 pounds of vegetables, eggs, and fish, and drank 7,000 gallons. This would make a respectable lake of 800 feet surface and three feet deep.

The damage done to the picture-gallery at Strasbourg, by Prussian shot and shell, amounts to a quarter of a million of francs; the loss of the library, with its manuscripts and many precious volumes, is inestimable and irreparable. The burned contents of the picture-gallery are estimated at nearly half a million of francs. The cost of repairing the cathedral is one and a half million of francs.

Two San-Francisco barbers, engaged to fight a duel, agreed to start and walk around a block, and, when they got within sight of each other, to blaze away. When they turned the corner out of sight, both started on a run in different directions, and one has sent from Alaska for his winter clothes, and the other has written to his wife from the city of Mexico, asking her to send his linen coat and palm-leaf hat.

From a careful examination of our contemporaries we find that at the present time Mlle. Nilsson has bestowed her heart and hand upon no less than five gentlemen, viz., first, Duc de

Massa; second, Gustave Doré; third, a young Russian count, "very rich and very deaf;" fourth, a "wealthy London banker;" fifth, M. Rousseau, "a French gentleman of moderate fortune."

California records, for 1870, will include three memorial industrial events—the shipment of the first bale of home-raised silk; the raising of the first successful crop of cotton, leading to the planting of several large tracts of that staple, and the first success in the manufacture of beet-sugar.

A shoemaker was fitting a customer with a pair of boots, when the buyer observed that he had but one objection to them, which was that the soles were a little too thick. "If that is all," replied the shoemaker, "put on the boots, and the objection will gradually wear away."

Captain Eyre, of the British steamship Bombay, who was punished, for sinking the United States steamship *Oncida*, by "suspension for six months," has been notified, now that his "sentence" has expired, that his former employers do not want him any more.

A board of bank-directors in London have just promulgated a decree that any clerk in their service who presumes to marry while receiving from them less than one hundred and fifty pounds a year, will be "considered to have resigned his appointment."

A gentleman writes to the London papers to state that he gets rid of organ-grinders by walking up to them, muttering a mysterious "Abracadabra," and fascinating them with a fixed glance, which they suppose to be "the evil eye."

The Spanish Cortes has voted that General Prim "deserved well of his country," that his name shall be inscribed in the Hall of the Cortes, and that the state will provide for his wife and children.

The London *Times* is reaping a harvest from the personal cards which the French refugees in London address to their friends in Paris, and thus communicate their condition and wishes.

Knott and Shott fought a duel. The result was that they changed conditions. Knott was shot, and Shott was not. It was better to be Shott than Knott.

An old bachelor says: "It is all nonsense to pretend that love is blind. I never yet knew a man in love that did not see twice as much in his sweetheart as I could."

A London butcher has been detected in selling donkey-meat for beef, and his cockney customers are exceedingly indignant at being "treated as if they were cannibals."

No less than six authors, in London, are said to have completed Dickens's "Edwin Drood," according to their own, but not to the public's, liking.

"Equality means," says a French writer, "a desire to be equal to your superiors, and superior to your equals."

The cold weather in the South has killed thousands of orange-trees in Florida and Georgia.

Von Moltke's chair, at his hotel in Berlin, is kept crowned with a laurel-wreath, and no one is allowed to sit in it.

The London directory, for the current year, fills twenty-eight hundred and sixty pages.

Why are Cashmere shawls like deaf people? Because you can't make them *here*.

English shillings have been coined for three hundred and sixty-four years.

There are seven female sculptors from America, studying in Rome.

A "Lothair knife-cleaner" can be bought in London.

The Museum.

BUDDHISM was introduced into Japan from China, through Corea, in the sixth

century of our era. It was persecuted for a long while, but gradually found favor, and is now the religion of the majority of the Japanese. Its temples are very numerous, and are crowded, not only on holy-days, but regular and frequent sermons by day and in the evening are attended by attentive congregations. These sacred edifices are sometimes very large and imposing, and always occupy commanding sites, surrounded by scenes of natural beauty. They are generally built of wood, often of cedar, and the interiors contain quaintly-carved and ornamented shrines, on which are placed a variety of images, varying in size from a child's doll to a colossus like that called the Daibutz, near Yokohama, which is a magnificent bronze statue, representing Buddha seated, of excel-

Interior of a Buddhist Temple in Japan.

lent workmanship and admirable art, fifty feet in height, and ninety-six feet in circumference at the base.

The interior, represented in the accompanying illustration, is of moderate dimensions, and represents a shrine with a group of worshippers, performing a ceremony which foreigners call the baptism of Buddha, but of whose real significance we are as yet ignorant.

Besides Buddhism, there are many religions in Japan. The oldest, which is still the state religion, is Shintoism, the chief feature of which is the worship of the sun, of the elements, and of the spirits of deified heroes. By this sect, the *mikado*, or emperor, is regarded as an incarnate deity. The best-educated and most intelligent of the people are followers of Confucius, the Socrates of China.

MEN'S FURNISHING.

[“RALPH THE HEIR,” SUPPLEMENT NO. XVI.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF FEBRUARY 4.]

CHAPTER XLIV.

THE PETITION.

THE time for hearing the petition at Percycross had at length come, and the judge had gone down to that ancient borough. The day fixed was Monday, the 27th, and Parliament had then been sitting for three weeks. Mr. Griffenbottom had been as constant in his place as though there had been no sword hanging over his head; but Sir Thomas had not as yet even taken the oaths. He had made up his mind that he would not even enter the House while this bar against him as a legislator existed, and he had not as yet even been seen in the lobby. His daughters, his colleague, Mr. Trigger, and Stemm, had all expostulated with him on the subject, assuring him that he should treat the petition with the greatest contempt, at any rate till it should have proved itself by its success to be a matter not contemptible; but to these counsellors he gave no ear, and when he went down to give his evidence before the judge at Percycross, his seat had as yet availed him nothing.

Mr. Griffenbottom had declared that he would not pay a shilling toward the expense of the petition, maintaining that his own seat was safe, and that any peril incurred had been so incurred simply on behalf of Sir Thomas. Nothing, according to Mr. Griffenbottom's views, could be more unjust than to expect that he should take any part in the matter. Trigger, too, had endeavored to impress this upon Sir Thomas more than once or twice. But this had been all in vain; and Sir Thomas, acting under the advice of his own attorney, had at last compelled Mr. Griffenbottom to take his share in the matter. Mr. Griffenbottom did not scruple to say that he was very ill-used, and to hint that any unfair practices which might possibly have prevailed during the last election at Percycross, had all been adopted on behalf of Sir Thomas, and in conformity with Sir Thomas's views. It will, therefore, be understood that the two members did not go down to the borough in the best humor with each other. Mr. Trigger still nominally acted for both; but it had been almost avowed that Sir Thomas was to be treated as a Jonah, if by such treatment any salvation might be had for the ship of which Griffenbottom was to be regarded as the captain.

Mr. Westmacott was also in Percycross—and so was Moggs, reinstated in his old room at the Cordwainers' Arms. Moggs had not

been summoned, nor was his presence there required for any purpose immediately connected with the inquiry to be made; but Purity and the Rights of Labor may always be advocated; and when better than at a moment in which the impurity of a borough is about to be made the subject of public condemnation? And Moggs, moreover, had now ranking in his bosom a second cause of enmity against the Tories of the borough. Since the election he had learned that his rival, Ralph Newton, was in some way connected with the sitting member, Sir Thomas, and he laid upon Sir Thomas's back the weight of his full displeasure in reference to the proposed marriage with Polly Neeft. He had heard that Polly had raised some difficulty—had, indeed, rejected her aristocratic suitor, and was therefore not without hope; but he had been positively assured by Neeft himself that the match would be made, and was consequently armed with a double purpose in his desire to drive Sir Thomas ignominiously out of Percycross.

Sir Thomas had had more than one interview with Sergeant Burnaby and little Mr. Joram, than whom two more astute barristers in such matters were not to be found at that time practising—though perhaps at that time the astuteness of the sergeant was on the wane; while that of Jacky Joram, as he was familiarly called, was daily rising in repute. Sir Thomas himself, barrister and senior to these two gentlemen, had endeavored to hold his own with them, and to impress on them the conviction that he had nothing to conceal; that he had personally endeavored, as best he knew how, to avoid corruption, and that if there had been corruption on the part of his own agents, he was himself ready to be a party in proclaiming it. But he found himself to be absolutely ignored and put out of court by his own counsel. They were gentlemen with whom professionally he had had no intercourse, as he had practised at the Chancery, and they at the common-law bar. But he had been solicitor-general, and was a bencher of his inn, whereas Sergeant Burnaby was only a sergeant, and Jacky Joram still wore a stuff gown. Nevertheless, he found himself to be “nowhere” in discussing with them the circumstances of the election. Even Joram, whom he seemed to remember having seen only the other day as an ugly, shame-faced boy about the courts, treated him, not exactly with indignity, but with patronizing good-nature, listening with an air of half-attention to what he said, and then not taking the slightest heed of a word of it. Who does

not know this transparent pretence of courtesies, which of all discourtesies is the most offensive? “Ah, just so, Sir Thomas, just so. And now, Mr. Trigger, I suppose Mr. Puffer's account hasn't yet been settled.” Any word from Mr. Trigger was of infinitely greater value with Mr. Joram than all Sir Thomas's protestations. Sir Thomas could not keep himself from remembering that Jacky Joram's father was a cheesemonger at Gloucester, who had married the widow of a Jew with a little money. Twenty times Sir Thomas made up his mind to retire from the business altogether; but he always found himself unable to do so. When he mentioned the idea, Griffenbottom flung up his hands in dismay at such treachery on the part of an ally—such treachery and such cowardice! What—had not he, Sir Thomas, forced him, Griffenbottom, into all this ruinous expenditure? And now to talk of throwing up the sponge! It was in vain that Sir Thomas explained that he had forced nobody into it. It was manifestly the case that he had refused to go on with it by himself, and on this Mr. Griffenbottom and Mr. Trigger insisted so often and with so much strength that Sir Thomas felt himself compelled to stand to his guns, bad as he believed those guns to be.

If Sir Thomas meant to retreat, why had he not retreated when a proposition to that effect was made to him at his own chambers? Of all the weak, vacillating, ill-conditioned men that Mr. Griffenbottom had ever been concerned with, Sir Thomas Underwood was the weakest, most vacillating, and most ill-conditioned. To have to sit in the same boat with such a man was the greatest misfortune that had ever befallen Mr. Griffenbottom in public life. Mr. Griffenbottom did not exactly say these hard things in the hearing of Sir Thomas, but he so said them that they became the common property of the Dorams, Triggers, Spiveycombs, and Spicers; and were repeated piecemeal to the unhappy second member.

He had secured for himself a separate sitting-room at the “Percy Standard,” thinking that thus he would have the advantage of being alone; but every one connected with his party came in and out of his room as though it had been specially selected as a chamber for public purposes. Even Griffenbottom came into it to have interviews there with Trigger, although at the moment Griffenbottom and Sir Thomas were not considered to be on speaking terms. Griffenbottom in these matters seemed to have the hide of a rhinoceros. He had chosen to quarrel with

Sir Thomas. He had declared that he would not speak to a colleague whose Parliamentary ideas and habits were so repulsive to him. He had said quite aloud that Trigger had never made a greater mistake in his life than in bringing Sir Thomas to the borough, and that, let the petition go as it would, Sir Thomas should never be returned for the borough again. He had spoken all these things, almost in the hearing of Sir Thomas. And yet he would come to Sir Thomas's private room, and sit there half the morning with a cigar in his mouth! Mr. Pile would come in, and make most unpleasant speeches. Mr. Spicer called continually, with his own ideas about the borough. The thing could be still saved if enough money were spent. If Mr. Givantake were properly handled, and Mr. O'Blather duly provided for, the two witnesses upon whom the thing really hung would not be found in Percycross when called upon to-morrow. That was Mr. Spicer's idea; and he was very eager to communicate it to Sergeant Burnaby. Trigger, in his energy, told Mr. Spicer to go and be —. All this occurred in Sir Thomas's private room. And then Mr. Pabsby was there constantly, till he at last was turned out by Trigger. In his agony, Sir Thomas asked for another sitting-room, but was informed that the house was full. The room intended for the two members was occupied by Griffenbottom; but nobody ever suggested that the party might meet there when Sir Thomas's vain request was made for further accommodation. Griffenbottom went on with his cigar, and Mr. Pile sat picking his teeth before the fire, and making unpleasant little speeches.

The judge, who had hurried into Percycross from another town, and who opened the commission on the Monday evening, did not really begin his work till the Tuesday morning. Jacky Joram had declared that the inquiry would last three days, he having pledged himself to be at another town early on the following Friday. Sergeant Burnaby, whose future services were not in such immediate demand, was of opinion that they would not get out of Percycross till Saturday night. Judge Crumby, who was to try the case, and who had been trying similar cases ever since Christmas, was not due at his next town till the Monday; but it was understood by everybody that he intended if possible to spend his Saturday and Sunday in the bosom of his family. Trigger, however, had magnificent ideas. "I believe we shall carry them into the middle of next week," he said, "if they choose to go on with it." Trigger thoroughly enjoyed the petition; and even Griffenbottom, who was no longer troubled by gout, and was not now obliged to walk about the borough, did not seem to dislike it. But to poor Sir Thomas it was indeed a purgatory.

The sitting members were of course accused, both as regarded themselves and their agents, of every crime known in electioneering tactics. Votes had been personated. Votes had been bought. Votes had been obtained by undue influence on the part of masters and landlords, and there had been treat-

ing of the most pernicious and corrupt description. As to the personating of votes, that, according to Mr. Trigger, had been merely introduced as a pleasant commencing fiction common in parliamentary petitions. There had been nothing of the kind, and nobody supposed that there had, and it did not signify. Of undue influence—what purists choose to call undue influence—there had of course been plenty. It was not likely that masters paying thousands a year in wages were going to let these men vote against themselves. But this influence was so much a matter of course that it could not be proved to the injury of the sitting members. Such at least was Mr. Trigger's opinion. Mr. Spicer might have been a little imprudent with his men; but no case could be brought up in which a man had been injured. Undue influence at Percycross was—"ganmon." So said Mr. Trigger, and Jacky Joram agreed with Mr. Trigger. Sergeant Burnaby rubbed his hands, and would give no opinion till he had heard the evidence. That votes had been bought during the day of the election there was no doubt on earth. On this matter great secrecy prevailed, and Sir Thomas could not get a word spoken in his own hearing. It was admitted, however, that votes had been bought. There were a dozen men, perhaps more than a dozen, who would prove that one Glump had paid them ten shillings a piece between one and two on the day of the election. There was a general belief that perhaps over a hundred had been bought at that rate. But Trigger was ready to swear that he did not know whence Glump had got the money, and Glump himself was—nobody knew where Glump was, but strange whispers respecting Glump were floating about the borough. Trigger was disposed to believe that they, on their side, could prove that Glump had really been employed by Westmacott's people to vitiate the election. He was quite sure that nothing could connect Glump with him as an agent on behalf of Griffenbottom and Underwood. So Mr. Trigger asserted with the greatest confidence; but what was in the bottom of Mr. Trigger's mind on this subject no one pretended to know. As for Glump himself, he was a man who would certainly take payment from anybody for any dirty work. It was the general impression through the borough that Glump had on this occasion been hired by Trigger, and Trigger certainly enjoyed the prestige which was thus conferred upon him.

As to the treating—there could be no doubt about that. There had been treating. The idea of conducting an election at Percycross without beer seemed to be absurd to every male and female Percycrossian. Of course the publicans would open their taps and then send in their bills for beer to the electioneering agents. There was a prevailing feeling that any interference with so ancient a practice was not only un-English, but unjust also; that it was beyond the power of Parliament to enforce any law so abominable and unnatural. Trigger was of opinion that though there had been a great deal of beer, no attempt would be made to prove that votes

had been influenced by treating. There had been beer on both sides, and Trigger hoped sincerely that there might always be beer on both sides as long as Percycross was a borough.

Sir Thomas found that his chance of success was now spoken of in a tone very different from that which had been used when the matter was discussed in his own chamber. He had been then told that it was hardly possible that he should keep his seat—and he had in fact been asked to resign it. Though sick enough of Percycross, this he would not do in the manner then proposed to him. Now he was encouraged in the fight—but the encouragement was of a nature which gave him no hope, which robbed him even of the wish to have a hope. It was all dirt from beginning to end. Whatever might be the verdict of the judge—from the judge the verdict was now to come—he should still believe that nothing short of absolute disfranchisement would meet the merits of the case.

The accusation with regard to the personation of votes was abandoned—Sergeant Burnaby expressing the most extreme disgust that any such charge should have been made without foundation—although he himself at the borough which he had last left had brought forward the same charge on behalf of his then clients, and had abandoned it in the same way. Then the whole of the remaining hours of the Tuesday and half the Wednesday were passed in showing that Messrs. Spicer, Spiveycomb, and Roodiland had forced their own men to vote blue. Mr. Spicer had dismissed one man and Mr. Spiveycomb two men; but both these gentlemen swore that the men dismissed were not worth their salt, and had been sent adrift upon the world by no means on account of their politics. True: they had all voted for Mogges; but then they had done that simply to spite their late master. On the middle of Wednesday, when the matter of intimidation had been completed—the result still lying in the bosom of Baron Crumby—Mr. Trigger thought that things were looking up. That was the report which he brought to Mr. Griffenbottom, who was smoking his mid-day cigar in Sir Thomas's arm-chair, while Sir Thomas was endeavoring to master the first book of Lord Verulam's later treatise "*De dignitate scientiarum*," seated in a cane-bottomed chair in a very small bedroom up-stairs.

By consent the question of treating came next. Heaven and earth were being moved to find Glump. When the proposition was made that the treating should come before the bribery, Trigger stated in court that he was himself doing his very best to find the man. There might yet be a hope, though, alas! the hope was becoming slighter every hour. His own idea was that Glump had been sent away to Holland by—well, he did not care to name the parties by whom he believed that Glump had been expatriated. However, there might be a chance. The counsel on the other side remarked that there might, indeed, be a chance. Baron Crumby expressed a hope that Mr. Glump might make his appearance—

for the sake of the borough, which might otherwise fare badly; and then the great beer question was discussed for two entire days.

There was no doubt about the beer. Trigger, who was examined after some half-score of publicans, said openly that thirsty Conservative souls had been allowed to slake their drought on the joint expense of the Conservative party in the borough—as thirsty Liberal souls had been encouraged to do on the other side. When reminded that any malpractice in that direction on the part of a beaten candidate could not affect the status of the elected members, he replied that all the beer consumed in Percycross during the election had not, to the best of his belief, affected a vote. The Percycrossians were not men to vote this way or that because of beer! He would not believe it even in regard to a Liberal Percycrossian. It might be so in other boroughs, but of other boroughs he knew absolutely nothing. Who paid for the beer? Mr. Trigger at once acknowledged that it was paid for out of the general funds provided for the election. Who provided those funds? There was not a small amount of fencing on this point, during the course of which Mr. Joram snapped very sharply and very frequently at the counsel on the other side—hoping thereby somewhat to change the issue. But at last there came out these two facts, that there was a general fund, to which all Conservatives might subscribe, and that the only known subscribers to this fund were Mr. Griffenbottom, Sir Thomas Underwood, and old Mr. Pile, who had given a ten-pound note—apparently with the view of proving that there was a fund. It was agreed on all hands that treating had been substantiated; but it was remarked by some that Baron Crumbie had not been hard upon treating in other boroughs. After all, the result would depend upon what the baron thought about Mr. Glump. It might be that he would recommend further inquiry, under a special commission, into the practices of the borough, because of the Glump iniquities, and that he should, nevertheless, leave the seats to the sitting members. That seemed to be Mr. Trigger's belief on the evening of the Thursday, as he took his brandy-and-water in Sir Thomas's private sitting-room.

There is nothing in the world so brisk as the ways and manners of lawyers when in any great case they come to that portion of it which they know to be the real bone of the limb and kernel of the nut. The doctor is very brisk when, after a dozen moderately dyspeptic patients, he comes on some unfortunate gentleman whose gastric apparatus is gone altogether. The parson is very brisk when he reaches the minatory clause in his sermon. The minister is very brisk when he asks the House for a vote, telling his hoped-for followers that the point is essential to his government. The horse-dealer is very brisk when, after four or five indifferent lots, he bids his man bring out from the stable the last thorough-bred that he bought, and the best that he ever put his eye on. But the briskness of none of these is equal to the

briskness of the barrister who has just got into his hands for cross-examination him whom we may call the centre witness of a great case. He plumes himself like a bullfinch going to sing. He spreads himself like a peacock on a lawn. He perks himself like a sparrow on a paling. He crows amid his attorneys and all the satellites of the court like a cock among his hens. He puts his hands this way and that, settling even the sunbeams as they enter, lest a mote should disturb his intellect or dull the edge of his subtlety. There is a modesty in his eye, a quiescence in his lips, a repose in his limbs, under which lie half-concealed—not at all concealed from those who have often watched him at his work—the glance, the tone, the spring, which are to tear that unfortunate witness into pieces, without infringing any one of those conventional rules which have been laid down for the guidance of successful, well-mannered barristers.

Sergeant Burnaby, though astute, was not specially brisk by nature; but on this Friday morning Mr. Joram was very brisk indeed. There was a certain Mr. Cavity, who had acted as agent for Westmacott, and who—if anybody on the Westmacott side had been so guilty—had been guilty in the matter of Glump's absence. Perhaps we should not do justice to Mr. Joram's acuteness were we to imagine him as believing that Glump was absent under other influence than that used on behalf of the Conservative side; but there were other points on which Mr. Cavity might be made to tell tales. Of course, there had been extensive bribery for years past in Percycross on the Liberal as well as on the Conservative side, and Mr. Joram thought that he could make Mr. Cavity tell a tale. And then, too, he could be very brisk in that affair of Glump. He was pretty nearly sure that Mr. Glump could not be connected by evidence with either of the sitting members or with any of their agents. He would prove that Glump was neutral ground, and that as such his services could not be traced to his friend Mr. Trigger. Mr. Joram on this occasion was very brisk indeed.

A score of men were brought up, ignorant, half-dumb, heavy-browed men, all dressed in the amphibious garb of out-o'-door town laborers—of whom there exists a class of hybrids between the rural laborer and the artisan—each one of whom acknowledged that after noon on the election-day he received ten shillings, with instructions to vote for Griffenbottom and Underwood. And they did vote for Griffenbottom and Underwood. At all elections in Percycross they had, as they now openly acknowledged, waited till about the same hour on the day of election, and then somebody had bought their votes for somebody. On this occasion the purchase had been made by Mr. Glump. There was a small empty house up a little alley in the town, to which there was a back door opening on a vacant space in the town known as Grinder's Green. They entered this house by one door, leaving it by the other, and as they passed through, Glump gave to each man

half a sovereign with instructions, entering their names in a small book—and then they went in a body and voted for Griffenbottom and Underwood. Each of the twenty knew nearly all the other twenty, but none of them knew any other men who had been paid by Glump. Of course, none of them had the slightest knowledge of Glump's present abode. It was proved that at the last election Glump had acted for the Liberals; but it was also proved that at the election before he had been active in bribing for the Conservatives. Very many things were proved—if a thing be proved when supported by testimony on oath. Trigger proved that twenty votes alone could have been of no service, and would not certainly have been purchased in a manner so detrimental. According to Trigger's views it was as clear as daylight that Glump had not been paid by them. When asked whether he would cause Mr. Glump to be repaid that sum of ten pounds, should Mr. Glump send in any bill to that effect, he simply stated that Mr. Glump would certainly send no such bill to him. He was then asked whether it might not be possible that the money should be repaid by Messrs. Griffenbottom and Underwood through his hands, reaching Glump again by means of a further middleman. Mr. Trigger acknowledged that were such a claim made upon him by any known agent of his party, he would endeavor to pass the ten pounds through the accounts, as he thought that there should be a certain feeling of honor in these things; but he did not for a moment think that any one acting with him would have dealings with Glump. On the Saturday morning, when the case was still going on, to the great detriment of Baron Crumbie's domestic happiness, Glump had not yet been caught. It seemed that the man had no wife, no relative, no friend. The woman at whose house he lodged declared that he often went and came after this fashion. The respect with which Glump's name was mentioned, as his persistency in disobeying the law and his capability for intrigue were thus proved, was so great, that it was a pity he could not have been there to enjoy it. For the hour he was a great man in Percycross—and the greater because Baron Crumbie did not cease to threaten him with terrible penalties.

Much other bribery was alleged, but none other was distinctly brought home to the agents of the sitting members. As to bringing bribery home to Mr. Griffenbottom himself—that appeared to be out of the question. Nobody seemed even to wish to do that. The judge, as it appeared, did not contemplate any result so grave and terrible as that. There was a band of freemen of whom it was proved that they had all been treated with most excessive liberality by the corporation of the town; and it was proved, also, that a majority of the corporation were supporters of Mr. Griffenbottom. A large number of votes had been so secured. Such, at least, was the charge made by the petitioners. But this allegation Jacky Joram laughed to scorn. The corporation, of course, used the charities

and privileges of the town as they thought right; and the men voted—as they thought right. The only cases of bribery absolutely proved were those manipulated by Glump, and nothing had been adduced clearly connecting Glump and the Griffenbottomites. Mr. Trigger was in ecstasies; but Mr. Joram somewhat repressed him by referring to these oracular words which had fallen from the baron in respect to the corporation. "A corporation may be guilty as well as an individual," the baron had said. Jacky Joram had been very eager in assenting to the baron, but in asserting at the same time that the bribery must be proved.

"It won't be assumed, my lord, that a corporation has bribed because it has political sympathies."

"It should have none," said the baron.

"Human nature is human nature, my lord—even in corporations," said Jacky Joram.

This took place just before luncheon—which was made a solemn meal on all sides, as the judge had declared his intention of sitting till midnight, if necessary.

Immediately after the solemn meal Mr. Griffenbottom was examined. It had been the declared purpose of the other side to turn Mr. Griffenbottom inside out. Mr. Griffenbottom and his conduct had on various former occasions been the subject of parliamentary petitions under the old form; but on such occasions the chief delinquent himself was never examined. Now Mr. Griffenbottom would be made to tell all that he knew, not only of his present, but of his past, iniquities. And yet Mr. Griffenbottom told very little; and it certainly did seem to the by-standers, that even the opposing counsel, even the judge on the bench, abstained from their prey because he was a member of Parliament. It was notorious to all the world that Griffenbottom had debased the borough; had so used its venal tendencies as to make that systematic which had before been too frequent indeed, but yet not systematized; that he had trained the rising generation of Percycross politicians to believe in political corruption—and yet he es-

caped that utter turning inside out of which men had spoken.

The borough had cost him a great deal of money certainly; but, as far as he knew, the money had been spent legally. It had at least always been his intention before an election was commenced that nothing illegal should be done. He had no doubt always afterward paid sums of money, the use of which he did not quite understand, and as to some of which he could not but fear that it had been doubtfully applied. The final accounts as to the last election had not reached him, but he did not expect to be charged with improper expenses. There no doubt would be something for beer, but that was unavoidable. As to Mr. Glump, he knew literally nothing of the man—nor had he wanted any such man's assistance. Twenty votes indeed! Let them look at his place upon the poll. There had been a time in the day when twenty votes this way or that might be necessary to Sir Thomas. He had been told that it was so. On the day of the election his own position on the poll had been so certain to him, that he should not have cared—that is, for himself—had he heard that Glump was buying votes against him. He considered it to be quite out of the question that Glump should have bought votes for him—with any purpose of serving him. And so Mr. Griffenbottom escaped from the adverse counsel and from the judge.

There was very little in the examination of Sir Thomas Underwood to interest any one. No one really suspected him of corrupt practices. In all such cases the singular part of the matter is that everybody, those who are concerned and those who are not concerned, really know the whole truth which is to be investigated; and yet, that which everybody knows cannot be substantiated. There were not five men in court who were not certain that Griffenbottom was corrupt, and that Sir Thomas was not; that the borough was rotten as a six-months-old egg; that Glump had acted under one of Trigger's aides-de-camp; that intimidation was the law of the borough; and that beer was used so that men drunk might not fear that which sober they had not

the courage to encounter. All this was known to everybody; and yet, up to the last, it was thought by many in Percycross that corruption, acknowledged, transparent, egregious corruption, would prevail even in the presence of a judge. Mr. Trigger believed it to the last.

But it was not so thought by the Jacky Jorams or by the Sergeant Burnabys. They made their final speeches—the leading lawyer on each side, but they knew well what was coming. At half-past seven, for so to late an hour had the work been continued, the judge retired to get a cup of tea, and returned at eight to give his award. It was as follows:

As to the personation of votes, there should have been no allegation made. In regard to the charge of intimidation, it appeared that the system prevailed to such an extent as to make it clear to him that Percycross was unfit to return representatives to Parliament. In the matter of treating, he was not quite prepared to say that, had no other charge been made, he should have declared this election void; but of that also there had been sufficient to make him feel it to be his duty to recommend to the Speaker of the House of Commons that further inquiry should be made as to the practices of the borough. And as to direct bribery, though he was not prepared to say that he could connect the agents of the members with what had been done—and certainly he could not connect either of the two members themselves—still, quite enough had been proved to make it imperative upon him to declare the election void. This he should do in his report to the Speaker, and should also advise that a commission be held with the view of ascertaining whether the privilege of returning members of Parliament should remain with the borough. With Griffenbottom he dealt as tenderly as he did with Sir Thomas, sending them both forth to the world, unseated indeed, but as innocent, injured men.

There was a night-train up to London at ten P. M., by which on that evening Sir Thomas Underwood travelled, shaking off from his feet as he entered the carriage the dust of that most iniquitous borough

PICTURESQUE AMERICA.—A NOOK ON THE HUDSON.

OUR VISIT TO MOUNT VERNON.

I FOUND Washington a pleasanter city than its calumniators allow, and not as pleasant as my excited fancy had conjured up. I walked its wide avenues till I was blinded with dust, and blistered, head and foot. I "did" its public buildings without flinching; turned my brains upside down in the vain attempt to study the interior of the dome of the Capitol; coaxed a pair of tight boots to the very top of the edifice; had a good look at both "Houses;" gazed my fill at Sumner, the shaggiest lion of a man I ever saw; caught a glimpse of Revels as he was walking out of the Senate-chamber; saw Butler, who looks so full of fight that it seems forever trying to ooze out on his bald and shining pate; and Banks, less happy of countenance and cheerful of tone than he was twenty years ago.

I met the President, and liked his inscrutable face; I shouldn't like it, however, if I were to call on him for any favors. It is not the style of countenance that an office-seeker might hunger after. I sauntered graciously through the Red-room, the Blue-room, and the great East-room, and felt, like any other true-born American citizen, that I was monarch of all I surveyed, till I sat down in a red-plush chair, and was politely requested by the usher to vacate my comfortable seat.

My time was limited. I had promised to be home on a certain day, if possible.

"To-night," said I, one morning at the breakfast-table, "I must be on my winding way."

My pretty hostess (all Washington hostesses are pretty, they say) looked up with an incredulous expression.

"Going to leave us without visiting Mount Vernon?" she exclaimed. "Why, nobody thinks of doing so. You must certainly see the grave of Washington."

I turned to my brother-tourist, a smooth, sedate young man, after the most elaborate and ministerial pattern.

"Can we spare one more day?" I asked.

He took three sips of coffee and another mouthful of toast while deliberating, and then replied that he thought we might venture. He didn't see as it would make the difference of more than a few hours; there might never be another chance; a boat went down every day; the sail was a pleasant one, and the fare reasonable.

"I'll put you up a nice lunch," said our pretty hostess, "and you'll never be sorry if you go, I can promise you. The grounds are lovely; and then the dear old house—I do so dote on those famous old houses—those classic shades like Mount Vernon!"

I looked at my watch; we had just thirty minutes in which to reach the boat. Could it be done?

It was done. We two, with lunch carefully packed in a very small basket, found ourselves on a wee boat called the Arrow, which was preparing to be shot off, and making a prodigious noise in the operation.

The captain was good-natured and portly—all portly men are good-natured; I am portly.

Presently we were off, passing the Arsenal, with its fine grounds and fresh greensward, and many other places exceedingly beautiful in scenery. With serene sunshine and a delicious breeze, the sail promised to be delightful, and we were nearly the only passengers for Mount Vernon.

There were two remarkable negroes on board; one of them played the banjo, the other sang a pleasing little melody, the refrain of which was:

"Oh, when I was single,
My pockets did jingle,
I wish I was single again, again."

They amused us very much, particularly as after each exhibition of their remarkable powers they handed us a hat—not of the latest fashion—into which we were expected to put something.

The first time I deposited ten cents in this unique receptacle; my friend did likewise. The second time, grown wiser, I reduced my contribution one-half; the third time I gave my only remaining penny; the fourth time I looked the man sternly in the face and dropped in a button, and he took the hint. The fifth time he didn't come.

We longed eagerly for the first glimpse of the classic shades, and were sure we caught it just fifty-five times. It was two hours before we neared the point of interest, owing to the stubbornness of the tide.

Then, at the boat's shrill whistle, we understood that, at last, we had reached the home of Washington. Our hearts beat high with enthusiasm; we were so bubbling over with delight that we forgot to ask what should be the sign of our return, but settled between ourselves that we should find out somehow. We always do find out somehow, I have noticed on other occasions.

From the boat we walked up a sort of shaded lane. The moss, in beautiful varieties of green and yellow, lined the banks. The grass was thick under our feet, and the shadows few. The road was ridgy with recent rains, but on either hand the verdant carpet of Nature, prettier every way than Brussels, or Axminster, or velvet tapestry, was starred with the brightest wild-flowers.

"Washington has walked this same path," said my companion, reverently.

"Unless it has been opened since his death," said I.

"At all events we are nearing the house and grounds. It will not require any stretch of imagination to fancy that his footsteps have hallowed them," was the reply.

A narrow, winding path presented itself. The fair estate laid mapped out before us, giving glimpses of paradisiacal openings, brightened by pretty views of the glistening Potomac.

"Here," I said, as we reached a small enclosure, "must be the grave wherein the sacred dust is laid.—Remove your hat, my friend: here the greatest and best of his kind sleeps in a few feet of common earth!"

Poetic apostrophes rose to my lips; the tears were in my eyes. I felt inclined to kneel, at least on one knee, but happily curbed the pious inclination. I say happily, for at that moment a little red-coated yellow boy, with a mouth that transgressed all the lines of beauty, sauntered idly toward us, munching a green apple.

"My little lad," asked I, conscious that often the very occupants of hallowed shades are not familiar with the whereabouts of famous localities—"my little lad, what place is this?"

"Isus," repeated he, going at the apple again.

"What does he say?" queried my companion; "it sounds like Greek."

I repeated my question, and suddenly felt like putting my face in my hat.

"Old isus," he said again, breathing hard in his efforts to answer and swallow the apple at the same time.

"Oh—ah—I see," responded my friend, "this is the old *ice-house* at which we have been doing homage;" and suddenly the classic shades echoed and reechoed with our laughter.

The little boy paused aghast, stopped munching, and looked as if he were going to run away. He hitched his small trousers, and stood on one foot like a contemplative chicken.

"My boy, where is the tomb of Washington?" I asked, as soon as I could command the gravity essential to the subject.

"Up sher, massa, take da' dar road;" and he pointed to an opposite path, and calmly finished his apple.

Another moment, and we stood by the veritable tomb. We did not need to school our exuberance now; we felt that we were gazing on the ashes of the mighty dead, and were solemn. With what power the recollection of the wonder-working events of the past came over us! We spoke in whispers. Far as the eye could reach from this eminence, Nature in her loveliest forms and colors appealed to our hearts. Here he lived, walked, talked, planned; in that little white mansion yonder he breathed his last, and was carried forth, never more to return. And here before us, in the simplicity of a republican tomb, he slept. No armed guards to protect it from sacrilege; no splendid monument to proclaim that here rested all that was mortal of the greatest man of his age—the Father of his Country.

My friend ventured to remark that it looked rubbishly round the place. It did. There were bones and fragments, and stones and litter. I suspect they don't have many servants to keep the classic shades in order.

We went to the house, were admitted, saw the Lafayette mantel-piece, the wicked-looking key of the Bastille, the old, jangling harpsichord, the queer little parlors, the quaint frescoes, the wide staircase, the sacred room in which he died—all these we carefully inspected.

While enjoying the beautiful view from the cupola, we heard a whistle.

"It can't be possible that's the signal to go?" quoth I.

"Of course not," was the reply; "we've only been here half an hour. Besides, they blow two whistles always."

I possessed my soul in patience at this, and we went on and out with our sight-seeing. We found numerous relics—at least we chose to call them so—and diligently labelled them:

A feather or two belonged to a lineal descendant of Father Washington's most venerable rooster. An antiquated oyster-shell, found in the interstices of one of the barns, might have been opened to furnish a bivalve for the great man's palate. My friend dug up a jack-knife, that appeared to have been buried a hundred years. It was at once made to do duty as George Washington's pocket-knife, the one he cut the cherry-tree with.

After I had carefully labelled it, my friend gravely suggested that I had better find a hatchet for that purpose, as it was never chronicled that the good boy used a knife on that occasion.

It was only a momentary forgetfulness on my part, so I erased all but the first line of the inscription.

We cut the bark (small pieces of it) from his favorite tree; we purloined a few flowers from his stately little garden; we dug moss from his banks; we ate our frugal lunch surrounded by some dozen hens and chickens, who fought for the crumbs; we parried the nose-thrust of an elderly goat, who had probably been petted by visitors till he had become an impertinent graybeard.

Suddenly it occurred to me that we had heard no second whistle.

Possibly the steamer might be still at the wharf. We hurried down. Nothing in sight except a crazy boat and three or four scantily-clothed colored young boys fishing. Of them we queried about the Arrow.

"Been gone two hours," said one.

"But when will the other boat be here?"

"There's no odder boat to-night, mas'r; to-morrow at four the Arrow'll be back."

We bit our lips, and looked at each other in blank consternation.

To-morrow! Indeed, to-day we should have started on our journey home. The classic shades for a moment lost all their beauty, and seemed exceedingly blank and commonplace.

"What are we to do?" asked my friend, "which 'is name is Frank," as Mrs. Brown would say.

I shook my head. We toiled back to the house. The relics began to be troublesome.

A night-black darkey sat half-asleep on the porch. We succeeded in rousing him.

"Where is the gentleman of the house?" I asked.

"Dunno, sir," was the reply. "P'raps you means Mas'r W—— in de office."

He led us to the office. "Mas'r W——" was there, with the proper official aspect, and a pen behind his ear. He appeared to be reading, but the moment he saw us his pen was in his hand, and his keen eye seemed to say:

"Contribution, sir?"

Frank was spokesman.

"Mr. W——, we are left," he said. "Not knowing the regulations of the boat, we failed to obey her signal. What shall we do?"

"Well, really," said Mr. W——, "really I don't know."

"Is there no way of getting off?"

"Only by the boat, sir."

"Are there no teams to be had?"

"Not in this place. And, I regret to say, no accommodations for travellers."

"We must get off," said Frank.

"I wish I could help you," said Mr. W——. "Ah, I might send for Uncle Ned," he exclaimed, after a reflective pause; "he has a couple of mules, but it would be useless for you to attempt to go to-night; there will be no moon, and Uncle Ned is very careful of his mules."

I wondered, even in that trying moment, if Uncle Ned was a relative of that much-sung uncle who "had no wool on the top of his head," but did not venture to put the question.

Presently Uncle Ned made his appearance—a gigantic negro, though old and bowed, with the head of a philosopher, and the eye of a hawk.

"Well, gen'lmen," he said, when I had stated the circumstances, "I ken tote ye down to-morrow airy for a 'sideration. I's got two

dretfel good beasts—they's beauties, they is, and they'll kerry you quiet."

"What will that consideration be?" asked Frank.

"Well," he said, twirling his rimless hat, and surveying his patched overcoat, "I reckon I ken do it fer ten dollars."

I suppressed an "Oh!"

Frank suppressed one, too; I could see it in his face.

Mr. W—— toyed with his pen, and his eyes twinkled. I suspect that he had been taken in himself, and rather enjoyed our being done for.

I had only five dollars with me, and Frank had but little over that sum. We had compared notes previous to starting.

"So that is your price," said I; and any one would have imagined me the possessor of a well-packed pocket-book.

"Das de price, boss," said the old man, straightening himself a little; "you see it's a long an' a hard road to trabble, an' I couldn't take two gen'lem for no less, no sort o' way, shuah."

"Very well; but where are we to stay to-night?" I asked.

"Well, das anoder qeshon, mas'r," replied the negro, with one or two awkward jerks. "Ain't no tavern anywheres hereabouts—sartin ob dat, sir."

"I don't see but we must sleep somewhere—perhaps there's a barn on the premises," said I.

Mr. W—— was busy pulling at a scant mustache. Suddenly the old negro put out one foot, stroked the side of his nose, and eyed us askance.

"Dar's Aunt Sally," he exclaimed.

"Who is Aunt Sally?"

"Mighty nice ole 'ooman, sir. She's got a cabin wid a room over-top. She'll fix ye, gen'lem."

"For a consideration, I suppose?" said Frank.

"Yes, boss," Uncle Ned rejoined, "I'll make dat all right. Won't ask ye no more, seein' yees rale gen'lems; so, if ye pleases, I'll show yo' whar Aunt Sally lives."

The old scamp knew that he had charged us five dollars too much, but was evidently charmed that we had not beat him down one-half.

In the course of an hour we were sitting in Aunt Sally's cabin, eating pone-cake. The little place was as clean and neat as hands could make it. Aunt Sally herself, high-turbanned, tall, and consequential, moved about with unsurpassed dignity. After we were better acquainted, her fat sides shook more than once at our poor jokes.

By an uncertain ladder we gained our room. It was pitch-dark, but Aunt Sally handed us a tallow-dip that enabled us to make a survey of the premises. A low, comfortable bed, spread with white, took up half the room; a little table stood by its side, topped by a ragged and well-thumbed Bible; a chair did duty as a wash-stand; and by the window we dimly perceived a bowl and pitcher.

We slept sweetly that night, anxious as we were, in our novel quarters. Aunt Sally called us up early, gave us fried bacon and corn-cake, with "lasses" in a brown cream-jug, and, at seven precisely, came Uncle Ned with his mules.

I have often thought since that the ride was worth the money, aside from Uncle Ned's entertaining conversation. The old man told us that he was eighty-nine.

"Born on de place, gen'lem," he said; "seen de ole gen'ral more times 'an you could count, I reckon. Mighty good mas'r he war, too; slaves all loved him. Ky! dey set up a howlin' when he died, I reckon. All down de place dar was lights an' fires burnin', and dem what didn't sing war cryin', an' dem as wasn't cryin' war prayin', an' 'twas jus' as 'twas when de Lord was taken, I reckon."

This the old man said with a solemn face.

The roads were very passable, some of them perfect bowers, where the trees met over our heads, spreading a net-work of quivering light beneath. Many a picture we saw on that eventful morning as Uncle Ned pointed out places made historical by the "late onpleasantness."

One ancient thatch-covered mill we passed, about which lounged several strapping negroes, each with his white bag waiting for the meal to be ground. The great beams were cool and dripping, painted with that inimitable hair-like delicacy of green and amber made by layers of almost impalpable moss; the sound of the water trickling from the wheels caused my nerves to tingle with boyish pleasure. Here and there were stretches of field and hill such as no painter's

skill could rival, and everywhere the irrepressible Virginia fence kept us company.

At last we reached Alexandria, and parted with our Uncle Edward, after transferring two crisp paper pictures to his homespun pockets.

Arrived home, we found our pretty hostess in an alarming state of mind, she having conjectured all possible mishaps, but, producing our relics, she soon relapsed into her usual state of smiling complacency, and to this day has, in a conspicuous place in her cabinet, the old jack-knife that we had labelled with so much care.

BERNARD'S INVENTION.

I.

TWELVE o'clock.

Not midnight, but bright, soft noonday—the noonday of lovely April—in the old-fashioned garden of an old-fashioned house, located in the very midst of the business portion of the large and flourishing town of W—. It had once been a very elegant residence, this old house, and had stood on the outskirts of the town, with pleasant hills and valleys, waving woods and green fields, sweeping up to the very verge of the garden. But now, all around it, flowed a busy tide of trade; warehouses of cotton and tobacco rose on either side; wagons and drays rattled past unceasingly; in the rear, a car-shop belched forth black smoke; while engines screamed, and trains rumbled heavily back and forth, at all hours of the night and day. Still, even amid these discordant surroundings, the old house held its own bravely, and, wrapping itself about with a mantle of dignified reserve, looked down with the pride of conscious antiquity upon all these new-comers of the later time. It had a right to do this, since its own recollections went back to the time when the Georges were kings, and when, at intervals, the red-men gathered strength to sweep down upon the dove-cots of their invaders. It was pointed out by the W—ites as the place where Cornwallis had established his headquarters, and where he and his courtly staff had once given a ball, and with the fair Tory ladies of the place danced a summer's night through. Life and death, and joy and sorrow, had each had its own time within its dark old walls; yet, still it stood—a memorial of the stately past, and, in some wise, a rebuke of the flippant present. It was not a pretty house, as beauty is reckoned now—nobody could for an instant compare it to the elegant villas which were scattered to the westward, and monopolized all that fair outlook of rolling country which had once been its own—neither was it a very comfortable house, according to modern ideas of comfort. But you rarely find, nowadays, such work as that of the panelled walls or richly-carved chimney-pieces, and there were nooks and corners about it, odd rooms stored away in all sorts of unaccountable places, and closets almost as large as rooms under the strange, dark, winding staircases, which gave it a charm that the most commodious and thoroughly-ventilated houses oftener lack than possess. Then, there was the back piazza, all latticed in and covered with green vines, until it had the seclusion, and more than the coolness, of a drawing-room. And beyond this piazza was the gem of the whole establishment—the old-fashioned garden, shut in from the outer world by a high wall, through which no one could peer, and over which no one could climb, occupying nearly a square, full of fruit-trees, fragrant with flowers, and abounding in shrubs that half a century before had been trimmed into the formal regularity of art, but had now overgrown every thing with the wild luxuriance of Nature.

It was in this garden that the flickering April sunlight marked twelve o'clock on a sundial that occupied the middle of a green plat, round the borders of which bright-hued flowers of the spring were blooming, while just in front of it was an arbor, draped all over with that fragrant darling of the Carolina woods, the yellow jasmine. Within this arbor—framed, as it were, by the green tendrils and golden bells—sat a young girl, busily engaged in drawing, at a small table. Seen under favorable circumstances, she might have been, and no doubt was, exceedingly pretty; but just now she looked pale and weary; her dress was careless; her hair was hastily pushed back, and gathered in a rough, loose knot behind; while her forehead was drawn into a frown that ill became its pearly whiteness. On the table before her lay open a case of mathematical-drawing instruments, and it was with these that she worked, tracing out intricate designs of an appar-

ently mechanical character on a large sheet of card-board, and now and then noting down certain numerical results on a sheet of paper near at hand. It was weary work, and when, at last, she glanced up, and saw that it was twelve o'clock, she threw down her pencil with an air of unmistakable relief.

"I must go and see about dinner," she said, half aloud; and, as she said it, she took up a large portfolio from the ground beside her chair, and began to put the drawing away. While she was thus occupied, a clear, fresh voice suddenly called, "Annie!" A quick, ringing step sounded on the gravel walk, and, round a group of shrubs that formed a perfect cloud of tinted bloom, a young man of the most frank and cheery presence imaginable came into sight. He was not particularly handsome, but he had a graceful, well-knit figure, and an open, pleasant face, while his whole manner diffused such an air of moral sunshine that it was no wonder the gloom parted and fled from the girl's brow at once.

"Louis!" she cried, eagerly; and then smiled, and added, in a tone of absurdly-weak reproof, "You provoking boy! how you startled me! What on earth brings you here at this hour of the day?"

"Kiss me, pretty one, and I'll tell you," said the new-comer, gayly. Then, having taken this favor, without incurring any rebuke thereby, he added, more gravely: "Annie, darling, congratulate me—my fortune is made! If your father agrees, we can be married this day two months."

"Oh!" said Annie, with a gasp; but the color came into her face, and made her absolutely lovely. "O Louis! how? what? Tell me what you mean—tell me all about it!"

The young man kissed her again. He was evidently glowing with triumph, and found it hard to contain his exultation within moderate bounds.

"I mean just what I say," he answered; "but, as for telling you all about it, I can't do that dearest, for I am bound to secrecy. I can only tell you this: my fortune—our fortune—is made, and you are mine."

"I was always that!" she cried, with something between a laugh and a sob. "But, surely, Louis, you can tell me a little more than this. If it is to be *our* fortune, surely, I have a right to know how it is made."

"Can't you trust me, Annie?"

"Trust you! Indeed, yes—ever and always. But, then, you know we are pledged not to keep any secrets from each other."

"Only such as honor demands; and this is a case of honor. However, I can tell you a little, the general outline of the matter. Here, let us sit down and talk at our leisure. Now—that is better. Well, to begin rather far from the point, and not so far either, you know I have always had a decided mechanical talent, and, thanks to your father's kindness, I have acquired some aptitude in turning it to account."

"Yes," said Annie, with a rueful glance at the portfolio; "yes, I know you have, and I know you will end by being as bad as he is, if you do not stop yourself in time."

"Stop myself!" repeated the young man, with a laugh. "Why, little simpleton, the science of mechanics is the lever of the world nowadays, and in all the world there is no better or more direct road to fortune than that which it opens. If we are married two months hence, it will be thanks to mechanics."

The girl's face fell a little; but she did not utter any thing, excepting the simple interrogative—

"How?"

"By means of a great invention," answered the young man, with color rising to his face, and light flashing in his eyes—"an invention which will be the greatest since steam, and which will go far to revolutionize the whole system of mechanics, as known to the world at present. I wish I could show it to you, Annie darling; I wish I could tell you.—But what is the matter? Why do you look at me as if—as if you were disappointed?"

"Because I *am* disappointed!" cried the girl; and before her lover knew what she was about, she had laid her head down on the table and was sobbing bitterly. Poor things! It was hard on both of them. Hard on the triumphant bearer of good news to see it so received. Harder still on the girl who had been so flushed with hope, to have it dashed by that word, to her, of fatal omen—"invention."

"I thought you meant something real—something to be relied

on," she sobbed. "O Louis, how could you disappoint me so cruelly! Oh, I am so sorry, so very sorry, that this fever—God knows I am almost tempted to call it this madness—has seized you, too! Louis, for Heaven's sake put it from you! Trust to the steady results of honest labor, and not to these wild schemes of a fortune to be made at one stroke. Look at my father! let him be a warning to you. See how his life has been spent in the service of this wretched science—how many inventions, that were to benefit the world, he has made—and where and how he is to-day! Oh, I had so hoped that with you I should be free from this weary toil that comes to nothing, this eager counting on dreams that are shadowy as air! And now—Louis, Louis, you will break my heart!"

"Dear love, I hope not," said Louis, half concerned, half amused. "You don't appreciate your father, Annie. You don't know what a

it is so sad! And to think that you have started on the same path!"

"I have only made a beginning, dear, and as for my being a great inventor, you may set your mind at rest on that point. Nature did not favor me with the rare gift of original conception. I can only work out other men's thoughts, and sometimes bring them to a practical issue. This is all that I have done now. A gentleman, a friend of mine—I cannot tell you his name, because he desires that it may be kept secret—conceived a new idea in mechanics, but, lacking practical knowledge of the science, he could not work it out in practical form. So he brought a rough draught of the invention to me, and told me that, if I could perfect it, I might take out the patent, and share half the profits. I saw, at once, what a magnificent thing it would be if it *could* be perfected; so I fell into the idea forthwith, and went to work.

" 'Annie, congratulate me—my fortune is made.' "

great man he is—what a great man he yet will be in the face of that world which has treated him as from the beginning it has always treated genius—has robbed him, and laughed at him, and refused to hear him! But it will hear him yet. There never was a great mind that did not have to pass through this ordeal! there never was a great discovery that was not met by this opposition; there never was a great achievement that did not have to triumph over these difficulties. It has been hard on you, my poor pet; but I hope the hardest is over at last. Apart from my good fortune, your father tells me that he is working on an invention, which he thinks the greatest he has ever made, and the patent-right of which he does not mean to put out of his own hands."

"Yes, he is working at it," said the girl, wearily, and once more she glanced at the portfolio. "I have been making out some of the drawings," she added; "but he forbade me to show them, even to you. He has been robbed so often, that he has grown very suspicious now. Sometimes, I think he is reluctant to trust even me. O Louis,

Oh, Annie, how I worked! I saw fortune and you before me, and I never drew rein night or day. But, after a while, the inventor's fever came over me, and the fascination of the science overtook me. Then I forgot all about fortune, I even forgot all about you, and worked on and on, only that I might reach the result which seemed ever before me and yet ever eluding me. It eluded me for a long time, and no one but an inventor can imagine the fever in which I lived during that time. Waking or sleeping, I thought of nothing else—saw nothing else; and when, at last, one day the solution of my difficulties came to me like a flash of inspiration, I shouted until my neighbors thought that I was mad. I wanted, then, to throw down pencil and paper and rush to you; but Mr. —, I mean the original inventor, held me bound to absolute secrecy, and he did not relax this requirement even when all the specifications were made out and forwarded to the Patent-Office. It was not until this morning, when he came and told me that the patent was finally issued, that he also told me I might announce the fact to my friends, provided I didn't divulge his name.

Heaven only knows why he should wish to give me all the credit, as well as half the profits; but one thing is certain, my darling—our fortune is made, and you are mine!"

He caught the girl in his arms at the last words, and kissed her again and again, while she could only lay her head down on his shoulder and indulge in an hysterical combination of laughter and tears.

"I am happy, Louis, and grateful—oh, so grateful!" she said, as well as the laughter and tears aforesaid would allow; "but, dear love, I should be still more happy, still more grateful, if the fortune had come to you in any other way. It seems to me like gambling—like something that means prosperity for a little while, but ruin in the end. I may be very foolish, but that is the way it seems to me, and then—O Louis, I feel sure that, in some way or other, it will bring us ill-luck!"

Louis smiled at this; but he did not attempt any thing like reason in reply. On the contrary, he changed the subject, and asked the foreboding girl if her father was at home. "I did not see him as I came through the house," he said; "and I am on thorns until I tell him my good luck, and hear him assure me that I may take you as soon as I please."

"He is not likely to give you that assurance to-day," said she, nodding archly.

"Is he not? Well, let us go and see."

They went accordingly, sauntering side by side down the garden-paths bordered with rows of tall box, and enlivened here and there by fragrant lilacs and sweet purple wisteria, until they reached the latticed piazza. From this they entered a narrow, dark passage, made still darker from the fact of the front door being closed, and thence passed into a room that resembled an amateur machine-shop more than any thing else. Mathematical and mechanical designs lined the walls; models, in miniature, of all machines, in connection with which steam has ever been used as a motive power, occupied every available space—excepting that which was filled by a large, locked cabinet—and in the midst of this apparent disorder stood a table, littered over with paper and drawing-materials. Annie looked round the apartment and shook her head.

"Papa is not here," she said. "You must remain on thorns a little longer, Louis."

"May he not be in the house somewhere?"

"No, he has gone out. Don't you see his hat is missing? He has gone to the machine-shops, I am sure. He often goes there for what he calls 'practical suggestions.' Come, let us sit in the piazza. This room is so dark and cold, that it makes me shiver."

II.

Very much like the fortunes of the old house were the fortunes of the man who at present inhabited it. He was a gentleman of good descent, as his name—the noble Scottish name of Gordon—amply testified; and he had once possessed a more than moderate amount of wealth; but, having been blessed, or rather cursed, with the gift of invention, this wealth had melted away to satisfy the insatiate demands of scientific experiment, until little or none of it remained. After his fortune was gone, he soon exhausted the long-suffering patience of his friends. They were all practical, worldly-wise people, and, regarding him as a half-mad visionary, troubled themselves very little about the manner in which they expressed this opinion. Naturally enough, Mr. Gordon resented its expression, and, naturally also, a formal break was the result. Being a widower with only one child, he took this child, and the yet dearer children of his brain—his inventions—and went forth into the world to conquer fortune. Instead of conquering, however, he was speedily conquered. Men laughed at his inventions, and then stole them; patent-rights, of his own discoveries, were taken out before his eyes; and he fell a victim to the countless modes of swindle and legal robbery that, from first to last, lie in wait for the inventor, and flch from him both the glory and the profit he has toiled to gain. After a time, he drifted to W—, and became an inmate of the rambling old house already described. Here he lived an eremite sort of existence, working with feverish energy at an invention, which was to revolutionize the whole system of mechanics, and make not one, but a dozen fortunes for himself. Here, also, he made the acquaintance of Louis Bernard, a young civil engineer of unusual promise and talent. Despite this promise and talent, however, the young man was poor as a church mouse. But, in Mr. Gordon's eyes, this fact was any thing but a disadvantage. He was so very

eccentric—so very crazy, his friends said—that he looked upon poverty somewhat in the light of a badge of merit; and, when he found that a love-affair was developing between his pretty Annie and young Bernard, instead of turning the penniless suitor out-of-doors, he told him that he might marry the maiden as soon as he could support her in a respectable manner. Encouraged in this way, the love-affair became an authorized engagement, and was of six-months' standing on that bright April morning when our story opened.

Now, while the two lovers sat on the trellised piazza, and with the glory of sunlight and fragrance of flowers around them, laid countless plans for their blissful future, Mr. Gordon, as his daughter had rightly surmised, was peering in and out among the machinery of the engine and car-shops, located near his house. These car-shops formed quite a large establishment, for the railroad, to which they belonged, was very flourishing, and it was here that most of its rolling-stock was constructed. Consequently, the latest improvements in machinery were always to be found here, and consequently, also, it was a great resort of Mr. Gordon's. The employés knew him well, and, although they considered him a little "touched," liked him amazingly. The authorities, however, looked at him askance, and it was only the master-machinist who ever went out of his way to do him a kindness, or show him a civility.

This man, though only thirty-five, ranked high in his calling, and had entire control of the works. His name was Liddell; he was gentlemanly, though not a gentleman, and had for some time assiduously cultivated Mr. Gordon's acquaintance. To accomplish this was not difficult, since there was that best possible foundation for acquaintanceship, a common taste, between them. But the most natural things frequently excite gossip in a country-town; and unscrupulous news-mongers did not hesitate to say that the bright eyes of Annie Gordon possessed more attraction to the master-machinist than did her father's discourses on cog-wheels and piston-rods. However that might be, Mr. Liddell was one of the few visitors who ever crossed the threshold of the old house; and, in a quiet way, both father and daughter liked him cordially.

On this morning, as Mr. Gordon stood attentively regarding the action of a certain new-fangled cylinder, the master-machinist came out of his office and walked up to him.

"I am glad to see you, Mr. Gordon," said he, after the first salutations were exchanged, "to congratulate you on young Bernard's good luck. What a fortunate thing it is for him!—and I suppose I may congratulate Miss Annie, too."

Mr. Gordon looked up, and with his head full of the cylinder, did not understand the drift of this remark.

"Bernard's good luck!" he repeated. "I have not heard of any special luck of his. What has he fallen upon? A good position?"

"Something much better than a good position," answered Liddell, shrugging his shoulders. "I wonder you have not heard—everybody is full of it—he has made a fortune by a patent."

"A fortune!—by a patent!"

"A fortune undoubtedly, and by a patent. Why, I am astonished you don't know any thing about it. I supposed, of course, Bernard had been consulting you all this time. And in fact I thought—I felt sure—that you had a hand in the matter. The idea looks like you—at least I fancied as much."

"What is the idea?" asked Mr. Gordon, all in a fever, immediately. "The scamp has told me nothing whatever about it—very shabby of him, I think! I always knew he had sense, however—I always knew he would make his fortune sooner or later—only I did not look for it quite so soon! What is the idea, Mr. Liddell? Bless my soul!—to think of a patent!"

"The idea is something quite new, at least in machinery," said Liddell. "I don't know that I can explain it—I'm not a good hand at description—but if you'll step into my office I can show you a design that Bernard made out to show me what it was, and how it worked. That fellow has a most capital head."

"Yes," said Mr. Gordon, assenting most sincerely about the head; but he hesitated, and evidently did not like to inspect the design. "If Bernard had wished me to see it—" he began, with some dignity, but Liddell interrupted him.

"My dear sir," he exclaimed with a laugh, "don't you see why Bernard said nothing to you about it? He was afraid the thing might not succeed, and he wanted to spring a success and not a failure upon you. No doubt he is at your house now, telling the good

news to Miss Annie, and, meanwhile, where is the harm of taking a look at the design? The patent being all safe, anybody and everybody may see it."

"I suppose there *is* no harm," said Mr. Gordon; and, the temptation being too strong for his dignity to resist, he forsook the cylinder, and followed the machinist to his office.

This office was a small box, with a table, two chairs, and a desk, in it. Placing one of the chairs beside the table, for his visitor, Liddell opened the desk and busied himself in extracting a particular paper from a crowded pigeon-hole. After some trouble, this was accomplished, and then he unfolded and spread it out—a large sheet covered with India-ink designs—before the eyes of the eager inventor.

The latter rose and bent forward—trembling with excitement. Any thing that related to inventions or patents interested him deeply, but the present matter came home to him almost as if it had been one of his own. Bernard's invention! He was eager to see what the boy had managed to accomplish; so eager, indeed, that for a moment this very eagerness defeated its own object. The paper swam before his eyes, the diagrams danced to and fro, and he saw nothing. After a second, however, the mist cleared, and then, as his glance fell on the principal design, the idea showed itself clear and distinct. He saw it, caught it, suddenly gasped, and fell back into his chair almost fainting.

Liddell, who was looking at him, was seriously alarmed, for he thought he had at least a case of apoplexy on his hands. Seizing some water that chanced to be near by, he sprinkled it over the pallid face, and, snatching up a newspaper, fanned the swooning man vigorously, loosening his cravat at the same time. In a few minutes these remedies had their due effect. Mr. Gordon recovered himself, looked up, and finally spoke—with a strangely-pitiful quaver in his voice:

"Let me see it again. I—I must have been mistaken."

"My dear sir, what is the matter?" cried Liddell. "Is there any thing—"

"The design! the design!" interrupted the inventor, with feverish energy. "My God, man! don't talk to me when I am almost mad! Show it to me instantly!"

The tone was so peremptory that the other obeyed at once. He held it up, and Mr. Gordon leaned forward, examining it intently. He said nothing; but the naturally pale hue of his complexion grew almost ashy, and his hands clasped and unclasped themselves convulsively, while more than once his lips quivered as if with unspoken words. At last he motioned it away, and rising, without a syllable, tottered, rather than walked, to the door. By this time, however, Liddell had somewhat recovered from his first surprise, and thought it time to interfere, so he followed and caught his arm.

"Mr. Gordon, pray sit down," he said. "You are not fit to go out in this state. Take some water—try to compose yourself. Good Heavens, sir! what is the matter?"

"Nothing is the matter," said Mr. Gordon, faintly, but he sat down and took the water—indeed, it was a matter of necessity to do so. "Nothing is the matter," he repeated wearily; adding in a lower tone—"nothing—nothing but the old story."

"I hope you are not vexed with Bernard for not letting you know. I assure you—"

Something in the face before him stopped the machinist at this point. Involuntarily he ceased speaking, and said nothing, even when, after several minutes had elapsed, Mr. Gordon rose and silently left the office.

He walked down the street toward his own house like one stunned. The people who met him looked in his face, shrugged their shoulders, and said to each other, "The man grows more crazy every day." But when he reached home, when he opened and closed the front-door, crossed the passage and stood in his own room, this unreal quietude gave way. He looked round on the darlings of his heart, the mute children of his brain; he gazed pitifully at that jealously-locked cabinet, where the toil of so many weary months, of anxious days, and sleepless nights, was drawing to a successful issue; he glanced at the table where long lines of abstruse calculation met his eye; then, with one deep groan, he sank into a seat, buried his face from the light, and sat a picture of stricken desolation.

In this state his daughter found him, when she entered, followed by her lover. Her eyes were so dazzled by the bright sunshine, from which she had come, that for a moment she did not see the relaxed figure bent forward over the useless papers; but the next instant she

caught sight of it, and rushed forward, with her whole heart in her voice.

"Papa! what is the matter?"

Mr. Gordon raised his face, and the mere sight of it seemed to petrify her, for she stopped suddenly, and stood motionless. Never in all her life before had she seen a face so set and bloodless, and never had she met such a look as gleamed on her now from her father's eyes. "Papa!" she cried again, with a startled appeal in her voice—and as she paused Bernard spoke.

"Something has happened, Mr. Gordon! Something is the matter! What is it?" he said, hastily.

In a moment, as it were, the inventor was himself—indeed, more than himself. Few people who knew the abstracted devotee of science, the pale scholar whose mind was habitually absent from the earth he trod, would have recognized him in the man who faced around upon the speaker, his face glowing with passionate energy, and his eyes flashing with indignant fire.

"You ask me that!" he said. "You dare to enter my room, side by side with my daughter, and speak to me—to me whom you have so shamelessly betrayed? Your audacity almost equals your villany, and I have but one answer for you—leave my house!"

There is no exaggeration in saying that if a thunder-bolt from heaven had rent the solid walls asunder, neither Bernard nor Annie could have been more confounded than by this unexpected and unprecedented outbreak. "Oh, my poor father!" cried the girl, under her breath, for she thought that veritable madness had come at last; but the young man, after one gasp of astonishment, saw that there was nothing of insanity in the steady face fronting him, and, as well as he could command himself, answered:

"I don't understand this. I am so little conscious of having offended you, that I must ask you to be more explicit. What have I done? What do you mean by accusing me of villany—by saying that I have betrayed you?"

"Answer me one question," said the elder man, sternly. "Have you not patented an invention?"

"An invention!" Bernard started; then added more quietly, "I came this morning to tell you that I had done so."

"To tell me!" It is impossible for words to express the indignant scorn that was in those three words—"To tell me! Well, in return, I will tell you that you are a thief!"

"Papa!"

It was Annie's voice that rang through the room with this cry of indignant reproach, but, for a full minute, Bernard made neither sound nor movement. When those bitter words fell on his ear, he took one quick, unconscious step forward; but the next he remembered himself, and fell back. In the minute that followed, he fought a fierce fight for self-control, and gained the victory. When at last he spoke, the veins were standing out on his forehead like knotted cords, but his voice was steady and firm.

"I have only one reply to make, sir—substantiate the charge."

"That is easy enough to do, if you will be kind enough to describe the nature of your invention."

Coldly and concisely the young man complied with the request. He described the nature of the conception which he had worked out to a successful result, and briefly added the explanation which he had already made to Annie, a statement that the original invention was not his own, and an account of the difficulty he had encountered in bringing it to practical operation. Mr. Gordon heard him out, without interruption of any kind, and was silent for a moment. Then he said frigidly:

"Do you decline to give the name of the original inventor?"

"I have no option but to decline, so long as he chooses to hold me bound to secrecy."

"Is he likely to hold you bound to secrecy if your good name is at stake in the matter?"

The young man threw his head back haughtily.

"My good name is not likely to be at stake, sir, with any one who knows me."

"Is it not?" said the other, with a short, hard laugh. "Then it is only because men will believe your word in preference to that of the mad old inventor. Perhaps you counted upon this, however. If so, the calculation did you credit."

"Papa!"—Annie broke in, with a wail, "why do you say such cruel things? Louis does not understand them, and neither do I.

Speak plainly, for Heaven's sake! Tell him—tell me—of what you suspect him."

"I suspect him of nothing," said Mr. Gordon, sternly, "On his own evidence I convict him of basely stealing my invention, the invention at which I have labored so long—the invention which was dearer to me than you, my child of flesh and blood—and of patenting it for his own use, and in his own name."

"Papa!"

"Look at him," said the inventor, rising and pointing with an almost tragic gesture at the young man. "Look at him! Tell me if that is the face of an innocent man."

And in truth, at that moment, Bernard's face was scarcely that of an innocent man. The very nature of the accusation had stricken from him all means of defence, while its suddenness so completely overwhelmed him, that he stood in the centre of the floor, a pale, silent picture of what seemed detected guilt. Not so thought Annie, however. She gave one glance at his face, and then sprung to his side.

"Louis, Louis, dear love, don't take it so!" she cried. "He does not mean it! he will be sorry for it yet. Oh, it is cruel!" she exclaimed, turning round upon her father. "You outrage him, and you outrage me! Papa, papa, how can you—how could you?"

"Perhaps you had a share in it too," said the inventor, bitterly, as her voice broke down in tears. "I was a fool to trust you—to trust anybody. I might have known that treachery and robbery would be the end. With or without your connivance, he must have obtained the design from you."

"From me!" cried the girl, with a startled gasp—for she had not expected this. Then she turned to Bernard and held out her hand. "O Louis, see how little he is himself! see how little he means it! see how little you can resent a charge in which I am included!"

"I resent it only thus far," said Bernard, looking at Mr. Gordon. "I ask now, as I asked before, to hear the evidence on which I am condemned."

"You shall see it," answered the other, briefly. He went to the cabinet, unlocked the door, and took out a large portfolio. Bringing this to the table, he opened it, and bade the young man come forward. When he came, several designs were spread before him. He took them up, one by one, and examined them closely. This occupied some time, and after putting down the last one he still remained silent—his face deadly pale, and his eyes bent downward in deep thought. It was only when Mr. Gordon asked what he had to say, that he looked up and spoke.

"I have only to say this—that Fate is against me," he answered.

"I cannot refute the evidence of these papers. I am, indeed, astounded at it. I can only assert my own innocence—and of course that assertion counts for nothing with you. I do not believe that the man who applied to me stole the invention; for, in the first place, he is a man of honor, and, in the second place, he had no opportunity to do so. Therefore, I can only believe that it has been a strange coincidence of thought. God knows how much I regret having had any part in it; but of one thing you may be sure—until of your own accord you retract the accusation made this day, I will never touch one cent of the profits. I have not much hope of such a thing—but the truth may come to light some day. Until then, sir, I return you many thanks for your past kindness, and bid you good-by. Of course, you know that I shall not enter your doors again. Annie—darling—"

His voice broke down here; but he held out his hands, and in a moment Annie came to him with a rush. She was weeping bitterly, and in the midst of their parting embrace only two or three words were exchanged. "Don't forget me!" sobbed the girl. "Trust me!" whispered the young man, and that was all. Then they tore themselves apart, and Bernard went hastily out. When the heavy front-door closed upon him, a bitter pang shot through his heart. He was dreadfully conscious that it was for the last time.

[CONCLUSION NEXT WEEK.]

SOAP AND PERFUMERY.

THE use of soap does not go back of three hundred years. Gentlefolk of the middle ages concealed absence of cleanliness by the use of scents. The luxurious Greeks saturated their garments with

essences. Fuller's-earth was the only detergent that supplied the toilet of an Egyptian princess. Esther prepared herself to go in to King Ahasuerus with "oil of myrrh and sweet odors." The Hebrew word *borith*, translated "soap" in our authorized version of Jeremiah and Malachi, means alkali. For her bath in the river, Nausicaa was fortified, writes Homer, "with life-elevating food and refreshing wines, oil for anointing and perfumes to sweeten." The utter impossibility of thoroughly cleansing the skin by the use of water alone makes the immoderate use of scents by the ancients intelligible. In no other way than the absence of soap can the constant reference made by the poets and historians of Greece and the farther East to perfumes and oils, whenever bathing is in question, be satisfactorily accounted for.

In the washing of garments and household effects, steatite, or soap-stone, joined to other agents, shortly to be mentioned, seems to have been generally employed. This is a silicate of magnesia, white or purple in color, resembling talc in composition, of a fatty feel, cold to the touch, slightly soluble in water, largely distributed over the earth's surface, and generally known. Thoroughly-cleansing power it has not. It forms, with water, no chemical compound. Moving easily over surfaces, it serves, in a mechanical way, to partially extract spots from clothes and furniture. Plants with saponaceous juices (*struthium*) became also detergents. Solutions of soda and potash were known. Strabo speaks of an alkaline water in Armenia, which was used for washing clothes. Natron, a native sesquicarbonate of soda—a salt called *trona* by mineralogists—mingled with lye made from the ashes of wood, was the accepted agent in temples for cleansing oil and wine jars, and purifying images of the gods. Putrid *lotium*, however, was the universal solvent of dirt. The cleansing qualities of this complex salt appear to have been known from the beginning of the world. In the North-African states, in Persia, and parts of Russia, it is in extensive use at the present time for cleansing garments. The famous *blanchisseries* near Paris make it a constant element in the intricacies of their unequalled laundry-work. Woollen-manufactories create of it an article of extensive commerce. It is the agent of the Jews in Petticoat Lane, the soiled gatherings of the "old-clo' men" all over England for the stalls of Rag Fair being renovated by its use. No wonder that the fullers in ancient Rome, in whose business it was the only detergent, were in proverbial bad odor, nor that municipal edicts banished their trade out of town.

Soap-boiling, or the making of soft-soap for domestic use, cannot be traced back of the seventeenth century. Its discovery hardly antedates the reign of the first James of England. It is not a pleasant aspect presented of the gentles and nobles of heroic days, this absence of soap from boudoir and bath. It is none the less true, however, that neither Isabella of Valois nor Joanna of Navarre, Margaret of Anjou nor Elizabeth Woodville, Catharine of Aragon nor Anne Boleyn, nor even the beautiful Jane Seymour, nor unfortunate Mary Stuart, knew the luxury of soap in the toilet. Extracts and perfumes, cosmetics and powders, unguents for the hair and *poudres de senteur* for the complexion, they used in abundance. But the one indispensable detergent of modern life—that for which every other auxiliary to womanly attractions and manly self-respect would be sacrificed—they had not. Soap, in either solid or saponaceous form, comprised no part of the mysteries of ladies' boudoirs. The simple union of the lye of ashes with the fat of animals is a discovery so modern as to excite utmost wonder.

There is no greater stride in modern progress than that from domestic soap-boiling of the seventeenth century to soap-manufacture of the nineteenth. The researches of Chevreul were perhaps the starting-point. His successors smoothed the way. Sir Humphrey Davy showed a goal beyond, and the great and good Faraday, whose loss to the scientific world it seems impossible to repair, removed all obstacles to the attainment of what his predecessors only foresaw. On the other hand, in practical results, the world owes most in this branch of industry to James Muspratt. Soap-makers, at the beginning of this century, depended upon barilla and kelp. The supply was limited. In unfavorable seasons it was uncertain. Prices rose and fell. The successful manufacturers of one year were bankrupt the next. But, when Muspratt, adopting Leblanc's idea, began to prepare soda from sea-salt (*chloride of sodium*), every doubt about sufficiency of the raw material was removed. At first, the soap-manufacturers did not see it. They refused to use the new product. Muspratt, certain of ultimate success, began to give away the product of his works. For nearly three years he pushed forward a losing busi-

ness. Ten thousand tons of soda were disbursed without charge to soap-boilers before they were convinced of the advantages it gave them. "It is a long lane," says the proverb, "that has no turning." The change came. Time and money are invincible arguments. At the beginning of his fourth year, Mr. Muspratt not only ceased giving, but was obliged almost to cease selling. Orders for soda poured in like a torrent. He could not supply one ton in a hundred. Increase of manufacturing power, economy of labor by new inventions, and restless work by night and day, failed to keep supply adequate to demand; and only by the substitution of iron in place of wooden carts, so that the soda, *red-hot*, could be discharged from his mills, was he able even measurably to satisfy his customers. For a time, a constant race was kept up between soap-making and the production of soda. The stimulus at last equalized results, and it is a fact worth noting that, within ten years of Mr. Muspratt's start, the single seaport of Liverpool exported more soap annually than all the seaports of Great Britain had ever done before.

In connection with this marvellous increase of soda and soap, there grew up an important secondary product—*hypochloride of lime* (bleaching-powder), which is largely used in all branches of chemical trades. In fact, soap occupies perhaps the most important page in the history of applied chemistry. It has opened channels to commerce, discovered new raw materials for its own production, and thus become the means as well as the mark of civilization. Almost simultaneously with employment of soda came the oils of the palm and cocoa-nut. They were at once introduced into the manufacture of soaps. From 1820 to 1868, the annual importation of palm-oil into England grew from seventeen thousand four hundred and fifty-six hundred-weights to nine hundred and thirty-seven thousand and fifty-four hundred-weights.

Perfumery, unlike soap, is of ancient origin. Layard's "Assyrian Sculptures" depict perfumes burning before the conqueror. On the walls of Egyptian temples the censer smokes before the presiding deity. Spices scented the sacrifices; sweet odors ascended from alabaster vases at feasts; and drugs of strong perfume performed a principal part in embalming the bodies of the dead. Moses prepared perfumes for the persons of the priests and offerings on the Golden Altar. The spouse in Canticles delights in spikenard and cinnamon, aloes and myrrh. Ezekiel accuses the Levites of defrauding the altar of its scented offerings, in order to give grateful odors to their garments; and Mary, at the house of Simon the leper, broke the alabaster-box of spikenard, very precious, and poured its contents on the head of Jesus.

Of the use of perfumes by the Greeks and Romans, historical accounts are copious. Pliny devotes pages of his works to the method of preparing perfume-drugs, their uses, salubrity, and cost. Seneca describes the lavish application of oils and powders, the employment of essences three times a day by the luxurious and wealthy, and the costly *narthecia* in which scents were taken to the baths. Strabo writes of the trade to the Orient, how the demand for perfume-drugs caused ships to plough the Red Sea and camels to plod the desert, and how Syria and Greece owed their growth as markets to the same cause, as well as the rock-encircled Petra its vitality. Southern Italy ministered, by the preparation of curious compounds, to the voluptuous taste. *Unguentarii* filled the great street of Capua with their workshops. Catania received raw materials, and shipped the manufactured products to every open port of the West; and Palermo, in Sicily, by discovery of a new perfume, grew up from a struggling hamlet to a large commercial town. In short, whether to regale the gods in sacrificing, or themselves in feasting—to conceal personal smells, or to attract by agreeable scents—the consumption of perfumes among the ancients far exceeded their use in modern times.

Modern science divides perfumes into four classes:

CLASS FIRST consists of gums and resins. They are obtained either by collecting the natural exudation of many tropical trees, or by tapping their trunks and drawing off the sap. The oldest of known perfumes are in most extensive use all over the world. Myrrh, camphor, olibanum, benzoin, gums employed in incense, and resins used in pastels, make up this class of perfumes.

CLASS SECOND comprises perfumes obtained by distillation. The art of distilling runs back into the distant ages. The most ancient archives of China describe the process. Buddha of the Hindoos was himself a distiller. Barbarous nations of Central Asia inherit knowledge of distillation from the earliest times. It does not appear to

have been applied to extract perfumes until a later day. But, as the Greeks learned the use of the still, imported by them from Egypt, they adapted it to the separation of the odorous principle from the numerous fragrance-bearing plants indigenous to the Piræus. Rome followed. Southern Italy, over whose slopes and sun-warmed valleys aromatic flowers bloomed in every season of the year, enlarged the process; and in its extension Naples and the Sicilies became what they are at the present time—the great producers of the ottos or quintessences of commerce. To this day, the essential oil of Neroli, produced from orange-flowers, and named from Nero, during whose reign it was discovered, is distilled only in the delicious climate of Sessara. New processes have never quite superseded the distillation of essential oils. The old method, while more expensive, produces most perfect results. Still all essential oils are slightly soluble in water, and, though those extracted in Italy are most retentive, they, with others, when brought into contact, give out the rose-water, orange-water, elder-water, and citron-water of commerce.

CLASS THIRD comprises perfumes proper for the handkerchief. The scent is comparatively new. For two hundred years, indeed, from the province of Var, in France, a peculiar species of essences has found sale in the markets. No one seems to have looked into their origin. Climate was supposed to give the peculiar odor. Attempts to imitate them were failures. They possessed a living fragrance which all decoctions refused to yield. It has been lately ascertained that the principle and process which produce these perfumes are new. The odors of flowers do not exist as in a gland; they are a living exhalation. While the plant lives, they develop, day by day, in its flowers. When it dies, they give what they contain, but produce no more. Acting upon this great fact, which perfume-producers had never discovered, the peasantry of Var cultivated their plants, and gathered only their flowers. Vast fields of roses, oranges, acacias, violets, jasmines, and jonquils, were tilled simply for the blooms they yielded, never for sprays or leaves, branches or stems. At flowering-time, the population is busy gathering, day by day, the constantly-renewing product. It has been long known that grease attracts and holds the scent of flowers. By *enfleurage*, then, as the Varians term it—that is, by laying flowers upon sheets of glass over which layers of grease are spread—the perfume of each kind is caught and retained. The work goes on through the season. Manufacturers purchase the flower-leaves at fixed rates. Glass plates, covered with fresh oleaginous coats, are in readiness for every day's gathering. Departments for each kind of aroma are separate from all others. The grease, once impregnated, is removed, put into jars, and new laminæ spread upon the glass plate. The process is continued to the end of the season. Alcohol is then poured into the jars, allowed to remain until it absorbs the scents from the grease, emptied into cans fitted for exportation, and then shipped for the Parisian market. The grease, retaining only its oleaginous properties and smell, is used for other purposes. There are other processes by which perfumes for the handkerchief are produced. That of *eau-de-cologne* is one, of clematis another, maceration a third; but they are too well known to be enumerated here.

CLASS FOURTH includes all scents of animal origin. Among these, musk is the first in commercial importance. The value of its imports into England, in 1868, was more than fifteen thousand pounds. Its qualities are universally known. The subtle nature it possesses pervades every thing. A polished-steel surface will hold the odor of musk for years. Ambergris, the favorite perfume of the court of Louis XIV., and which saintly George Herbert names in "The Odour"—

"How sweetly doth MY MASTER sound! MY MASTER!
As ambergris leaves a rich scent
Unto the taster.
So do these words a sweet content,
An Oriental fragrant—MY MASTER!"—

has nearly gone out of use. Only two hundred and twenty-five ounces were imported last year into Great Britain, valued at two hundred and twenty-five pounds. It is soluble in alcohol, is chiefly composed of a peculiar animal substance called *adipocire*, possesses an agreeable odor, and is used in compounding lavender-water. Civet, also, has lost its once great reputation. Civet-cats used to be purchased by the drug-dealers of Holland at twenty pounds each. Pure civet sold, during the reign of Elizabeth, at a price as high as sixty shillings (equivalent to seventy dollars now) an ounce. The medical virtues

attributed to it bordered on the marvellous. But, both as medicine and perfume, it has been laid aside. Shakespeare's fop might ask at every druggist's shop in Broadway, "Give me an ounce of civet, good apothecary, to sweeten my imagination," without the slightest prospect of success. It must be still used for some purposes, however, since three hundred and fifty-five ounces were imported into London in 1868, at a valuation of three hundred and ten pounds sterling. Hartshorn (ammonia), on the contrary, included in class four, is in constantly-increasing demand.

Essential oils, under the name of ottos, are still a large article of traffic. In 1867, three hundred thousand pounds of these oils were imported into England, at a valuation of two hundred and seventy thousand pounds. To produce this large result, musk figures at above ten thousand five hundred pounds; otto of roses, at thirteen thousand seven hundred and fifty pounds; vanilla, at twelve thousand five hundred and sixty pounds; and thirty-seven other essential oils make up the sum total.

In conclusion, let us notice one of the extraordinary discoveries of modern chemistry. To produce perfumes, neither gums nor flowers, earthy deposits nor animal secretions, are necessary. Scents of roses; aromas of jonquils; perfumes of vanilla; and odors of violets, acacias, and jasmynes, are now obtained from substances associated only with disgusting smells. Fetid fusil-oil, cast away for many centuries as the most repulsive of chemical products, has become a principal agent in the modern manufacture of pear, peach, cherry, green-gage, strawberry, and orange oils. Butyric acid, formed by rancid butter and decomposed cheese, yields the most perfect essential oil of bitter almonds. Treated in a different manner, it gives pineapple-oil. And from the drainage of cow-stables are obtained the essential ingredients in the popular perfume of *eau de mille fleurs*.

N. S. DODGE.

THE PHILOSOPHY OF BORROWING.

"Neither a borrower nor a lender be,
For loan oft loses both itself and friend,
And borrowing dulls the edge of husbandry."

THIS was the advice Polonius gave Laertes on the eve of his first start in life. Excellent advice; but impracticable, as society is constituted. Why, bless the dear old man, what was he thinking about? Borrowing is as old as lying; they are, in fact, correlatives. If a man is neither to be a borrower nor a lender, what *is* he to be, we should like to know? Society is divided into two great classes—borrowers and lenders! It is in beautiful natural harmony. Every needy soul finds a kindly and genial soul possessing that surplus which shall minister to the needy one's wants. The rich man is only Nature's treasurer; he but holds in trust that surplus, riches—call it what you will—with which he can relieve his poorer brethren. It is like positive and negative electricity—*plus* and *minus*; when there is too much *plus*, then there comes a social thunder-storm, as exhibited in periodical commercial crashes. This might have been avoided if the poorer brethren—the borrowers—had been permitted to draw off the surplus electricity—riches—in "*sparks*"—that is, in loan—there would have been no shock. As M. Proudhon remarked, "It was never intended that one man should hold the property of thousands, unless as a trustee to advance it as required." A rightly-constituted man can never feel more happy than when honoring one of these sentimental checks. The pleasantest part of the transaction consists in the little fiction about repayment. Nobody is deceived. The lender never expects to be repaid, and the borrower never intends that he should be! But it enables both parties to retain their self-respect.

Perhaps the oldest authentic case of borrowing was the case of the Israelites, who borrowed from the Egyptians—and never repaid them. Julius Cesar was a great proficient in the art; his debts considerably exceeded five million dollars. The Plantagenets, Tudors, and Stuarts, were terrible borrowers. King John extracted loans from the Jews by the ingenious process of extracting their teeth! One tooth *per diem* (without chloroform or laughing-gas) until the loan was effected! One obdurate Israelite is stated to have endured the drawing of half his teeth before he would make up his mind to draw a check. This ill-conditioned individual was thus mulcted both in money and teeth. Moral—Never show your teeth when asked for a loan. Edward I had a terrible plan for borrowing from the Jews.

It was a system of forced loans. He cruelly tortured the wretched Hebrews until they yielded up their hoards. If they grumbled, he either put them to death or banished them from the kingdom. Fancy the British Chancellor of the Exchequer nowadays negotiating a loan with Baron Rothschild by means of an earnest appeal to that gentleman's teeth! History calls Edward I. a great king. We consider him to have been a cruel and rapacious tyrant, who not only robbed and tortured the Jews, but barbarously murdered the Welsh bards. But Jews or poets were not held of much account in those iron ages.

That tipsy Solomon—James I.—was a mean borrower. He is said, on one occasion, to have borrowed a pair of silk stockings from one of his nobles; he had not even the manhood to borrow a dozen pairs. Charles I. borrowed on a truly regal scale. The loans, or "benevolences," were forced out of the unfortunate landholders by fine and imprisonment. Charles II. borrowed from everybody. He not only borrowed his people's money, but their wives and daughters; he borrowed from the King of France. He was the falsest, meanest, and merriest reprobate who ever lived an infidel and died a Roman Catholic. Charles II. also instituted the national debt of Great Britain, but it was William III. to whom the nation was indebted for the regular establishment of that noble British institution: also for the introduction of the cat-o'-nine-tails. William was a great prince, but inordinately fond of green peas. He is said to have invariably consumed the first dish of that agreeable vegetable without sparing his poor queen even a spoonful. Great men have their little failings. During the reign of George III. the nation took to borrowing from itself at a frightful rate. The wicked and absurd war with France added more than two billion dollars to the national debt. Some English people admire this beautiful institution as a great blessing provided by the wisdom of their ancestors, and mysteriously connected with the national prosperity. We wish them joy of their taste. George IV., who possessed all the vices of Charles II., with the addition of a few special ones of his own, borrowed shamelessly from everybody who would lend him a shilling. We need scarcely add that he never paid anybody. In fact, the only debt he ever did pay was that of Nature; and he could not well escape that. The clothes, wigs, etc., of this great and good prince are said to have cost the nation fifty thousand dollars per annum! The population of a large village might have been fed for a smaller sum. The coronation of "Georgius" cost over one million two hundred and fifteen thousand dollars. We forget the cost of his funeral, but the nation did not grudge that!

To turn from these magnificent borrowers of millions to the humble borrowers of dimes seems pitiful, but is necessary to enable us to trace the ramifications of the art. Some men seem to be born borrowers. Their clothes and schooling are borrowed; at least they are never paid for. They borrow bats, balls, and marbles; they borrow cents; by-and-by they borrow dollars; until, after a life spent in borrowing, they go hopelessly to the bad, borrow a razor, and—are buried in a borrowed—that is, a charity—coffin. Some men spend their lives in borrowing books, and, if they are industrious, collect at last quite a library. Other men have a mania for borrowing umbrellas. Poor Douglas Jerrold had a capital story on the subject: Jones borrowed Brown's umbrella. One wet morning Brown meets Jones comfortably protected by the borrowed article. "Hah! Jones, how lucky—my umbrella. I'm wet through." "You can't have it," says dry Jones, "I want it myself." "But what am I to do?" gasps Brown. "Do!" retorts Jones, "why, do as I did, you fool—borrow one."

Some men are always borrowing their friends' names—on the backs of hills. It is facetiously termed "getting up behind." It is very easy to "get up," but a very different matter to "get down," and generally involves a tumble. There are, positively, men in New-York City, who, like our imported sparrows, do not know in the morning where their daily crumbs are coming from. They trust to borrowing; yet how light, airy, and unembarrassed is the demeanor of a man of this class! Nature tells Brass that he has not breakfasted. Hah! how fortunate: yonder comes Allworthy, a kind, warm-hearted man, born to lend. A request for the loan of a five-dollar bill is instantly preferred. (Brass never borrows less than a "fiver"—he says it's mean.) Allworthy hesitates, for he has bled on more than one occasion; but he is a man who has all his life labored under a difficulty about saying no in the right place. Sadly, but with resignation, he places the desiderated stamp in the other's outstretched palm. 'Tis done; and Allworthy enjoys the satisfaction of knowing that his friend's wants are provided for. Not, however, for long, for there is

not much spending in borrowed money. Men of Brass's class have a partiality for salmon, turkey, spring lamb, and green peas; agreeable viands, but running into money.

A very numerous class borrow other people's ideas, inventions, even jokes, and thrive upon the larcency. The reader will perceive that we consider thieving and borrowing, without any intention of repaying, as convertible terms. It does not speak favorably for the morality of English playwrights, that more than one-half the farces and sensational dramas are borrowed from the French. We never heard of the French borrowing from the English. There are certain folks who flaunt in borrowed plumes. Mrs. Grenadine, for instance, is going out shopping, and borrows Mrs. Shoddy's carriage, laboring apparently under the delusion that people will take it for her own, and that she will receive homage and "kotou" in consequence. Error! Mr. Stewart's salesman, with one discerning glance at the coachman, perceives the true state of the case. Coachmen do not like being "loaned," and have a quiet but unmistakable manner of showing that the "party" they are attending upon is *not* their own mistress. Then there are the people in the middle rank of life, who, whenever they give a party, make a point of borrowing articles of plate wherewith to adorn the table. Mrs. Spannew expects a few friends: the affair must be quite "genteel" (odious word), so she borrows Mrs. Tiptopper's "épergne," and Mrs. Flash's silver cake-basket and electro-candelabra, Mrs. Scupp's handsome presentation salver, and other articles of *vertu*. She also borrows a waiter—not a dumb one—but a hired one, a dreadful man in shabby black, a limp, white neckcloth, and white Berlin gloves, who yawns fearfully during the repast (poor fellow! he has been up three nights running), and the guests have the satisfaction of pretending to gaze with the eyes of strangers on their own belongings, and of complimenting Mrs. Spannew on the handsome appearance of her table! Then these unfortunate people quaff cheap champagne with fearful inward misgivings, to be too surely realized on the morrow.

Give not, dear reader, your autograph to the children of Israel! Avoid the professional money-lender as you would the east-wind. Beware of the money-lender, for his ways tend unto bankruptcy. Borrow money only on the direst necessity. If you borrow of a friend, do it with the firm and steady resolution of honestly repaying him—sooner or later. We remember a funny story of an unfortunate borrower, who in his penitential moments used to abuse his image in the looking-glass. "You horrid dolt, you wretched fool, you drivelling jack-anape; don't shake your stupid fist at me. I've a great mind to knock your ugly head off your foolish shoulders, yaha! you ought to be ashamed of yourself!" The man felt humiliated. Indeed, a borrower, in presence of his creditor feels but half a man. How can you argue the point with a man to whom you owe money, without a sort of horrid fear that, if you get the best of it, he will retort with "By-the-by, you owe me fifty dollars!" You seem to see "fifty dollars" gleaming in his teeth, twinkling in his eye, and radiating from his whiskers. A man who borrows money is a man on crutches, he is artificially supported; he is not a man—only a poor cripple. Therefore we say, if possible, borrow not at all. A shored-up house is an unsightly object, dangerous to its inmates, and shunned by the passers-by.

LÉON GAMBETTA.

IT is not only true, as the trite saying hath it, that great occasions call forth great men to cope with them; it is also true that such occasions often cast into a sudden obscurity those who have hitherto been the leading spirits of a nation or party, and who make way for those who are younger and less known.

When Napoleon III. laid his sword "at the feet of your Majesty," after Sedan, every one felt that his reign and imperial government in France were at an end. For the moment, every eye turned toward Paris. What would be the next phase in French politics? Would the Orleanists, the Bourbonists, or the republicans, prevail in the sudden crisis? Almost every tongue predicted a revolution; and forthwith, on the heels of the easy prophecy, a revolution ensued. Then, the wiseacre who did not foresee a republic was shallow indeed. But, revolution triumphant, the republic a fact, who would rule this not only revolutionary and republican, but invaded and beleaguered, France? Here the prophets had a wider range of probabilities to encounter, greater uncertainty to venture on. Yet, the answer seemed

thereon forthcoming. On the very morrow after the news of the new republic was flashed by wire and cable to the four continents, behold a flock of refugees—illustrious and obscure, voluntary and involuntary exiles—hastening breathless to their beloved Paris. Victor Hugo, patriarchal and visionary; Ledru-Rollin, with his imposing presence, and the old leonine vehemence; Esquiros, with his black, fine face; Blanqui, still Jacobin and leveller; little Louis Blanc, calm, philosophic, with his bold, dark eye, and his somewhat softened socialism—these, arrived in Paris, seemed to proffer an abundance of brains, experience, and democratic zeal, to seize the helm in this tempestuous storm. But each and all of them were a day too late. In the Chamber itself, there were republicans who held the advantage of presence, had the nerve to seize the chance, and took the flood when at its instantaneous height. Jules Favre proposed and carried the motion to depose the emperor and to abolish the empire. Léon GAMBETTA proposed and carried the motion to establish the republic.

There were, perhaps, fifty or sixty republicans in this last of the imperial legislatures. Among them, too, were old and tried veterans of the old republic. There were Garnier-Pagès, Raspail, Glais-Bizoin, and Crémieux, members of the provisional government of 1848; there were Jules Favre, Jules Simon, Eugène Pelletan, Bancel, of a younger generation, but who had long fought the empire to its face, and had carried the republican standard through many a fierce and stubborn conflict with the ministers of arbitrary power, and immense majorities of hot partisans of imperialism. Yet, not even to any of these devoted and well-tried champions was it given to achieve the place of command in the new state. A younger, less known, and probably greater man than either came to the front, assumed the authority, and at once reaped the honors and bore the burden of accomplishing the long-delayed result. Gambetta not only carried the vote to establish the republic in the terrified and moribund Chamber; he proclaimed the republic to the frenzied thousands who crowded the Quai d'Orsay from the steps of the Palais Bourbon; he organized the republic in that historic hall in the Hôtel de Ville, where were yet marks of the revolutionary bullets of '89, and from whose balcony Lamartine had braved death in rejecting the red flag and raising aloft the grand old tricolor of liberated France. The new provisional government met there—Favre, Simon, Glais-Bizoin, Crémieux, Garnier-Pagès, Rochefort, Gambetta—all but the last two famous republicans of the 1848 and imperial eras. They were all a constellation of subordinate satellites around the central planet, Gambetta; and next to him in power and activity was his young colleague, Rochefort.

What really proves Gambetta's greatness is, not that he obtained power, but that he has kept it, and that he has, as far as we can judge, wielded it to great, though it may be not successful, purpose. At the very first, he summoned order out of chaos, and government out of insurrection. Revolution in France has a bad name; yet this revolution—accomplished in the midst of exasperation and disgrace, of terrible uncertainties and impending dangers, when the eagles of France were debased on the battle-field, the soldiers of France slaughtered, the generals of France imbeciles or traitors—this revolution was bloodless. That howling and bitter mob was swayed and calmed by Gambetta. We must not forget, too, that the hair-brained fanatic Rochefort (as he had been called, not a month before, by an imperialist parasite) came stoutly to the rescue of order, and did his share in appeasing the giant wrath of a betrayed people, bent on swift and indiscriminate revenge. A good day's work was done on that, the birthday of the new republic. Gambetta, as Minister of the Interior, and practically minister of war, prime minister, "chief of the state," too, saw that he must compress the work of weeks into hours. The enemy already was preparing to march on Paris. Whole armies had been swept from the field as prisoners of war. The remainder of the regular forces of France were bewildered and scattered. The hope of succor from without died—if it had not died before—when the republic rose out of the ruins of the empire. The *préfetures* and *mairies*, throughout the land, were yet held by imperialist partisans. Red republicanism surged and swelled in the metropolis. In Lyons, Marseilles, and Bordeaux, the rise of the republic inspired the fanatics, who thought it meant Jacobinism and the guillotine. Indeed, the new dictator, so far as he was known at all, was known as a fanatic—as a rabid fire-eater, involved in plots and conspiracies, who had spoken with a seemingly unbridled tongue when his voice had reached the public ear. He had been one of the "uncompromisers" of the new Chamber, and there had led where the old republicans durst not fol-

low. Raspail alone, stout old chemist, philosopher, agitator, and democrat, supported Gambetta when he defended the absent and imprisoned Rochefort, and proudly demanded his release.

Whence came he, this seemingly rabid radical, who appeared to dream of Utopias, and to insist on their possible immediate realization? Four years ago, Léon Gambetta was a respectable, not at all famous, advocate, thought to be a rather rising young man at the Paris bar. Among the republicans in the metropolis he was recognized as a man and a brother, who appeared not seldom at their private conferences, and was always very zealous, though by no means a frequent speaker, or given to much talking—silently earnest and intense rather than a shouter of the oft-repeated French republican platitudes. He was, further, looked on as a young man of good morals and correct conduct, not given to debauchery, hard-studying in his law-books, seldom seen in social circles. He was, in 1867, growing fast, evidently, in the estimation of his republican brethren; for we find him mentioned, once or twice in that year, as junior counsel on certain political cases, with his present colleague, Jules Favre, as his senior.

It happened in the autumn of 1867 that a new device was imagined by the agitators of Paris to propagate their political creed, and further their designs against imperialism. It was proposed, amid great excitement, to celebrate the anniversary of the martyrdom of Baudin. Baudin, it may not be forgotten, was the deputy who was killed at the first barricade erected in the Faubourg St.-Antoine to resist the *coup d'état*, December 3, 1851. He was standing on one of the carriages which formed the barricade, and was haranguing the soldiers to dissuade them from firing on its defenders, when he fell, struck in the head by three bullets. So slain, Baudin was henceforth enshrined by the republican enemies of the empire as one of their martyrs and one of its victims. In 1867, a subscription had been projected and raised by the republican press in Paris, to erect a monument over Baudin's grave in Père la Chaise, which was marked by no sculptured memorial of where he lay. This idea suggested the other—to make a demonstration on the anniversary of his death. The day came, and the demonstration was made. Crowds of *ouvriers* and students, not unattended by citizens of repute and standing, made their way in the morning to Père la Chaise. It was a bright, clear December morning. The people carried with them wreaths of *immortelles*, with which they strewed the modest grave. There were, however, gendarmes there in force. They grimly lined the walks, and stood in groups at the corners of the avenues. This irritated the mob; for a gendarme acts on a Paris republican as a red shawl on a mad bull. Mutterings were heard. Seditious cries broke out. The emperor was consigned to a locality rather worse than oblivion, and long life was wished "the republic." At this the gendarmes stood not on the order of their action, but acted at once, and—somewhat indiscriminately. They plunged pell-mell upon the people, and here and there effected arrests—some seventy or eighty being dragged out of the "city of the dead," and lodged in the Conciergerie and at Mazas. The trial of these accused traitors—the supposed shouters of the seditious cries—came on soon after. Their advocate was to be Jules Favre. There was intense excitement as to the issue of the trials. The eyes of all France were fixed upon the court; the newspapers were full of the affair; it was pretty shrewdly guessed that the government was resolved to make an example of these men, whether innocent or guilty.

Very shortly before the cases came on, Jules Favre found that unforeseen circumstances would prevent his appearance for the defence. The expense of the defence would be defrayed by the private republican committees. An advocate must be at once selected, both competent and on the spot. Léon Gambetta was chosen; and the opportunity gave him fame and fortune by a single effort. The cause was one in which he had ample scope for his ability as an advocate and his zeal as a republican. He used both to splendid purpose. The court was crowded. The evidence against the accused was meagre and indistinct. The issue in the trial itself was comparatively of secondary importance. The eloquence of the young advocate startled the palace, and inspired his partisans. Its impetuous torrent at times so overwhelmed the parasite judges of the empire that they neglected to check and reprove him. Instead of confining himself to the defence, he in turn became the accuser, arraigned the empire as the culprit, and brought so crushing an indictment against its follies and its crimes that the *procureur* sat speechless, and the audience broke into

enthusiastic and irrepressible applause. It was the greatest forensic triumph seen in that court for many a day.

By it Gambetta at once took rank, at the Paris bar, among the most eminent advocates; at the same time he won a place in the admiration of the Paris republicans which was shortly to serve him in a wonderful and unexpected way. It transpired that Gambetta, like Thiers, Rouget de l'Isle, Ollivier, and so many other illustrious Frenchmen, was born at Marseilles, and that he was then thirty-two years old, having first seen the light in 1835. He was of Italian parentage; a fact betrayed no less in his rather sallow and ultramontane physiognomy than in his name. His family were of the respectable middle class; his lineage was commonplace—not noble, like that of Louis Blanc; nor plebeian, like that of Thiers. He was well educated at the *lycées* of his native town, and studied law, partly at Marseilles and partly in Paris. Some two years since he made his first appearance as an advocate in the Paris courts. He was an attentive, not a deep student, fond of history, poetry, and politics, yet attached to his profession. Such were the meagre facts ascertained of him when, in the spring of 1869, a general election for the Corps Législatif was ordered to take place by imperial decree.

The republicans in the last Chamber but one had numbered only five—called "Les Cinq"—who consented to take the oath of allegiance in order to attack the empire. In the now moribund Chamber the number of republicans was not far from thirty. This Chamber had been elected in 1863; six years of agitation, of active propagation, had passed; the empire had blundered in Mexico, about Luxembourg, and in remaining neutral in the Austro-Prussian War. The republicans, therefore, hoped with good reason to largely increase their number of deputies. The emperor had been forced to extend the liberties of the press and to grant the right of meeting; and this at once proved to the republicans how encouraging were their prospects, and gave them new opportunities to strengthen their cause. The elections of May, 1869, are still remembered for their turbulence and agitation. In Paris the republican candidates were all men of mark, and were, excepting in one district—that represented by Thiers—certain of being elected. Gambetta was a candidate both in Paris and in Marseilles. Both constituencies, by large majorities, chose him. Every large city, excepting Lille and Nantes, went decisively for the republicans. Their number in the new Chamber was—of republicans, certain and reliable, about seventy; of liberals, who might be reckoned on in vital questions to vote with the republicans, about thirty—total, one hundred. Gambetta, for the reason that his Paris constituency was more certain in a second trial to elect another republican, chose to sit for Marseilles. Glais-Bizoin (if I mistake not), who had been thrown out by his Breton constituency, was chosen in Paris in his place.

The empire was even then rocking on its foundations. The meagre reforms of 1868 had not improved its security. The "third-party" ministry of Emile Ollivier had not worked its promised wonders. The old Rouher and Fleury influence at the court was still suspected to be uppermost. The imperialist majority had so wofully dwindled that it was doubtful whether it was really a majority or not; for the old friends of the emperor, such as Garnier de Cassagnac—*les Arcadiens*—bitterly opposed the new ministers. Ollivier was timid and halting, the opposition were vehement and aggressive. Thus stood matters when the session opened in June.

But the opposition, though energetic, was still divided. The republicans, in particular, differed in the manner of their action, though they had a common object. Most of the "left" seemed indisposed to an immediate and sustained warfare *d'outrance* against the government. There was even talk that, under certain concessions, some of them might possibly go over and join the ministry. Two Orleanists, Daru and Buffet, were already in the cabinet. It was now that Gambetta displayed that will and courage, that uncompromising, radical, and open pursuit of his object, which have characterized his later and greater exploits. Flanked by Rochefort and Raspail, the Ulysses and the Nestor of his party, he opened declared war on the empire. Of course, he was a fanatic, a visionary radical, a Utopian; but in this sort of crisis such men lead, and prevail. The promise given by his bond in plea was more than fulfilled by his oratorical efforts in the Chamber. It was impossible to sneer at this earnest and eloquent man, who found no time for polished irony or well-turned periods. Rochefort's imprudences laid him open to ridicule; no one thought of laughing at Gambetta. His physical appearance, though not impos-

ing, gave indications of rare intellectual endowments, and his face, when lit up by the excitements of debate, shone as if by true genius. Of moderate height, well-built, and a little inclining to corpulency; his eyes dark brown and deep, one a little disfigured, but not enough to be remarked unless one were close to him; a bold, strong, rather thick and large nose, distinctly Italian, even Italian-Jewish, in its shape; thinnish, compressed, determined lips; a squarish face, with firmly-set jaws, the mouth and chin covered with a thick black beard; the forehead ample and round, slightly bald above; the black, stubby hair short and thick, excepting on the crown; a general expression, which seemed half-meditative, half-dreamy; rather placid than stern when in repose, as if quite self-convinced and self-reliant, but, when roused to the pitch of passionate, accusing declamation, the features mobile and agitated—so he appeared as he sat or spoke on that extreme left of the Chamber, with whose history he is now so notably identified. His voice was clear, round, and deep; his pronunciation, though often rapid, always distinct; his gestures few, but strong and most expressive. His constant attendance on the sessions; his perpetual vigilance; his keen perception of a weak point in the adversary's armor; his contempt of compromises or of parliamentary tact and prudence; the pertinacity with which he clung to his purpose—made him dreaded by the ministers more than any other deputy of the opposition. A parliamentary leader, under ordinary circumstances, he could not have been; Jules Favre would easily have kept the lead of the republicans in less stormy times. But Gambetta had never been in the traces of party discipline, and had no patience or time to submit to them now.

In the characteristics and temperament which I have described may be seen the reasons why, when the empire was defeated and the republic arose on its ruins, Gambetta should, without question, as it were naturally, assume the chief—indeed, the sole—authority. What wonders he has worked as virtual chief of the state are in a history too recent and too vivid to need recalling. That he has worked wonders, no one will question. By his energy new armies have been raised, equipped, and sent into the field. The departments have received new rulers of his appointment. Repeated revolts against the new authority have been subdued, oftener without than with bloodshed. Gambetta seems always to have been where the supreme power was most needed. Now at Tours, now at Lyons, now at Bordeaux, now at Le Mans, his spirit has infused itself wherever inspiration might, mayhap, effect something against the fearful supremacy of the invader. He has struggled mightily and well for the republic which he proclaimed, and to the maintenance of which he devoted every energy of his being. He has done ill-judged things, probably very imprudent things; has possibly been curt and arrogant to hoary generals, and has seemed to show at times but little regard for the truth. But his course, as he looks at it, is twofold. He would preserve his country from disintegration and dishonor. He would establish in it a government of liberty. Much may be excused to such a man with such a cause. At least he has not been arrogant in wickedness, nor untruthful in the service of despotism. He has been heroic, even if we refer to the plane of heroism which is simple perseverance and persistency in pursuing an end. The difficulties which he has had to encounter seem to us, at a distance, and hearing only rumors and snatches of the truth afar off, gigantic; on the spot they are doubtless far greater than we know. His name and fame have already passed into history. Probably he will do nothing in the future which will make his past career more illustrious.

GEORGE M. TOWLE.

OUR NATIONAL GAME.

IN a recent essay on Chaucer, James Russell Lowell makes practical common-sense the distinguishing mark of the Saxon as compared with the Celt. The same quality, he says, pervades their religious views. It is this practical element, we think, that has modified the hard Puritanism of the eighteenth and beginning of the nineteenth century, and permitted an element of amusement to exist contemporaneously with true piety. And within a certain limit health has followed in the train of amusement. But a few years since, the hollow-cheeked countenance, "sicklied o'er with the pale cast of thought," was considered the necessary accompaniment of the scholar and the clergyman; happy was that parish whose minister had studied him-

self into dyspepsia. The lad who came home from college with healthy face and sunny disposition was adjudged to have done injustice to his studies. Owing to base-ball, university-rowing, and our Saxon element of common-sense, all this has changed. The social element of the country, restrained at first by the smallness of our villages, the extent of our farms, and a severe religious training, is now developing itself. Yankees are naturally gregarious, and meet in crowds wherever the occasion gives zest and interest. We love sport and excitement, especially when the element of uncertainty is thrown in. Base-ball, restrained within proper limits, is healthy, pleasant, social, and uncertain. It has passed from city to town, from town to village, till it has overspread the nation. A thriving town in the West is now said to have one church, one school-house, and eight base-ball clubs. It is as much our national game as cricket is that of the English. Both are ball-games, played with almost the same number of players. But cricket is slow and unwieldy, more likely to do injury, more scientific in its nature, more certain in its result. Base-ball is quick in its evolutions and renewals, gives more opening to dash and energy, depends somewhat on luck, and thus gives more chance for betting. And so the slow, dangerous, scientific cricket is the national game of England, and base-ball the favorite play on this side the Atlantic. Our national characteristics develop themselves even in our amusements.

Base-ball is not the game of cultured society. It has none of the delicacy of touch, the companionship of the friend, the expensiveness of the materials that distinguish billiards. It is gregarious in its nature and delights in crowds. The ringing cheer that marks the good catch, the groan that follows the muffin play, the hearty sympathy of the multitude, are essential elements in its composition. Hence it is the great game of the middle class. Every city has its favorite club that travels leisurely over the country every summer, paying its way as it goes, by the gate-money of its admirers. It is the play of Young America; and in its gamy pursuit, a prodigious amount of pluck and muscle have been developed. Occasionally twisted fingers and broken noses are the penalties paid for prominence in ball-playing. But what are these among so many benefits that accrue to our young men from their enthusiastic love of this science. To every player and to most lookers-on, base-ball is its own exceeding high reward.

The development of this game within the last few years shows some remarkable statistics. But a little more than a quarter of a century has passed away since the organization of the first club. Prior to that period, Two-old-cat was the euphonious name of the juvenile predecessor of our present game; a name and game whose hoary antiquity goes back to a time whereof the memory of boys ruaneth not to the contrary. It was in 1845, that the first club was formed, whose immortality of existence has been transmitted to posterity; and, formed in the great city of Gotham, it was of course christened as the Knickerbocker. That club was the parental organization of the present game; its children may be reckoned by thousands in all parts of the country. A second club was soon started in the same city, known as the New-York Club; and the first match game on this continent was played between them on the 19th of June, 1846. For the next ten years the clubs were few, but not far between, being almost entirely confined to the vicinity of New York. In 1856 the Knickerbocker Club inaugurated a movement for a convention of base-ball players, and in March, 1857, sixteen clubs, seven having their home in New York and nine hailing from Brooklyn, and all the other clubs in the country being nowhere, met in convention. In March, 1858, a similar gathering was held, at which twenty-five clubs were represented; and to this meeting came one club from a distance of thirty miles—the Liberty, of New Brunswick. And then and there "The National Association of Base-ball Players" drew its first breath of life.

The first ten annual meetings of this association were held in New York. But the game had now become national, and other cities desired the honors of the session. And so the meetings became peripatetic, and the eleventh was held in Philadelphia, the twelfth at Washington, and the thirteenth and last at Boston.

The nomenclature of the different clubs generally betrays a local origin. No doubt can exist where the Harvards, the Yales, the Cincinnati, the Keystones, the Forest Cities, the Nationals, the Marylands, the Niagaras, the Atlantics, and the Pacifics, have their baptismal homes. The Buckskins live at Gloversville, the Buckeyes at Cincinnati, the Southerns at New Orleans, and the Omahas at Nebraska. The Kicknapawlings hail from Pennsylvania, and the Ki-

kiongas from Indiana. The Unions may be found in every city. The Esculapian Club of Brooklyn is made up entirely of physicians; the ranks of the Manhattan in New York are recruited from the police force; the Malta Club of that city only admit milkmen. In short, every profession, every calling, as well as every considerable village in the country, has its base-ball club.

But the best base-ball clubs of the country—those that have won a national reputation—are no longer a collection of enthusiastic young men engaged in base-ball for the love of the game. That innocent stage has passed away. The leading players who really constitute the club—the picked nine—are professional players who join the club that gives them the highest salary. The rivalry of cities has degraded these clubs into collections of hired players, whose only interest is to win their pay by successful games. These Dugald Dalgettys of the profession enjoy salaries ranging from one thousand to twenty-five hundred dollars a year; and they draw those salaries with as much regularity as the salesman or the artisan. Every first-class player can now command a good living. All the best clubs of the country, the Red and White Stockings, the Atlantics, the Athletics, the Eckfords, the Haymakers, the Mutuals, are professional clubs; every player in them is hired. Emulous Chicago undertook last spring to form a club that should be superior to the Cincinnati; and prices immediately rose. The prospect for another year is that of a further rise; two of the best players in the country are understood to be engaged for the season of 1871 at salaries of three thousand dollars each for the eight months. These salaries are, of course, only given to pitchers, for on them, more than on any other, does the success of the club depend. A good pitcher is exceedingly rare; pitching is a grace born with the man, and not acquired by art. With an un-bent arm, held perpendicularly to the plane of the body, he is so swiftly to deliver the ball that the batsman shall be unable to detect the true line of its passage, and yet unable to decline it as a fair ball. Who will say that a person able to do this is not worthy of a salary greater than that of any university professor in our land! Is not the pitcher, too, a professor of muscular Christianity?

A well-located ground, level, grassy, and dry, is indispensable to a good game of base-ball. On its shady side should arise an amphitheatre of benches capable of seating three to five, and in our largest cities ten thousand spectators; for their sympathy and half-dollars are the great sources of inspiration. If there are trees contiguous to the field, they should be strong; for they will always have to bear a full crop of juveniles. The fence should be tight, and of that uniform height that riders-by cannot overlook. If knot-holes abound in the fence, they will come to a charitable use for those who cannot afford to pay. On one ground that we wot of, so highly civilized are the *gamins* of the neighborhood, that whoever first in spring writes his name over a knot-hole is entitled to its use all the games of the season! A well-located knot-hole is a source of profit as well as pride. It makes many an apple or penny change pockets during the season.

It is a prevalent opinion that the blind goddess of luck presides over most games; but this is a mistake. Good playing always tells; and luck will manifest itself as much on one side as the other. It was good playing that enabled the Red Stockings to win fifty-seven consecutive games in 1869. Their playing greatly varied. In the contest with the Buckeyes of their own city, the score stood 103 to 8; with the Mutuals of New York 4 to 2, and yet the same number of innings was played in both games. During 1869 the Red Stockings averaged 42 runs to a game; while their opponents, including the best clubs in the country, averaged only 10; no luck ever gave this superiority of four to one. Carelessness and muffin lose twenty games to one where luck predominates. If the number of runs indicated the superiority of the players, the Athletics of Philadelphia would be the champion club of the country; their playing in 1869 averaged more than 43 runs to a game. The Atlantics averaged 33, the Mutuals 31, and the Eckfords 28. The smallest score on record that year was that of a game played between the Atlantics and the Mutuals, when at the end of the sixth inning the score stood 2 to 1 in favor of the Atlantics. Two of the largest were made by the Athletics, standing 107 in one game, and 114 in the other. One of the largest scores on record was made by the Athletics in 1865, when they scored 162 in eight innings to 11 of the Alerts. This was the second game played that day by the Athletics, the forenoon having been spent in a friendly contest with the Williamsport Club, in which the Athletics made 101 to 8; 263 runs in one day! In the game in the afternoon, all the

bats of both clubs were broken, and in the last inning the handle of the nearest shovel was dignified into a bat.

It were an easy task to chronicle the causes of the national interest in base-ball; but one characteristic justifies its universal spread. More than any other game, it furnishes the solution of that important question, the extraction of the most health from a given quantity of amusement. "A healthy soul can only live in a healthy body," said the Greeks. *Mens sana in corpore sano* is so trite a Roman proverb that we hardly care to quote it. "By no other way," says Cicero, "can man approach nearer to the gods than by conferring health on men." And this divine gift is the very specialty of base-ball.

And not only is the game health-giving, but we point with pride to its moral influence. It is the conservative power of American society. While woman is soliciting office and demanding the franchise, base-ball clubs are only accessible to men. Whether this arises from that innate love of the graceful that would keep a woman from jumping loftily into air after a ball on the fly, or that catching in laps is forbidden by the rules of the game, or that the rapid running of the bases is inconsistent with the stability of chignons and water-falls, certain it is that there is no pressure on these clubs for the admission of the fair sex. Our female Canutes are told by the wave of base-ball now rolling over the land, "Thus far mayst thou go, and no farther."

WILLIAM R. HOOPER.

A MIDWINTER-DAY.

IT is more like the mid-day of some other season of the year, in this latitude of forty-two degrees, to-day. The air is soft and balmy; and the rich azure, which veils the whole landscape, lends the enchantment of Indian summer. This morning the sunrise filled our valley with unwonted splendor of purple and gold, and many of its rich tints still linger, as if loath to fade into garish day.

Where I am sitting—upon a mossy rock in the edge of a recent clearing of a thickly-wooded steep, where great fallen trunks of maple, chestnut, hickory, and chips of immaculate whiteness, are scattered all about me—I look over the soft, tufted brown of the meadows and hill-side-fields, from which the snow has suddenly vanished (save a faint line now and then, in a fence-shelter, like a swath of ripe grain), and over the woods to the distant mountain-range. A wood-chopper's axe, far off, beats time to my musings, like the ticking of a clock. There are faint sounds wafted hither from the little village down by the stream; and blithe chanticleer announces to the echoing hills that he has come forth with his admiring family to enjoy both the mellow day and whatever grubs may have the temerity to also accept the genial invitations of the weather. But his shrill voice reaches me in clear, inexpressibly musical vibrations, a little fainter than the mingled voices of a throng of school-children, at their romping sports. The sound from them, too—wrangling, singing, shouting—is blended in a pleasant rhythm; and the yellow school-house, by the brook, at the meeting of the roads, at this distance has strikingly the appearance of a little beehive in swarming-time. Two youths are skating upon the narrow white path of the stream, which winds its bright serpentine coil through the sear meadows. Their crystal bridge, despite the summer-like atmosphere, is a foot in thickness; for it is less than a week ago that our mornings were scored zero. Even the ring of their skates reaches my ear faintly; but a sweet silence pervades every thing near, save the softest murmur of content, which seems to throb under the gray leaves.

Is there any thing more beautiful—at least in winter-time—than a nook like this, canopied by hemlocks in the steep mountain-side, where the fantastically-piled rocks are all overgrown? The rank growth of summer no longer obscures and smothers this vegetation of mosses, ferns, and lichens. This is their summer. They are vivid with life, and luxuriate in an infinite variety of exquisite tints. What numberless shades of green, brown, red, yellow! Over the soft embroidered cushion of the mosses, the variegated ferns spread out their long fingers. The top of this ancient stump is a rare vase of lichens, and they fill every scar which the ruthless axe made so many years ago. Their tiny cups are brimming with scarlet drops. In such a spot as this, you are continually finding new forms of these cryptogamous plants, until you come to believe them altogether fantastic in

the shapes they take to themselves—holding to no arbitrary mandate of species; they seem to you infinite in variety, if you forget that they are all labelled with long, unrememberable combinations of vowels and consonants in some scientific folio. But the botanist can do little else than bestow these names on them, for they manage, by means of a little impalpable brown dust, to each keep its family line, with every hereditary trait intact, without flower or seed his microscope can detect.

The top of this tall ash-sapling—whose smooth gray rind is wound with a spiral coil—is bright with clusters of bitter-sweet, which are more like flowers than berries, for the orange-colored shell is parted, and opens like a corolla around the crimson berry. I find upon the ground a few of the singular pods of the *staphylea*, or bladder-nut, and some are still rattling upon the shrub. They are some two inches long, with a small, shiny seed or two in each of the triple compartments, thus kept dry for good reasons, no doubt, against sprouting-time. The witch-hazel flowers still hang in a rather dishevelled condition. They had their time of golden blossoming in November, so as to get an early start next spring, but in fruitage they will still be behind the chestnut, which blooms in June and July. Here are some of the curiously-speckled berries of the Solomon's seal, and the intensely bright scarlet ones of the jack-in-a-pulpit, or Indian turnip. There are many beautiful leaves, which, by closely hugging the breast of Mother Earth, will retain their freshness through the severest winter. None are more beautiful than the thick, heart-shaped leaves of the hepatica, with the bright purple of their under-sides.

But there is no end of the treasures one may find, by searching, under this warm mantle which the trees have shed. On my homeward way, across the fallow fields, I go well laden with some of these. One cannot go far, in whatever field of this region, without stumbling upon the little hillock where some industrious woodchuck has excavated his habitation. There is always the interest, to me, of mystery about these subterranean dwellings. I should like, wondrous well, to peep in on the family in the unrestraint of their domestic life. What secret of good housekeeping might I not learn? There is no sign of life now about the dwelling of this one, dipping under a huge boulder, which I have just come upon. But the lord of the castle is within, I know. How snugly he lies there, long-nighted, short-dayed months! I fancy that, in the vital kernel of that inanimate ball of fur, which Audubon says he rolls himself into, he is all the while dreaming the sweetest of dreams—living in the rankest, blossomest, honeyest clover, fenced about with delightful tumbled-down stone-walls, in which to play *bopeep* with phantasmagorical bipeds, who can never hit him with their shadowy guns, and where the wicked dogs cease from troubling. On some unazure day of "blues" I should not mind curling snugly down beside him there, to share his happy reveries—safe from dismal daily newspapers, and all report of wonderful nineteenth-century enlightenments, and where telegrams could not be delivered. One would "dig out," in the spring, as fresh as Adam emerged from the dust of the earth into Eden, with all the ills that flesh is heir to sloughed off. To have one's little life rounded with such a sleep! Ah, the thrill of that April morning!—to stand at the mouth of the hole, where the winter had been so sweetly dreamed away, upon one's hind-legs—I mean upon the minimum of support our unfortunate species is limited to—and behold the new creation of the earth; the bare, brown hills, and the leafless trees aglow in the light of expectation!

But this is not a day which can bring such longings; they will come soon enough when the mercury drops again—a plummet into the heart of this blandly-smiling Winter. The reality of this opulent mid-winter-day stirs sweeter currents by far in the soul than the most blissful dreamings.

MYRON B. BENTON.

THE BOHON-UPAS-TREE.

DURING the cruise of the United States ship Plymouth in the East Indies she visited the coast of Borneo, and there spent some time in regulating our commercial interests. While lying off the mouth of Bruni River, upon which is situated the capital city of Borneo proper, a party was made up to visit a upas-tree, which it appears is occasionally found in other islands than Java.

With a boat's crew well armed we left the ship at daybreak, in

order to accomplish the distance (twenty-one miles) before the sun came out in full strength. Reaching the mouth of the river after a pull of an hour and a half we landed to eat our breakfast, and, after resting the crew, put off again, arriving at our place of destination about ten A. M. We were all looking out eagerly for the realization of one of the wonderful stories that so fascinated our boyhood; but here were no barren wastes, or arid, skeleton-covered plains.

Following our native guide-boat we sheered in alongside of a grassy bank, the summit of which was laid out in small plots like children's gardens at home, each plot surrounded by a border of shells, with carefully-kept walks between them. Nothing but grass and flowers were growing there, but these were most luxuriant; for this was a graveyard, and we were even then standing under the shadow of the terrible poison-tree, near which these people bury their dead, which may partially account for the wonderful stories told by early travellers. The tree itself measured eleven feet in circumference five feet above the ground, and, instead of scattering death and destruction, was girted round with creeping vines and many-colored parasites that wound their way to the topmost branches, which were higher than any of the surrounding trees, and equalled, if not surpassed, those of our loftiest forest-trees at home.

An incision was made, after the manner of tapping maple-trees, and the sap, which is reported to be a deadly poison, commenced flowing drop by drop. It was of a yellowish-white color, thick and glutinous, resembling in its general appearance good rich cream. There was no unpleasant odor perceptible from it, nor did any of us experience any disagreeable sensations, though standing near by while the sap was being discharged. This was so slow an operation that it required nearly an hour to fill a two-ounce phial. Meantime it was desirable to procure some of the leaves and branches, but these were beyond our reach, as the lowest branch was at least a hundred feet from the ground, and, although the men could easily have climbed up by the vines, the surgeon in charge of the party refused to let them make the attempt, fearing that their hands and feet might become poisoned. At last, having loaded all our carbines with ball, a particular limb was selected, and we fired together, by this means securing several fine specimens.

Having obtained matter enough of all kinds to satisfy the demands of science, we returned to the ship, arriving on board at two o'clock in the morning, highly gratified by the result of our visit to this great natural curiosity which had been one of the wonders and mysteries of our boyhood.

H. W. DODGE.

A CAVALIER TO HIS SWORD.

(SEVENTEENTH CENTURY.)

COME, kiss my gallant sword,
And sprinkle it with wine;
This night it won its lord
A joy and hope divine!

Oft in these gloomy days
That cloud our stormy isle,
It earned a leader's praise—
To-night a woman's smile!

Behind its point, secure
Oft life and honor lay—
To-night it guarded pure
A richer prize than they.

Once did the steadfast blade
Our monarch's bulwark prove—
To-night the steel was swayed
To serve the queen of love!

With myrtle and the rose
Entwine it for the stroke;
In them it brighter glows,
Than decked with bay or oak!

JOSEPH O'CONNOR.

CLEARING THE SURFACE OF THE ICE WITH SNOW-PLOUGHS.

I C E :

ITS FORMATION, PECULIARITIES, AND USES—ITS COMMERCIAL VALUE AND IMPORTANCE—THE ICE-HARVEST, HOW GATHERED AND MARKETED.

“OBSERVE, my brethren,” said a grave English clergyman, to his hearers, in one of his sermons, “what a wise dispensation of Providence it is that great rivers should always flow past great towns.” In a similar spirit of profound philosophical reflection we may remark what a wise dispensation it is that ice should be solely or mainly a product of *cold* countries! If it were formed in the tropics, what quantities of it would be wasted, and how it would check the rapid growth of vegetation! There is, to be sure, sometimes a little superabundance of it in those Northern regions, where, from its commonness, it is not so highly prized as it should be; but the same thing is true of tropical products.

Our neighbors in Greenland, Iceland, and Nova Zembla (not to speak of Alaska, which is a part of our own homestead), are, we are sorry to say, sometimes inclined to complain of a superfluity of ice, when, from an unusually hard freeze, it exceeds twenty feet in thickness, and is too rough for sledging, and especially when, owing to the nights being dark, they cannot follow their favorite amusement of skating in a ring round the North Pole, or dance the German on the ice beneath the illuminations of the aurora borealis. It is, it must be confessed, a little awkward at times for our daring navigators in their ardent pursuit of whales to find themselves nipped between two vast ice-fields, and their vessels crushed like egg-shells, or to have a squadron of those grand old icebergs, two hundred and fifty or three hundred feet above the water, and at least two thousand feet below it, come sailing in among them, and paying not the slightest heed to the laws of the road. But, then, these things are good for the whales, and why should these whaling-ships persist in trying to catch the harmless monsters, when kerosene is so cheap and astral oil so widely advertised? It is evident that in this world the interests of classes must clash to some extent, and, if man has had his day, why should not the whale have his also, and enjoy the delights of his ice-clad home, undisturbed by harpoons, self-exploding bombs, or the other weapons of destruction, which have hitherto brought to light so much blubbering and spouting among these monsters of the deep? But it is ice, not whale-oil, that we undertook to write about.

Manifold are the uses of ice. It is an admirable thing to skate upon, when it is smooth, and there are no treacherous ice-glades or rotten ice to interfere with the sport. With the skilful skater skating is the very poetry of motion; the graceful curves, pirouettes, and intricate

figures, executed with such ease; the swift flight and pursuit; the evolutions by which the experienced skater avoids his pursuer, or, doubling on his track, becomes in his turn the pursuer—send a joyous thrill through the veins, and the man seems for a time changed into a winged creature, who can at will spurn this dull earth. If the skater be of the fair sex, and reasonably skilful in the art, her graceful motions and her well-arranged drapery add to the beautiful illusion, and she seems a swan skimming over the glassy surface, or a bird of paradise irradiating the scene with the brilliant yet harmonious tints of her plumage.

Ice is a grand antiseptic. On the banks of the Yenisei, the Obi, and the Lena, Siberian rivers, and the shores of the Frozen Sea, there have been found, within the last two hundred years, exhumed by exceptionally-protracted rains and thaws, great numbers of carcasses of the mastodon and other huge prehistoric beasts, which had been packed in ice probably many thousand years ago—what time those frightful beasts and beastesses, so vividly depicted in the Museum department of this journal, roamed the earth, and perhaps stored away for the prehistoric man to carve with his obsidian knives, chop with his stone hatchets, or crack their bones with his porphyry hammers; but alas, poor fellow! he failed of finding the contents of this grand refrigerator, and he and his wife and little ones were compelled to drag out a squalid existence on the meat of the wild-horse or the cave-bear.

The presence of so many of these huge creatures in a region so far north, denizens of a temperate if not a tropical climate—as from their habits they must have been—indicates with certainty the suddenness and completeness of some of those climatic changes which geologists describe, and which they attribute to a change in the inclinations of the earth to the plane of the ecliptic. The poor brutes must have been caught in a hard frost as they were disporting themselves in the stream—a frost so hard that they were fast locked in their icy bed, and, covered with the drift, borne down by the river-currents. Nor is this remarkable, if we believe the statements of Erman, the Russian traveller, who tells us that an attempt was made many years since to sink a well near the mouth of one of these rivers, and that the workmen employed found alternate layers of gravel and clear solid ice to the depth of five hundred and eighty-two feet, indicating that the internal fires had not made much progress in thawing out that part of the planet.

Mankind are exceedingly stupid ; whether they grow more or less so, as the ages roll on, is a mooted question. It would seem that, from this demonstration of the antiseptic and refrigerating power of

us in their perfection, from any considerable decay for months, or even years.

The same antiseptic quality of ice enables us to preserve, by means

of it, the remains of our friends from too speedy decay while awaiting the last sad rites of burial. Of its uses, resulting from this quality, in medical and surgical treatment, we shall speak farther on.

Some of our readers may think that it is hardly necessary to say that ice, like some of the parties who deal in it, is decidedly cool ; and yet this very quality of coolness is what gives ice its principal value. Without the addition of its cooling property, the Croton, the Ridgewood, and possibly even the Cochituate water, would be, in the middle of the present century, that there was a great, useful, and profitable lesson to be taught by this sudden uncovering of food thus preserved for ages. We know now, thanks to the enterprise of American inventors and discoverers, that it is not only possible but easy to transport carcasses of beef, mutton, pork, and venison, killed on the plains of Texas, at the foot-hills of the Rocky Mountains, or on the Pacific slope, and much more in the States of the Mississippi Valley, in refrigerating cars or ships, where the temperature is reduced to 34° Fahrenheit or below, by means of ice-packing, to the Atlantic coast, or, for that matter, around the globe. The effort is now making to bring beef from the South-American pampas, and mutton from Australia, in the same way to our markets, and, if it fails, it will not be from lack of antiseptic power in the refrigerating chambers of the ships, but from the inferior quality of the beef and mutton, and the defects in the proper methods of packing.

By an analogous process of refrigerating chambers in steamships, or refrigerating houses in our cities, it has been demonstrated that it is possible to preserve our own fruits, and the delicious grapes, oranges, lemons, guavas, pomegranates, bananas, and other tropical fruits, which hitherto have never reached

summer at least, flat, stale, and unprofitable. What would the vendors of soda and mineral waters, of root and medicated beers, lager-bier, and similar beverages, do without ice to make their otherwise often distasteful drinks cool and palatable? Who does not know that the delicious coolness imparted by ice to more potent stimulants, the iced champagne, milk-punch, sherry-cobblers, mint-juleps, and the thousand other concoctions by which alcoholic liquors are disguised and rendered palatable, is the cause of the very great increase in their use? The confectioner's art, too, is greatly indebted to this gelid

quality of ice, for many of its most popular preparations, the ice-creams, fruit-ices, and other summer confections, owe their toothsome-ness largely to the presence of ice in them.

In the latter part of the last century and the early years of the present, wealthy citizens in the country often built ice-houses on their grounds and filled them during the winter from some spring, pond, or stream, near by, for use during the summer months ; the small farmers and less wealthy

classes were fain to use some cool spring or a deep well, if they had one, as their refrigerator. In the cities ice, seventy years ago, was a rare and precious luxury ; and various were

GROOVING THE ICE.

SAWING THE ICE AND BEARING IT OFF.

the substitutes devised to answer its purpose. The butchers and butter-dealers usually had small quantities brought from some ice-house at a distance, but the citizens generally could only rely on cool cellars and pump or well water. Now, in the large and small cities and most of the larger towns, every family has its refrigerator, and receives its daily or tri-weekly supply of ice during the warm season, and ice has become no longer a luxury but a necessity to those myriads of households.

In the threatened ice-famine of the summer of 1870, though the price to which ice advanced caused a very great decrease in its consumption, still there were thousands of families who would have as soon abstained from the use of meat as of ice; and to many of them the enhanced price was as real and as cruel a hardship as the quadrupling the price of bread would have been.

It remains that we should speak of the use of ice for medical and surgical purposes. This, like most of its other economical uses, is for the most part of recent discovery and application. For arresting hæmorrhage and allaying pain, by its benumbing influence, in surgical operations, ice is one of the best and most efficient appliances of the surgical armory; it is also used to some extent in the treatment of

reaches the temperature of 39° , water, in giving up portions of its latent heat, contracts, though very moderately; between 39° and 32° (the point of solidification), it expands about eleven per cent., or one-ninth of its previous bulk; and this expansion is so irresistible as to form an explosive force nearly equal to that of gunpowder, calculated by physicists at twenty-seven thousand seven hundred and twenty pounds to the cubic inch. The reason for this departure from the general law in the case of the solidification of water is obvious, though it has never, so far as we know, been adduced as among the evidences of design on the part of the Creator. If water, like the oils and the mineral salts, became heavier when it became solid, it would sink to the bottom of the lake, pond, or stream, on which it formed, and the successive layers of ice formed in a cold season sinking as they congealed, the body or stream of water would be wholly solidified, and would only become liquid again after a long season of excessive heat. This would lead to the destruction of the finny tribes which inhabit the waters, to the diminution of the evaporation from their surface, and the consequent diminishing of the rainfall; to a lower mean of animal temperature, backward seasons, and small and imperfect crops. The regions where the ice sunk as it froze would soon become a bleak

DRAWING THE ICE-BLOCKS TO THE ICE-HOUSE.

aneurisms, and sometimes in encephaloid tumors. In medicine it is, in judicious hands, one of the most valuable and potent articles of the *materia medica*. It is used in the treatment of inflammation of the brain, inflammation of the stomach or intestines; in the discussion of inflammatory tumors, carbuncles, etc.; in the treatment of cholera, yellow fever, and metritis; as an application to the spine, in spasmodic diseases, and in inflammation of the spinal cord or its membranous coverings; in mania-a-potu, and delirium tremens, and in various other diseases, characterized by excessive excitement of the circulatory system. It ranks among the best remedies in the hands of the profession; yet, though it may be considered valuable for both internal and external use, it is not, like the much-vaunted salve, to be used "externally, internally, and eternally." In midwinter, with the thermometer at zero, it must be a fierce fever or inflammation which will require a very free use of ice; but, amid the inflammatory diseases of the summer months, it is not only beneficial, but generally very agreeable to the patient. Ice has its peculiarities. While chemically it is only crystallized water, we find, in investigating the circumstances of its congelation, some things which surprise us, or would, if we gave them thought. The freezing-point of fresh water is said to be 32° Fahr.; yet, if the water is kept perfectly still, and nothing is thrust into it, the temperature may fall to 15° , or, as some chemists assert, to 5° before it congeals; the moral to be drawn from which is, "Keep still if you do not want to get into a fix." Another of its peculiarities is that, while most liquids contract on assuming the solid form, water expands. It does this, however, only within certain limits. Till it

and barren desert. Under the existing natural law the water beneath the ice retains a temperature not below 32° .

Another peculiarity of ice is its greatly increased density and tenacity under protracted and severe cold. Most liquids, on assuming the solid form, retain that form, without material change, so long as the temperature remains below the point of liquefaction, a further decrease of temperature effecting no perceptible difference in their density; but the ice, formed at a temperature of 25° to 30° Fahr., is as different from that which is found when the temperature has ranged for some time between 10° and -10° Fahr., as chalk is from granite. The ice at the lower temperature is dense and hard as a flint; it strikes fire with the pick or the skate, and, as in St. Petersburg, in 1740, when masses of it were turned and bored for cannon, though but four inches thick, they were loaded with iron cannon-balls, and a charge of a quarter of a pound of powder, and fired without explosion.

Still another peculiarity of ice is that in the process of freezing the impurities (salts, etc.), held in solution in the water are eliminated, and only the pure water takes on the crystallized form. This is a very important fact, and is often made use of by practical chemists in concentrating tinctures, vinegar, alcoholic preparations, etc., by freezing out the water which they contain.

The ancients gathered snow, and packed it in caves and pits, for use in cooling the water and wine which they drank, and even the nectar of the gods was said to be cooled by snow from Mount Olympus. The Italian peasants still gather the snow from the Apennines, and pack it in caves and pits; and in Naples, Rome, and Flor-

ence, there are numerous snow-shops, where this soiled and impure snow is sold during the warm season. Mr. W. J. Stillman, late United States consul at Rome, attempted a few years since to introduce American ice there, offering the pure Wenham-Lake ice at the price the people were paying for this dirty snow; but he was informed that it could not be permitted, as the right to gather and vend this snow was a vested right of the Italian peasants, and must not be disturbed.

The ice business has grown up from small beginnings to be one of the largest of the minor industries in this country. It employs a capital of not less than twenty million dollars, and the aggregate sales of ice are somewhat more than thirty million dollars. Forty years ago the capital invested was less than one hundred thousand dollars, and the aggregate sales not more than one hundred and twenty-five thousand dollars.

There are now in New-York City five or six ice companies, with an aggregate capital of nearly four million dollars. They will market in average years about a million tons of ice, supplying not only New-York City, but Brooklyn, and the other towns and cities of Long Island, Staten Island, Westchester, and the cities and towns of New Jersey adjacent to New York. Nearly one hundred thousand tons are exported to distant cities and foreign countries.

These companies have their ice-houses at between thirty and forty points on or near the Hudson River, and at such lakes as are accessible by railroad, and within convenient distance of the city. These ice-houses have an aggregate capacity of about a million tons, but some of them are filled more than once a year, the sale continuing to a moderate extent throughout the winter months. They will employ the coming season about forty barges of from four hundred to eight hundred tons each, five steamers, nearly three hundred wagons, about five hundred horses, and seven hundred men. In the summer of 1870 the prices of ice

were, to the large hotels and packing-establishments, seventy-five cents per hundred pounds; to butchers, druggists, and the larger grocers, one dollar per hundred; and to families and small consumers,

from one dollar and fifty cents to two dollars per hundred pounds. Even with these exorbitant prices, which the companies justified on the ground of a threatened scarcity of ice, there was great, and, in many instances, just complaint of short weight and frauds in the delivery. This was undoubtedly often the fault of the drivers, who made a considerable daily profit in selling to others than their regular customers; but their delinquencies were overlooked or very leniently treated by

the managers themselves, and there was some reason to believe that some of these participated in the fraudulent gains.

The export of ice to foreign countries had its origin at Boston, within the present century, and has only attained to any considerable importance within the past thirty-five years. It has been stated, jestingly, that Massachusetts had but two agricultural crops for export, granite and ice; but she has made both the sources of great profit to her. The ice-crop, however, was not discovered as an article of export till 1805, when Mr. Frederick Tudor, of Boston, sailed in his own brig, with a cargo of one hundred and thirty tons of ice, for Marti-

nique. Much of this melted on the voyage, and the remainder sold slowly and only at a loss; but Mr. Tudor persisted in the business, though without profit, till the War of 1812 commenced, and for the time put an end to the trade. In 1815 Mr. Tudor obtained some exclusive privileges from the Cuban Government, and between 1817 and 1820 began to send cargoes also to Charleston, Savannah, and New Orleans. But he

met with frequent disasters, and often, from long passages, lost the greater part of his cargoes. As late as 1832, his whole shipments for the year amounted to only forty-three hundred and fifty-two tons, all of which was taken from Fresh Pond, in Cam-

ELEVATORS AT THE ICE-HOUSE.

STORING THE ICE.

bridge. In 1833 he sent his first cargo to the East Indies. Of one hundred and eighty tons shipped, eighty melted on the passage to Calcutta, but what was left sold promptly at a remunerative price. From this period the business began to thrive. In 1836, the exports from Boston were twelve thousand tons; in 1846, sixty-five thousand tons; in 1856, one hundred and forty-six thousand tons; in 1866, nearly two hundred and fifty thousand tons. The export from the Northern ports is now in all about five hundred thousand tons. A very considerable amount is sent to British and Continental ports, and large quantities also to Brazil and other South-American states. About two hundred thousand tons are sent from Boston, Portland, Bangor, and New York, to the southern Atlantic and Gulf cities. Immense quantities of ice are harvested every year from the great lakes, not only for the supply of Chicago, Detroit, Buffalo, Toledo, Milwaukee, and other lake cities, but to send to Cincinnati, Louisville, St. Louis, Memphis, New Orleans, and other cities and towns of the Southwest.

The gathering of the ice-harvest is a lively and stirring season. We have already said that the supply of ice for the New-York market comes mainly from the Hudson River above tide-water, from the coves, bays, and inlets along its shores, and from the small and pure lakes near to the river, or to some one of the great railroad routes leading to the metropolis. The Boston supply, both for home consumption and export, is derived from several lakes at no great distance from Boston; that of Portland and Bangor, from the Kennebec, Penobscot, and Androscoggin, above tide-water, and from some of the lakes of Maine. In the West, the great lakes, and the smaller lakes of Wisconsin, Minnesota, and Michigan, yield an unlimited supply. The ice-houses are huge buildings, from one hundred to two hundred feet in width, and from two hundred to four hundred in length, generally of wood, though sometimes of brick, with double, triple, or quadruple walls, the interstices usually packed with some non-conducting substance, such as spent tan-bark, sawdust, etc., with doors closing tightly on each floor, but no windows, and with inclined planes, movable, and adapted to each story, without as well as within, and, in the case of the larger ice-houses, a steam elevator is employed to drag the blocks up the inclined planes and lower them on the inside.

A favorable time having arrived for storing the ice, after a considerable period of severe frost, the fields are temporarily fenced; the snow, if there is any, is scraped off by a broad scraper, drawn usually by one horse, and the ice planed by another scraper, armed with a steel blade, to the depth of two or three inches, to remove the porous ice. Then comes the marker, a sort of plough which cuts a narrow groove, perhaps three inches deep, drawn by one horse—for, in this harvest, the ploughing and reaping are done the same day—and, when the marker has run a series of parallel lines five feet apart, it is turned the other way and crosses these with other grooves, also five feet apart. These grooves are deepened, and the size of the blocks reduced, by a sort of harrow, with three or more parallel rows of long and sharp teeth, about two feet apart, one row running in the grooves already made. Sometimes another plough, with a long, sharp, and comparatively thin tooth, or blade, is run through the principal grooves, if the ice is very thick. One row of the blocks is then cut through to the water underneath, by means of handsaws, and these blocks are hauled up on the ice adjacent, and run to the inclined planes, or loaded on sleds. The work now begins to be lively. As it is always uncertain whether there will be another favorable time for housing the ice, all hands drive their work as rapidly as possible. One gang, armed with crow-bars, thrust them into the grooves, and pry off the blocks; another catch them with a kind of spear and hook combined, and drag them into the canal formed by raising the blocks already described. Others attach to a sheet of perhaps fifty squares, a grappling-iron, with a long chain, and it is towed by horse-power toward the ice-house, either through the water, or, one end being tilted, it is raised on the icy surface and dragged swiftly to the elevator. Here, in blocks of five feet square, or smaller if desired, it is run up the inclined planes by the elevator and lowered on the inside, men being ready to receive it and pack it, standing on edge, with layers of sawdust, shavings, rice hulls, or spent tan. One story or floor being filled, the sliding-doors are closed, and the next floor above is stowed in the same way, gutters and drainways near the walls receiving and carrying off the drainage and water from the melting of the ice. The houses, as fast as filled, are closed as tightly as possible, and they are only opened as the ice is wanted for immediate consumption. During this harvest season—which seldom lasts more

than four or five days at a time—if there is moonlight, the work is often continued through the night as well as the day, and the scene is an animated and beautiful one. The men and animals seem stimulated to the utmost exertion, and all work with a will; at some of the houses of the Knickerbocker and Washington Ice Companies, six hundred tons are housed in an hour. Ice is too perishable an article, in warm weather, to bear many handlings. If wanted for export, the vessel to be laden comes, if possible, to the ice-house, and receives its cargo with but a single handling. The shippers have usually, at the port to which they are bound, a suitably-constructed ice-warehouse, where the cargo can be stored till sold; but each transfer is attended with heavy loss from melting. If the ice is intended to supply the city trade, it is loaded on the barges, which are peculiarly constructed for this business, and a half dozen or more of them are towed down by a steamer (barges and steamer being both owned by the company) to the company's docks, and either stored in their city warehouses, or, if the demand is active, loaded immediately upon those huge, heavy wagons which shake all the houses on the street by their jarring thunder. In an average season, the net cost to the company of the ice ready for delivery to the customer, does not much, if at all, exceed three dollars per ton. When there is a scarcity of the commodity, and the company are obliged to supplement their own stock by purchases from Maine or elsewhere, this cost may be doubled; but this is very rarely the case. The average price to the consumer, of the three classes already named, during five years past, has been about eleven, thirteen, and sixteen dollars, the average being considerably increased by the extraordinary high prices of the last season. The competition from the organization of new companies, and the pressure to sell the vast quantities of ice stored during this very favorable season, will probably materially reduce the price of this commodity to our citizens, but will be very certain to increase largely the quantity exported to foreign countries. In 1870, prices at home ruled so high as to render foreign exportation comparatively unprofitable, and it had accordingly fallen off to about sixty-three thousand tons. The home market, in fact, is much the largest and most certain. In 1856, New-York City consumed and shipped two hundred and eighty-five thousand tons of ice. In 1866, the supply was four hundred and fifty thousand tons; in 1871, it will exceed one million tons. Very few branches of business have had so rapid a development.

UNCLE SAM'S STRONG BOX.

THE Treasury Building in Washington covers three acres. Built of granite, after a Grecian model, its pediments shaped upon the spot, and its pillars monoliths, its length and breadth in true proportion to its height, and its ornaments and fittings, fountains and gardens, approaches and esplanades, corresponding to each other and to the whole—it is, perhaps, more nearly perfect than any other public edifice in America.

Within its walls are the offices of two cabinet-ministers and eleven heads of bureaus. There are chiefs of divisions, comptrollers and their subordinates, auditors of claims and accounts, printers of the currency, women who copy, and men who revise, mechanics and laborers, messengers and watchmen, operatives and their superintendents, cunning artificers who engrave and deft experts who examine—including, all told, fully three thousand souls. Of the complex working of this vast living machine, of its wheels within wheels, of the grades of office, payments for services, and specialties of divisions, I do not purpose to write. I wish simply to describe one bureau—that of the United States Treasurer, the depositary and guardian of the people's money. This office, the Treasury proper, occupies the place of honor in the building, the principal entrance in the magnificent new north front leading directly to it. Entering, the visitor's eye is attracted by an inscription, "The United States Treasury." This is over the door of the cash-room, one of the finest business rooms in America. A gallery opening from a corridor in the second story—for the cash-room comprises two stories in height—affords the visitor a view of the interior. It is seventy feet long by thirty broad. The floor is of marble; marble columns with exquisitely-wrought capitals and bases sustain the ceiling, and panels of the same set in frames of a different hue form the sides. The walls alone cost sixty-five thousand dollars, and the bronze railing, of beautiful design, enclosing the gallery, cost twenty thousand.

Descending, and passing through the cash-room to a corridor near by, one sees huge iron panels which appear to form part of the walls. They extend from floor to ceiling, and bear heavy mouldings. In the centre of each is the national shield, and the letters U. S. These panels form one side of the great vault—"Uncle Sam's" strong box. I had imagined the government treasure hidden away in some remote underground cell, as if it were the hoard of a miser, but the money-vault opens from a frequented corridor, receiving abundant daylight from one of its broad windows. The assistant treasurer, kind and obliging as he is efficient and faithful, bids us enter. It is a room about twelve feet square, with little in appearance to indicate its character or purpose. No imposing display of strength impresses the visitor. The barriers of iron and depths of granite which stand between millions of treasure and the midnight torch or burglar's implements, are concealed behind light wooden cases, such as might belong to a housekeeper's linen-press. The echo of his footstep on an iron floor, and the ponderous door with its huge lock so fearfully and wonderfully made, are all that remind him that he is within the fortress of a nation's wealth.

The doors of the cases opening, one sees canvas-bags tossed carelessly in heaps. They contain one hundred million dollars in gold. Here are two hundred thousand dollars which were taken from Jefferson Davis, at the time of his capture. The total value of money now in the vault is four hundred millions. Huge packages of greenbacks, fresh from the engravers' hands, cut and signed, are stored away ready for circulation, and box upon box filled with fractional currency load the shelves.

Near the money-vault is another, similar in appearance and surroundings. Its walls are lined with pigeon-holes. These are filled with envelopes containing bonds sent here by national banks as security for their circulation. The largest deposit is that of the Bank of Commerce of New York—seven and a half millions, the annual interest upon which amounts to over four hundred thousand dollars. Sixteen hundred and ninety-five banks are represented. No other deposits are kept.

The daily receipts of the Treasury, from assistant treasurers, and from all sources, are placed in the money-vault. There are seven sub-treasury offices tributary to this—at New York, Boston, Philadelphia, St. Louis, New Orleans, Charleston, and San Francisco. The transactions of all these offices are daily reported here to the Treasurer of the United States.

An important branch of the Treasurer's bureau is the redemption division. Each mail brings to the department hundreds or thousands of dollars in worn-out currency. It is taken in by banks and post-masters. When received at the Treasury, an account is first made of it, when it is sent to the desks of the female clerks, of whom there are one hundred and eighty-three in this bureau. When smoothed out, carefully examined for counterfeits, and recounted, the bills are done up in packages, each consisting of notes whose value is expressed by a multiple of one hundred. A paper-band is pinned round either end, upon which is written the name of the clerk who counted it, and the result of her count. Its equivalent is there made up for the bank or post-office transmitting it, in fresh new currency. Should counterfeits have been sent, they are deducted, branded, pinned suggestively to the letter acknowledging receipt, and returned. The packages of worn-out notes are next taken to a machine which punches a hole in both ends, and then to a cutting-machine, which divides them in halves. These halves are packed in separate boxes, one box going to the office of the Treasurer, the other to that of the Register of the Treasury, where they are counted for the third time. If the result be the same in both offices, the count is supposed to be correct. The notes are then burned, and the Treasury is at liberty to issue new ones in their places.

This burning is quite a formal affair. If Treasury notes (greenbacks) are to be destroyed, the burning is presided over by four officials—one each from the office of the treasurer, register, and secretary, and some person outside the bureau, who is appointed by the Secretary of the Treasury. If the destruction be of national bank-notes, the fourth witness is selected by the bank directors. These witnesses are present to see that the money is actually burned. Filthy lucre, literally and figuratively, it is. Any thing else except money, half so nasty, would be spurned in disgust.

Many of the women engaged in the redemption-bureau become exceedingly expert in detecting counterfeits, matching fragments of notes,

and counting currency. The ends of their fingers are educated to such a degree of sensitiveness that they discover counterfeits simply by feeling. A gentleman who, I think, must have been slightly jealous of this new competition in the labor-market, said: "No wonder they count money rapidly, they are so light-fingered." But their superior officers bear witness to the fact, not only that lightness of fingers enables them to count money rapidly, but that they possess a quickness of perception by which they count with fewer mistakes than men. It seems hard, though no doubt necessary, that if, in spite of their carefulness, a counterfeit *does* escape their facile fingers, or an error occur in their reckoning, they are obliged to make up the loss from their own pockets. New clerks often lose considerable sums in consequence of such mistakes.

The proverbial patience of women is put to excellent account in this bureau. Packages of money occasionally come for redemption which have suffered shipwreck, and lain, perhaps for months, under water. Many there are, of course, torn to fragments. Color has disappeared from backs and faces. The fibre of the paper is gone. To touch is to destroy them. What was done with these sorry bits before government employed women, I do not know. Imagine the pulpy, half-macerated masses sent to the desk of a man! Do you not think they would be emphatically pronounced worthless, and the whole lot consigned to the fire forthwith? The lady clerks have undisputed monopoly of this sort of business. They patiently sit down and pick out, bit by bit, the crumpled, faded fragments, smoothe them, match the pieces, paste them on a new back-ground, and, in most instances, restore them in such degree that the denomination can be ascertained, and their owner saved a loss.

Notes which have been damaged by fire are treated in the same manner. Charred and blackened inside some safe which has survived a conflagration, so thin that a breath would blow them away, or a touch reduce them to ashes, one of these expert clerks, nevertheless, with her delicate fingers, fits the tatters together, and so arranges the ashes that the figures appear again, though in shadow, dimly yet incontrovertibly attesting the fact that such notes have once been issued.

Occasionally it occurs that persons who have defrauded the United States Treasury are troubled in conscience, and prompted to return stolen money. An account is kept of all such receipts. Somewhat over one hundred thousand dollars have come back within the past six years, and been placed to the credit of the sinking fund. Imagine the repletion of the United States coffers, were a spasm of remorse to convulse delinquent army contractors into restitution of their ill-gotten gains!

An account is kept of all moneys received at the Treasury—by whom it comes, for what purposes, whether customs, taxes, sale of lands, internal revenue, or loans. A similar account is kept of moneys paid out—whether on account of public debt, army, navy, diplomatic and department officers, or miscellaneous expenses. The business done is, of course, immense. A sight of the archives only bewilders. Vast corridors in the basement are lined with cases; every letter received is filed away; and of every official communication sent, the number of which amounted to one hundred thousand last year, a duplicate is kept. There are huge registers in which every letter is classified, so that, if called for, it is forthcoming. There is no confusion. Mistakes are unknown. System makes every thing perfect, even to the minutest detail.

The public crib is supposed to offer peculiar facilities for speculation; yet it is officially stated that, during the eight years since the present treasurer came into office, not a cent has been lost to Government, either through the incapacity or misconduct of any of its servants in this bureau. Slight mistakes have occurred, but the loss resulting has been made up by persons responsible for them, or by their fellow-clerks. This fact is the more remarkable, inasmuch as these eight years include four of the war, during which the amount of business was increased twenty-fold. We must conclude that Government has been more fortunate in the selection of its cashiers and tellers, than banks throughout the country. Hardly a week passes but the newspapers bring us stories of defaulting presidents, runaway cashiers, or thieving tellers; yet, from the United States Treasurer's office, not a cent has been stolen for eight years. No wonder the head of this bureau is chosen treasurer of charitable and patriotic associations! No wonder he is considered indispensable to the Administration, and that, during the last quadrennial scramble for office, no man had the audacity to ask for his place!

LAURA M. DOOLITTLE.

TABLE-TALK.

THE question of rapid transit between the upper and lower extremities of New-York Island is revived again this winter, with interest strengthened by the ever-increasing necessity of some method by which the heart of the city can be reached more expeditiously than now. We imagine this great desideratum to New-Yorkers has been delayed in consequence of so many divided and contending projects. The interests so deeply concerned in the matter do not unite upon any definite principle, and so far nothing seems to have been settled, excepting an admission as to the cardinal necessity of a plan of some sort. Whether the road shall be an underground road, a sunken road, or an elevated road, still remains a matter of dispute, and each project has its clamorous and persistent faction. It would be well, before charters are granted, or any thing done tending to commit the government or the people to any particular plan, that a searching inquiry should be made into the feasibility of the various methods proposed. Is an underground road practicable? Is it likely ever to have travel enough to pay interest on its great cost? What has been the success of the underground system in London? Of the two methods now in operation in that city—the underground and the viaduct—which is the more successful? A commission should be sent to London to ascertain all these things. It is quite unnecessary for the people of New-York to go blindly experimenting in so important a matter, when they have full opportunity to investigate the practical operation of two distinct systems. An English engineer has recently given us assurance that the viaduct roads in London are far more profitable and more popular than the underground lines. The underground roads, although making small dividends for the present, as sort of bribes to keep up the courage of the stockholders, are scarcely paying expenses. The viaduct roads, on the contrary, are doing exceedingly well. If these statements are correct, and we have reason to believe they are, they ought to aid us here in solving the problem which has so long vexed us. If a conviction should spread that an underground system is impracticable or unadvisable, and all the interests unite in agreeing that the road must be an elevated one, we should then, probably, soon reach an agreement as to whether a viaduct system, running through the centre of the blocks, and built on arches, or a simpler elevated track, something after the manner of the Greenwich-Street road now standing, should be the design. The failure of the Greenwich-Street road gives prominence to the viaduct plan. This method seems to us to meet more nearly than any other the requirements of such a road. Built on arches of great massiveness and strength, it would admit of the highest rate of speed. Running midway between the avenues, through the centre of the squares, it would occupy no space now employed for ordinary traffic. Crossing the streets that are at right angles with it on high and enclosed viaducts, there would be no disturbance of any kind to the

travel below. The cost of such a road would be partly relieved by the uses to which the spaces beneath the road could be put—which in some quarters could be leased for storage, and in others for ordinary business purposes. But, whether this plan be adopted or not, it would hasten the consummation of the great need if all question of an underground road could be eliminated from the problem. Ordinarily we prefer to see enterprises of this character accomplished by private effort; but it would seem, in this case, as if greater success would be assured if the matter were referred to a commission, and made a State affair.

— The siege of Paris by the Germans, in 1870-'71, will undoubtedly take rank among the most celebrated events in the annals of mankind. It has, indeed, few parallels in history, and those only in the remote past. Very seldom has a city of such magnitude, filled with a warlike, well-armed, and determined population of millions, been assailed by a force numerous enough to invest it completely, and to hold at the same time the besieged in check, together with great armies organized for their relief in the yet unconquered provinces. The sieges of Nineveh, by the Medes (B. C. 606); of Babylon, by the Persians (B. C. 538); of Carthage, by the Romans (B. C. 146); of Jerusalem, by the Romans (A. D. 70); of Rome, by the Goths (A. D. 410); and of Constantinople, by the Turks (A. D. 1453)—are those which most resemble that of Paris in magnitude and importance, if we except the less known, and to us less interesting, sieges of the great cities of Eastern Asia. In Nineveh, Babylon, Rome, and Constantinople, it is possible that the besieged population may have equalled that of Paris. Of the number of their besiegers we know little except in the case of the Turks, who invested Constantinople with an army about as numerous as that which has just reduced Paris. All these famous sieges, like hundreds of others in history, were successful. In fact, it is almost certain, from the perfection of modern military science, that any city invested and besieged must eventually surrender unless relieved from the outside. For Paris there has been no real hope from the beginning of the siege. Its result was determined beforehand by the surrender of Sedan, and still more by the surrender of Metz—capitulations which deprived France of nearly all her regular army, and, still worse, of nearly all her capable and experienced officers, and left her defence to the hands of raw levies with unskilled commanders. The French armies in the field were insufficient to cope with the Germans who were not needed for the siege of Paris. The attempt to carry on the war after the catastrophe of Sedan, and especially after the still greater catastrophe of Metz, would never have been undertaken by a regular or legitimate government. The prolonged and ruinous resistance of France and of Paris was the work of adventurers with every thing to gain and nothing to lose by the continuance of hostilities. So long as the war continued under their usurped rule, they were princes and great personages, inhabiting palaces, exercising power, and controlling vast sums of

money. Peace to them meant abdication of their authority, and speedy return to obscurity and poverty. They, therefore, stimulated the people to resistance by false reports and baseless hopes, and the people—brave, patriotic, and high-spirited, though fearfully ignorant—responded vigorously, and, both in Paris and in the provinces, have made a very gallant and heroic struggle without the slightest chance of success. The result is exhaustion, devastation, and anarchy. It will take France a generation to recover from the merely material losses of the war, and perhaps as long to recover her moral tone and her power of self-government. At present she seems plunged into a political chaos, out of which no one can predict in what shape she will emerge. One lesson she has assuredly learned, and that is, not to make war upon Germany without provocation. For years to come, perhaps for ages to come, she will doubtless remember this salutary lesson, and let her powerful neighbor severely alone.

— Mr. Edwin Forrest is now playing at the French Theatre an engagement which will probably be his last in this city. It is fully fifty years since Mr. Forrest made his first appearance as an actor, and more than forty years since he attained a recognized position as at the head of the American stage. At eighteen years of age Forrest began his dramatic career; at twenty-six he had reached the highest point in his profession. Since then his career has, in one sense, been uniformly successful; he has made much money, and he has always addressed a large circle of admirers. But he has not quite retained the place in popular affection that he once possessed. There are various reasons for this, some of which do him honor, and others his enemies remember, while his friends extenuate. Mr. Forrest's temper has not been conciliating. He became involved in domestic difficulties, in which his cause was so managed that, while actually in the right, he was made to appear in the wrong. He quarrelled with Mr. Macready, the great English actor, without taking pains to be in the right. And, whether in the right or the wrong, he has invariably so scoffed and scorned the public press that he long since converted nearly the whole host of dramatic critics into enemies. Proud, reserved, somewhat bitter, Mr. Forrest so rebelled against those wiles and intrigues that make popular opinion that he carried his virtue to a vicious extreme, and forgot the ordinary amenities of life. These things have raised against him a formidable host, and have been the means, indirectly, of leading to a depreciation of his genius as an actor. It has become the fashion in America of deriding and underrating the one distinct American exponent of dramatic art. It has gone forth as a dictum that Forrest is a physical actor, a coarse actor, a rude, uncultivated actor. He is of so large and massive a make that, in one sense, he is a physical actor, and, no doubt, some of his effects are enhanced by or derived from this circumstance; and that some of the characters that he plays have a rude charm to the multitude, on account of his splendid presence, cannot be denied. But those who say he is not an intellectual actor do not judge, we think, correctly. We venture

to assert that he is the closest student now on the stage. Mr. Forrest, old, massive, infirm, is very far indeed from the ideal of Hamlet; and yet, those who can study the rendition of a part on its intellectual plane, without regard to physical advantages or disadvantages, must admit that the Prince of Denmark has no representative who brings to it a more scholarly taste. The readings of the soliloquies are exceedingly beautiful. Mr. Forrest is, like some other actors, more satisfactory in his level talking than in his passionate outbreaks. In colloquial delivery, he is simple, yet rich in every grace of true elocutionary art. In the soliloquies of Hamlet, his musing, abstracted utterance of those famous passages has the highest excellence. They are spoken with entire conception of their meaning, and every line is the result of a study far closer than our young actors have any conception of. Taking the single part of Hamlet as a test—and there can be no better—we believe every unprejudiced mind capable of judging will admit that Mr. Forrest's rendition of the part is, intellectually considered, in advance of all others. We utter this defence of Forrest because his theatrical career will soon end, and we would fain see, ere it is too late, greater justice done to a man whom once it was the fashion to praise too highly, and who now suffers, at the hands of certain people, unwarrantable neglect.

—Mr. Charles Francis Adams, in a recent lecture, expressed the opinion that the American people cherish an undying hatred of England. This assertion, coming from such high authority, is entitled to every respect, and, if true, may well excite mournful apprehensions in the breast of every true lover of his country. But is it true? Are not national dislikes, as well as local and religious hatreds, matters of complex, shifting, uncertain, and manifold character, easily excited, perhaps, but as easily diverted, and rarely so profound or uncompromising as not to be connected with many cordial sympathies? The bonds that unite people, and the issues that separate them, are usually bonds and issues pertaining to single questions. A man of Massachusetts and a man of South Carolina, having identical religious convictions, will unite fraternally in some cause having a denominational advantage in view, and, on political questions, uncompromisingly oppose and denounce each other. If some expert social anatomist were to trace, through all their ramifications, the strange combinations in which men shift in their relationship to each other, from foes to friends, and friends to foes, the exhibit would be a singular and an entertaining one. On all questions of national difference, there is in America a united hostility toward England, and yet we do not believe there is among us "an undying hatred" of the English people. It is easy to mistake this political opposition for a general dislike, especially by one who is distinctly canvassing the public sentiment, because, even if he has not inflamed the popular imagination, he has invited an expression of feeling on the one narrow point only. A larger investigation would discover that each man, with all his political rancor, has a special bond of union

with England. Some of the community delight in her Church, others in her literature; some are admirers of her great men, others have kindly recollections of her hospitalities, and all unite in appreciating her many sturdy virtues. If one were to judge solely by political journals and political discourses, he would justly infer that Democrats and Republicans have for each other "undying hatreds." The religious newspapers appear to indicate intense hostility between denominations, and local animosities between rival cities are always aflame. But these manifestations of hostility are usually as superficial as they are inflammable. Let us hope that America, with prejudices and dislikes too many, has no "undying hatred" for any thing but evil; and that, in her heart of hearts, there is no lack of kindly sympathy for her Cousin Bull.

—Our illustration on the first page, of "a Nook on the Hudson," represents a scene on the east bank of the river, above Peekskill. A modest and solitary cabin stands near the water's edge, on a little plain closely hemmed in by giant walls of granite, surmounted by dense woods, and forming, in all its surroundings, a thoroughly romantic scene. This place, so quiet and secluded, was many years ago the scene of a shocking tragedy. A bridal party, full of life and gaiety, were returning from the performance of the ceremony, when, as they passed along the road above this spot, the horses of the carriage containing the bride and bridegroom became frightened and dashed over the precipice, at the foot of which the bodies of the newly-married pair were found mangled and lifeless.

Literary Notes.

THE Paris correspondent of the *Publishers' Circular* writes, in December: "There is scarcely a bookseller's shop open. All the German booksellers have been expelled the country; even Herr Friedrich Klinecksieck's position as bookseller to the French Institute, and to the Imperial Library, did not exempt him from this stupid measure. His shop is closed, and all his young men have quitted France with him. Messrs. Hachette & Cie. keep open, but they have now only twelve persons in their immense establishment. They have discontinued the publication of all their periodicals; so have Messrs. Firmin Didot. 'La Bibliographie de la France' has suspended its appearance. Many of our newspapers have ceased to appear for lack of paper; the majority of the others (among them *Le Journal Officiel*) publish only a half-sheet. No books whatsoever are sold."

Messrs. J. B. Ford & Co., of this city, have published a very useful and valuable work entitled "Mines and Mining of the Rocky Mountains, the Inland Basin, and the Pacific Slope. Comprising Treatises on Mining Law, Mineral Deposits, Machinery, and Metallurgical Processes." It is edited by Professor Rossiter W. Raymond, United States Commissioner of Mining Statistics, and editor of the *Engineering and Mining Journal*, of New York. The object of this work is to convey full information concerning our American mining industry, its condition, profits, methods, and appliances. It comprises a description of all the gold and silver mining districts of the West; a careful discussion of the laws affecting their titles; a

thorough essay on mineral deposits in general, their occurrences, characters, and classification; twenty-seven chapters, profusely illustrated, on the mechanical appliances of mining and on metallurgical processes; and an appendix, with valuable tables of statistical information. Three alphabetically-arranged analytical indexes, one of Mines, one of Mining Districts, and one of Subjects, complete the work. It is a large work, of eight hundred octavo pages, illustrated in matters where illustrations are needed, and appears fully to exhaust the theme on which it treats.

J. B. Lippincott & Co. announce that, providing a sufficient number of subscribers can be obtained, they propose to publish "The Life of the Hon. John J. Crittenden, with Selections from his Correspondence and Speeches," edited by his daughter, Mrs. Chapman Coleman, with two portraits engraved on steel, in two handsome, large octavo volumes, printed on toned paper, and bound in fine cloth. His correspondence, which contains much important information in connection with the political history of the United States, as expressed both in the letters from his own pen and the communications from such distinguished contemporaries as Webster, Clay, Taylor, Scott, etc., will be included in the volumes.

The works of "E. Marlitt" (Mdlle. John, of Arnstadt) have had the widest circulation of any novels written by German women. "Goldela," "The Old Mam'selle," and "Countess Gisela," are known wherever German is spoken. The success of these works is characteristic of the German middle classes, and of their family journal, the *Gartenlaube*, in which the tales first appeared. The writer possesses a decided talent for story-telling, and an unusual skill in depicting every-day life; so she manages to construct harmless romances, which delight and do not harm blond German misses.

We have received a copy of the "Annual Report of the Washington School-Board," for which we are indebted to Mr. George J. McLellan, chairman of the committee. Mr. McLellan's report is very full, copious, and interesting. We learn that Washington schools now number one hundred and nineteen, that nearly twelve thousand children are enrolled for attendance, and that, by excellent financial management, a surplus of one hundred and eleven thousand dollars remains in the treasury—the expenses having fallen short of the appropriations to this amount.

"Recollections of Society in France and England," by Lady Clementina Davies; "The Life and Adventures of Count Beugnot, Minister of State under Napoleon I.," edited from the French, by the author of "The Heir of Redclyffe"; "Impressions of Greece," by the Right Honorable Sir Thomas Wyse, K. C. B.; and "Turkish Harems and Circassian Homes," by Mrs. Harvey, of Ickwell Bury—are announced for publication in England.

The London *Spectator* says: "Mr. Swinburne has striven hard, no doubt, to erect an English literature of impurity, based on the best models of France; but, when the thing was done in plain English, its vileness, its want of manliness, its imp-like orgies, filled men of the world with unutterable loathing, which was only intensified by the plaudits of the little clique who placed the young poet in the same rank with Shelley."

Moritz Müller, well known for his opposition to classical studies, has just published a book called "In the Land of Thinkers," in

which he intentionally ignores the advantages of classical study, and brings out as his strongest argument against them the immorality of Greek and Latin authors.

Dr. N. Hocker, the author of a "History of the War of 1866," which has reached its sixth edition, is now writing "A History of the Franco-German War of 1870," which will be completed at the end of the present war, and will be published by A. Budeker, of Cologne.

An Italian author is now engaged in redeeming the memory of Catherine de Medici from the obloquy which, he says, has so long and so unjustly surrounded it. He intends to prove her one of the best of women.

A work, entitled "Travelling Letters from Egypt," by Louisa Mühlbach, the novelist, giving an account of her visit to Egypt, on the occasion of the opening of the Suez Canal, is well spoken of in Europe.

Lippincott's "Dictionary of Biography and Mythology" has now reached its twenty-ninth part, coming down to the end of the letter Q. This work is very comprehensive and valuable. Forty-five parts will complete it.

A series of papers is announced, by Charles Cowden Clarke, on "The Comic Writers of England." They will appear in the *Gentleman's Magazine*.

The heirs of Jane Austen have held, since her death, a novel, in manuscript, which is now to be published. The title will be "Lady Susan."

The long-expected "Life and Letters of Hugh Miller," the geologist, by Mr. Peter Bayne, is announced as in the press in London.

It is stated that three times as many Americans as Englishmen visit Stratford-on-Avon. Shakespeare is much more read in this than in his native country.

A London journal speaks of Bryant's translation of Homer as the best English version yet made.

Scientific Notes.

Professor Agassiz.

AN English journal publishes the following extracts from letters, addressed by Agassiz to a friend in England, from which it will be seen that the eminent naturalist has so far recovered from his late severe illness as to be able again to interest himself in scientific pursuits:

"CAMBRIDGE, November 24.

"I am slowly recovering, and find myself gradually returning to the ways of active life. As I wake anew to feel an interest in scientific pursuits, there is nothing for which I have a greater longing than the fossil fishes. If I could leave my house, I would fly to you to resume the examination of your and Lord Enniskillen's collections. The recent discovery of Krefft has added fuel to the fire, and I feel the most intense desire to revise the facts bearing upon the relations of the Ganoids and Selachians in general, and more particularly those of the *Cælocanthi*, to which, from the examination of the skeleton sent me by Krefft, I find his *Ceratodus Forsteri* belongs. It will no doubt turn out that the Dipterini are close relations. In this connection I am reminded of what you once wrote to me of the teeth of *Ctenodus*. Will

you now have the kindness to give me all the particulars? I am having sections of the teeth of *Ceratodus Forsteri* and some of the fossil species made for comparison. I have little doubt already that this genus will turn out to be one of the most curious *synthetic* types (I call them) in the animal kingdom, exhibiting characters of Placoids (Selachians), in the teeth, Ganoids in the scales, their embryonic characters in the preservation of a dorsal chord, instead of distinct bony vertebrae, and finally hollow bones as in birds."

"CAMBRIDGE, December 24.

"I take it some of your naturalists will crow over what they will be pleased to call my stupendous mistake in referring the teeth of *Ceratodus* to the Selachians, when the fish proves to have large imbricated scales; and yet I never was more pleased than when I learned the fact, for it settles beyond dispute the existence in nature of types, to which I have long ago called attention, under the name of *synthetic types* (see my 'Essay on Classification'), but of which naturalists have thus far taken little or no notice. When I described the teeth of *Ceratodus* as those of a distinct genus among the Cestracions, I was led to do so by appearances which secured for this association the assent of all naturalists. As long as the fossil teeth only were known, nobody questioned the relationship. Owen himself, in his 'Odontography,' mentions the teeth of *Ceratodus* and their structure, and has not a shadow of a doubt that I am right in placing that genus near Cestracion; and now comes the discovery that *Ctenodus*, a genus also referred to the Cestracions, is based upon the dental plate of a bony fish, closely allied to the one recently discovered by Krefft, and referred by him to the genus *Ceratodus*. Is not all this the most palpable evidence that there exist in Nature types which combine structural features that are entirely separate in other types? and it is to such types I have applied the name of *synthetic types*."

War Notes.

Military Courage.

LOOKING merely at the facts, we find that they come pretty much to this—that the Germans have fought with great gallantry, and have never run away or refused to fight; that the French have fought with great gallantry too, but on not a few occasions have fled in utter panic, or else surrendered on the spot, after, to say the least, a very modest show of resistance. It would be unjust, however, on this account to pronounce the French to be inferior in military courage to the Germans. National prowess is not to be estimated, like shooting at a pigeon-match, by the number of marks scored on one side or the other. It is necessary to look at the conditions under which courage is displayed on the one side, or the want of it on the other. From the common talk about courage, one might fancy it was a fixed permanent quality; on the contrary, there is nothing so fluctuating and so dependent on varying external circumstances. There are not only many degrees, but many kinds of courage—individual and corporate courage, the courage of stupidity and of intelligence, of hope and of despair. And not only are there all these varieties of courage, but the same man may possess, or be possessed by, all of them at different moments. It was the surviving zouaves who fought so desperately at Wörth, who ran away so disgracefully at Paris. In the same journal we read that the Mobiles with Garibaldi in the east of France are skulking in

ditches, scampering off across fields, or flinging themselves on the ground in abject terror, while other Mobiles at Brie and Champaigny on the Marne are attacking the Germans with impetuous and persistent daring. Yet in both cases the Mobiles were drawn from the same stock, and if their positions had been exchanged would doubtless have behaved in the same way. Indeed, many of the very Mobiles who ran away from Orleans in the first instance, displayed great bravery when first led back to Orleans by D'Aurelle, but again lost heart gradually in the three-days' fighting. The behavior of a body of troops is by no means an accurate measure of the personal bravery of the individuals composing it, or even of the majority of them. The courage corporate which "drags the coward to heroic death" is a familiar feature in the private history of armies. It may require more audacity to run away under the eye of comrades than to stop and fight; but, beyond this, there is an infectious spirit of bravery which is irresistible, and of which a very little leavening may at a propitious moment be sufficient to leaven the whole mass. Fear is equally contagious; and just as many a poor creature has been carried forward, helpless and unwilling, by the mere force of the surrounding enthusiasm, into some heroic exploit, so have brave men been similarly swept away in a tide of panic. If the plain unvarnished history of any war were written, not the least startling page would be that which recorded the large and continual desertions which are always thinning an army in the field.

War Seventy-five Years ago.

Terrible as are the sufferings of many of the wounded in the present war, and imperfect as the arrangements may be for tending them, they at least, as a rule, receive better treatment than the sick and wounded of the British army in Holland, in 1795, under the Duke of York. The accounts given in the records of the day show how scandalous was the conduct of the then military hospital authorities, and it is not surprising that the medical board, as well as the commissaries, became objects of great hatred and indignation. The following extract from a report of an eye-witness gives some idea of the condition of affairs:

"January 21, 1795.—Our" (the British) "hospitals, which were lately so crowded, are for the present considerably thinned. Removing the sick in wagons, without clothing sufficient to keep them warm in this rigorous season, has sent some hundreds to their eternal home, and the shameful neglect that prevails through all that department makes our hospitals mere slaughtering-houses. Without covering, without attendance, and even without clean straw and sufficient shelter from the weather, they are thrown together in heaps, unassisted and unprotected, to perish by contagion, while legions of vultures, down to the stewards, nurses, and their numberless dependants, pumper their bodies and fill their coffers with the nation's treasure, and, like beasts of prey, fatten on the blood and carcases of their unhappy fellow-creatures, of whom not one in a hundred survives, but perishes under the infernal claws of these harpies, still thirsting for more blood, and rioting in the jaws of death. For the truth of what I say, I appeal to every man in the army who has only for a few hours observed with an attentive eye the general rule of conduct in our hospitals of late, and witness here the scene before me while I now write. A number of men lying on a scanty allowance of dirty wet straw, which, from the heat of their bodies, sends up a visible steam, unable to help themselves; and though a sufficient number of men are liberally paid for their attendance, none has been near for several hours, even to help them to a drink of water. Five carcases, covered only with the rags they wore when they were alive, are piled upon one another in the yard on the pretence that the

ground is too hard to bury them until a thaw comes."

Dr. Russell, in a recent letter from Versailles, narrates the following incident: One of the great military chiefs was going to his quarters the other evening inside the princely precincts, when he was brought up by the point of a bayonet, and a demand for the password. The general had forgotten it. "I am General von —," he explained; "I have forgotten the pass." The sentry was a man of few words, but they were emphatic. In Polish-German, he merely observed, "I will shoot you!" and looked so very like it, that the general desisted from verbal controversy, and waited till a soldier from the post had returned with an officer to identify his excellency and give orders for his release.

In the recent fighting around Paris, the Germans and the French suffered equally; the casualties in killed and wounded are said to be seventeen thousand in the sorties alone. It is stated that the horses lying dead upon the field, already torn by shell, and many of them still warm, were eagerly utilized by the hungry French troops. It was, one writer says, a sight more singular than agreeable to see a group of officers and men hacking away with their knives, and occasionally their swords, at one of these red carcasses, and trying politely to outmanœuvre each other in the general struggle for the daintier bits.

The weather in France has lately been very inclement, and must greatly add to the sufferings of the soldiers in the field. The Germans have probably the best chance of keeping warm, for their upper coat is very substantial; the French *tentes d'abri* are not of much avail. The Germans before Paris have not received the sheepskin coats, said to have been on the way for them; but the outpost men have each a new thick blanket which they wear in the form of a plaid across the shoulders.

The Archbishop of Paris has paid a visit to the Breton ambulance. He urged the wounded to join their regiments again as soon as they recovered, and to continue to combat the enemies of France. He told them never to think of surrendering, but to fight for the deliverance of the country, and said he regretted that his ecclesiastical character prevented his shouldering a rifle on the ramparts.

General d'Aurelles's officers say that his military capacity was paralyzed by his putting himself into the hands of the Bishop of Orleans. The bishop inflicted a penance upon him, in consequence of which he remained on his knees for four consecutive hours at the altar of a saint, when he should have been attending to his business.

Miscellany.

The Diamond-Diggings.

THE centre of the diamond-producing district of South Africa may be conveniently indicated by the junction of the Hart and Vaal Rivers. According to recent advices, the strip of land between these rivers has constituted itself a republic, of which the capital is a town, actual or possible, called Klipdrift. The new state was raising, by conscription, an army of two hundred men, which was to be employed in putting down a rebellion at a place called Hebron, within its assumed frontier. The most remarkable event which had lately occurred in this district was, that a man who had found a diamond on another's "claim," had

had the honesty to give it up to him; and this appears to have been thought a very remarkable event indeed. The accounts which are sent home of the labors and disappointments of diamond-digging will probably have no effect in deterring fresh adventurers from following those who have already started in pursuit of fortune. There is, indeed, no reason why this emigration, having begun, should not proceed. The work is hard and the prizes are few, but the field of search is practically boundless. Each lottery contains many blanks, but there seems nothing to prevent the establishment of any number of lotteries offering equal chances. Hebron, the seat of rebellion, is described in a recent letter as "a very little, quiet place" on the Vaal River. The river here is three hundred yards wide, with trees on each side, and very pretty. A digger begins work at sunrise, and keeps at it, with intervals of half an hour and an hour for breakfast and dinner, until sunset. He breaks ground with a pick, carts the soil to the river, washes and sorts it. A young man of strength and resolution may support this life for a long time, in the hope of some day finding a prize; but it is a very hard life, and hope in many cases changes into despair. "I think," says a writer, "that in the long-run one is sure to hit on a big 'un." He and others will think this until they have expended their last penny in necessary supplies, and then they will leave the diggings, having learned that the conditions of life there are much the same as everywhere else. Some men starve, others barely live, and a very few grow rich. This writer has no time for rebellion, nor even for society. "After working all day, a fellow feels too tired to go out at night, and I generally read for an hour, and then go to sleep." Picking, carting, washing, sorting, form the daily round of duty. Shooting and fishing are allowed only for the pot, when the associated diggers become weary of invariable mutton. The tools and processes of diamond-digging are simple. The soil, after being picked and carted, is washed at the river-side in a cradle containing two sieves. "We put a lot of stuff in the top sieve, rock the cradle, while a Kaffre pours water on till all the small stones have gone through the top sieve, and the dirt is all off. We then look roughly over the big stones in the top sieve, and throw them away. The bottom sieve is then emptied on to a table, and we have to look carefully over the stones." "We" consist of the writer, his English partner, and a Kaffre. The serenity of Hebron is disturbed, not so much by the threatened invasion of the army of two hundred men from Klipdrift as by the reported proximity of bands of fighting Kaffres, who scare the working Kaffres from the cradles by threats of death if they continue at them.

The Broom, the Shovel, the Poker, and the Tongs.

I.

The Broom and the Shovel, the Poker and Tongs,

They all took a drive in the park,
And they each sang a song, ding-a-dong, ding-a-dong,

Before they went back in the dark.

Mr. Poker he sat quite upright in the coach,

Mr. Tongs made a clatter and clash,

Miss Shovel was dressed all in black (with a brooch),

Mrs. Broom was in blue (with a sash).

Ding-a-dong! ding-a-dong!

And they all sang a song!

II.

"O Shovel, so lovely!" the Poker he sang,

"You have perfectly conquered my heart!"

Ding-a-dong! ding-a-dong! if you're pleased
with my song,

I will feed you with cold apple-tart!

When you scrape up the coals with a delicate
sound,

You enrapture my life with delight!

Your nose is so shiny! Your head is so round!

And your shape is so slender and bright!

Ding-a-dong! ding-a-dong!

Ain't you pleased with my song!"

III.

"Alas! Mrs. Broom!" sighed the Tongs in
his song,

"Oh, is it because I'm so thin,

And my legs are so long—ding-a-dong! ding-a-dong!

That you don't care about me a pin?

Ah! fairest of creatures, when sweeping the
room,

Ah! why don't you heed my complaint?

Must you needs be so cruel, you beautiful
Broom,

Because you are covered with paint?

Ding-a-dong! ding-a-dong!

You are certainly wrong!"

IV.

Mrs. Broom and Miss Shovel together they
sang,

"What nonsense you're singing to-day!"

Said the Shovel, "I'll certainly hit you a
bang!"

Said the Broom, "And I'll sweep you
away!"

So the coachman drove homeward as fast as he
could,

Perceiving their anger with pain;

But they put on the kettle, and, little by little,
They all became happy again.

Ding-a-dong! ding-a-dong!

There's an end of my song!

A Strange Murder.

The old saying that truth is stranger than fiction never had a more remarkable illustration than in the case of four respectable Hindoos, who are now undergoing a sentence of penal servitude for life in the Andaman Islands for a murder that they were alleged to have committed. One of the prisoners was a wealthy native merchant of Sholapoor, in the province of Bombay; his wife and her two brothers complete the number. The victim of the alleged murder was a poor boy of low caste, a chamber, or shoemaker. There was nothing to be gained by his death in any way, nor was there the least ill-feeling or jealousy, or any conceivable motive for such a crime. More extraordinary still, the crime was perpetrated in a house where more than twenty persons were sleeping over-night.

It would appear that the merchant of Sholapoor is a devotee of one of the innumerable religious sects of India—the Jains, who eschew animal food, and consider it a sin to kill even those little animals that flesh and blood cannot endure. Toward the close of 1867 he left home with his wife to visit his father-in-law at Madha, and then to go on to Eedur, a place sacred to his sect. He never got farther than Madha, the tragic events of his one night's stay putting an end to all thoughts of pilgrimages. The visit was of course an occasion for joy and festivity, and the father-in-law had engaged several strangers to help in the preparation of a banquet in honor of his son-in-law.

When all had retired for the night, they numbered about twenty, including some strangers. The house in which they slept stood alone, surrounded by a wall, which, however, does not seem to have been high enough to

keep out intruders. All the persons who are suffering sentence slept on the floor of the verandas or balconies in the front of the house, a common practice in India when the weather is very warm. It was about midnight when, all being fast asleep, and the lights put out, a noise was heard in the veranda, and cries of "Thief! thief!" and "Catch him! catch him!" The inmates arose; and there was a good deal of struggling and confusion. What occurred is matter of conjecture, but when the police officers entered from the outside with a light, the chamber boy was found lying dead with his throat cut, near the door of the veranda where two of the prisoners were sleeping. All the prisoners, and especially the merchant's wife, were marked with stains of blood; one of her fingers was cut and bleeding.

The woman's account of the affair was that during the night she felt some one sitting beside her, and touching her neck with his hand, as she thought to steal her ornaments. She then raised a cry of "Thief!" and, in the struggle that ensued, was wounded in the finger. It was then given out that the boy, having been caught in the act, committed suicide. When the case was before the magistrate, no other solution was suggested, and the accused were dismissed.

The mystery of the affair, however, excited a great interest, and many explanations were suggested. The theory of suicide was discredited as totally unworthy of belief. Gradually a horrid suspicion crossed the minds of some of the neighbors, and, assuming consistency as it was propagated from mouth to mouth, soon became accepted, and for the first time the accused were in danger. There existed once generally in India a cruel superstition; when hidden treasure was to be guarded, a boy of black color was to be murdered, and his spirit, so let free, would hover around the treasure and preserve it. This diabolical opinion is certainly not shared by the intelligent part of Bengal; it is doubtless confined to the ignorant and lowest class. It was not likely to be an article of faith to a wealthy merchant; and, still more, to the devotee of a sect that looked upon all animal sacrifice with abhorrence. Nevertheless, this theory of the murder was greedily swallowed, and a person claiming to be a relative of the shoemaker-boy came forward and demanded a new trial. This was granted, and the result was that all the four prisoners were convicted, the jury putting faith in the strange story.

Women's Work.

If women want work, what doth hinder them from getting it? They flock to the school-houses for situations as teachers, till I doubt not there are twenty applications for every vacancy, and, in many instances, I know there are twice and thrice that number. They press against the doors of the Government offices, and, for one who is received, scores are sent disappointed away. They will be clerks, copyists, amanuenses, any thing which promises light employment, permits tasteful dress, and bestows even a moderate remuneration; and for this they will wait and pray and suffer. But to the fields that are really ripe for harvest, the laborers are distressingly few. It has been dinned and dinned into the ears of women that the place where they are wanted is the kitchen; but into the kitchen they will not go. They are sorely wanted in the sewing-room; but the sewing-room is to them an abomination. They have no taste for these things, it is said. It seems degrading to a girl of good education to assume the business of cooking or clear-starching; but there is a call for ten times as much mind, skill,

judgment, wisdom, in managing a cooking, or an ironing, or a sewing-department, as is required to count money or copy letters.

Sick-nursing is an occupation the most honorable, important, and remunerative. The demand for nurses is constant and urgent. They receive whatever they choose to ask. No skill, no training, no education, no refinement, is thrown away here. And it is a calling peculiarly womanly; so much so, indeed, that only the money earned puts it in the sphere of man. You would suppose that women would rush into it. On the contrary, they assiduously keep out of it. The scarcity is so great that the need is always pressing, often distressing, and not infrequently fatal. I am amazed, I am indignant to hear this outcry for a wider sphere and greater opportunities for woman, while her sphere is already a thousand times wider than she spans, and her opportunities a thousand-fold greater than she has ever attempted to measure. Every sphere under the sun is open to her but the do-nothing sphere. Every imaginable opportunity is offered her except the opportunity to sow tares and reap wheat. The cry for work, the clamor for a career, are the cry and clamor of weakness. Strong eyes see work, and strong hands do it, and say nothing about it. She who is equal to a career enters upon a career, and there is no flourish of trumpets. Be sure she who complains of obstacles is not the victim of obstacles.—*Gail Hamilton.*

The Rank of the States.

The rank of States, according to population, has changed since 1860, as shown by the following table. New York holds its own at the head of the line:

STATES.	Rank in Population.		Rank in Population.	
	1860.	1880.	1870.	1870.
New York.....	1	3,880,735	1	4,370,346

The Mocking-bird.

The mocking-bird of Florida is described as rather a dissipated character. He forages about, singing in his neighbor's vineyard while he robs him, until the berries of the Pride-of-China are ripe, then he proceeds to have a regular frolic, acquires a habit of intoxication, and gets as drunk as a lord. It is curious to see a flock of these birds at this time. They become per-

fectly tipsy, and fly round in the most comical manner, hiccupping and staggering just like men, mixing up all sorts of songs, and interrupting each other in the most impudent manner, without any regard to the politeness and decorum that usually mark the intercourse of all well-bred society, whether of birds or men. They will fly about promiscuously, intrude on domestic relations, forget the way home, and get into each other's nest and families, just like the lords of creation. After the berries are all gone, and the yearly frolic is over, they look very penitent, make many good resolutions, join the temperance society, and never indulge again till the next season comes round, and the berries are ripe once more.

The Sleigh-ride.

Jingle! jingle! jingle! jingle!
Jingle, sleigh-bells, jingle! jingle!
As we swiftly, smoothly glide,
Seated snugly side by side,
Maud and I.

In the sky
Moonbeams clear and bright
Sparkling glow
On the snow;
By their crystal light,
Peeping from a heap of fur,
Two bright, lovely eyes I see,
Like twin diamonds they appear,
Shining, twinkling merrily;
While the silvery sleigh-bells jingle,
Jingle, jingle, jingle, jingle.

Round her waist I put my arm—
Am I doing any harm?
She don't show the least alarm,
For—I only keep her warm!
And the bright
Calm moonlight
Has such charms, you know,
As we glide
Side by side
Swiftly o'er the snow.
When her eyes upturn to mine,
Archly glancing, tempting sweet,
Can I help it then, I pray,
If our lips together meet,
And the sounds of kisses jingle
With the sleigh-bells' merry jingle!

Can I help it if each kiss
Wakens thoughts of future bliss?
Can I help my new-born love
When I ask if she will ride
Side by side
Down the tide
Of this stormy life?
If she'll be
Unto me
My own cherished wife?
"Yes," she whispers, sweet and low,
Closer nestling to my side.
There's no harm in kissing now,
Maud, my darling, promised bride.
Jingle! jingle! jingle! jingle!
Merry sleigh-bells, jingle! jingle!

A Spiritualist in Florence.

And now a word or two for remarkable persons whom I met in Florence. One of the most interesting was Mr. Kirkeup, the English artist, whose name will always be connected with Dante, on account of his exertions in restoring the Grotto portrait of the great poet, which can be seen in the frescos of the Bargello chapel. Mr. Kirkeup is an ardent spiritualist, and believes that Dante visits him constantly. He speaks of Dante as we would of our next-door neighbor, and most intimate friend. Dante, he says, is a little vain of his personal appearance, and has been so gratified with the dis-

covery of the Bargello portrait, which is a pleasing one, that he secretly influenced the Italian Government to make Mr. Kirkecup a baron, and confer on him a distinguished order! It is very curious study to listen to the old gentleman's talk on the subject.

"Dante," he said, "told Regina" (a deceased friend of Mr. Kirkecup, through whom he believes he receives spiritual information), "that her guardian spirit held a higher rank than his. He begged her to ask this angel to promote him. Regina did so, and the request was granted. As soon as he received his advancement, Dante called on us, dressed in his new costume."

I asked, of course, what was the difference between the new and old dress.

"Oh, the first was all white! After his promotion his dress was blue, rose-color, and green. And, I assure you, Dante was very well satisfied with the change."

Mr. Kirkecup lives in a queer old house at the end of the curious Ponte Vecchio; its side windows look out on the Arno, and the river washes its foundation; the building used to be occupied by the Knights Templar. The rooms are filled with all sorts of rare old things, pictures, engravings, illuminations, bits of majolica, Venetian glass, all huddled together without order; among them I noticed some brilliant initial letters, painted by Gaddi. On an easel was a half-finished picture, for Mr. Kirkecup, though over eighty, still keeps up the practice of his art.

The Sailor's Grave.

The following poem is said to have been written by Campbell, though we believe it is not in any collection of his works:

There is in the wide blue sea

A spot unmarked but holy,
For there the gallant and the free
In his ocean-bed lies lowly.

Down, down beneath the deep,
Which oft in triumph bore him,
He sleeps a sound and peaceful sleep,
With the wild waves dashing o'er him.

He sleeps serene and safe
From tempest and from billow;
The storms that high above him chafe
Scarce rock his peaceful pillow.

The sea and him in death
They did not dare to sever;
It was his home while he had breath—
'Tis now his home forever.

Sleep on, thou gallant dead!
A glorious tomb they've found thee;
The bright blue sky is o'er thee spread
The boundless ocean round thee.

No vulgar foot treads here;
No hands profane shall move thee;
But gallant fleets shall proudly steer,
And warriors shout above thee.
When the last trump shall sound,
And graves of earth be riven,
Like the morning sun from the waves thou'lt bound,
To rise and shine in heaven.

A Remarkable Journey.

Lieutenant G. C. Musters, of the English Navy, landed in April, 1869, in the Chilean penal settlement in the Straits of Magellan, made friends with a Patagonian cacique, named Orkeke, studied his people, learned their language, joined their hunting-parties, and finally induced them to join him in a march of seven hundred miles to the Rio Negro. The chase lasted many months, and was one continuous march for food. In May, 1870, Lieutenant Musters, who had completely won

the confidence of the people, as that kind of man always does, marched eastward down the valley of the Rio Negro, and finally debouched at its mouth within the Argentine Republic. The climate was cold, but the Patagonians were pleasant people, and remarkable among savages for affection for their wives and children. Their country is wholly unknown to Europeans, and has never been traversed before.

Varieties.

THE Norway Maelstrom, of the old-school books—as most people know already—is a myth. At certain stages of the tide there is something like a whirlpool, and in bad weather the place is a dangerous one, even for large vessels; but if these are wrecked, it is by being dashed against the rocks, or by foundering—not by being drawn down into a vortex. In 1859, an official report on the subject was made by Mr. Hagerup, Minister of the Norwegian Marine, who says that more violent currents of the kind are to be found at other points on the coast of Norway, but the worst of them is not so bad as the Maelstrom of the old stories.

At a certain college the senior class was under examination for degrees. The professor of Natural Philosophy was badgering in optics. The point under illustration was that, strictly and scientifically speaking, we see no object, but their images depicted on the retina. The worthy professor, in order to make the matter plainer, said to the wag of the class: "Mr. Jackson, did you ever actually see your father?" Bill replied promptly, "No, sir." "Please to explain why you never saw your father." "Because," replied Mr. Jackson, gravely, "he died before I was born, sir."

Not long ago the criminal court in Galveston, Texas, adjourned at noon until three o'clock P. M. The judge failed to appear at that hour; and about four o'clock he entered the court-room, and, on taking his seat, said: "Mr. Clerk, enter a fine of one hundred dollars against Samuel Dodge, judge of this court, for being absent at the hour to which the court adjourned."

Professor Huxley has recently pronounced very decidedly in favor of the introduction of the Bible as a "reading-book" in common schools. The ground of his advocacy is, that there must be a moral substratum to a child's education to make it valuable; and that there is no other source from which this can be obtained at all comparable with the Bible.

The experience of a young lady who recently went shopping among the hair-dealers, proves that the kind of hair known as "blond hair," is worth more than its weight in gold. The precious metal can be bought for seventeen dollars the ounce, but the venders of capillary ornaments demand twenty-five dollars for one ounce of "blond" hair.

The night-editor of a daily paper wrote this head-line to one of his cable dispatches: "The British lion shaking his mane." He was unable to eat his breakfast next morning, when he found the printer's version of the matter staring him in the face thus: "The British lion skating in Maine."

In speaking of the decline of interest in popular lectures, the *New York Commercial* says, the newspaper has taken the place of the lecture, and its discussions of the events of the time have the merit of freshness and honesty, if not of the elaboration and tediousness of the lecturer's hour-long homily.

The hunters of Siberia, when pressed by hunger, take two pieces of board, and, placing one on the pit of the stomach and the other on the back, gradually draw together the extremities, and thus allay in some degree the cravings of appetite. This is supposed to be a very economical kind of board.

Dr. Lankester, a London magistrate, has given notice that, in case any person shall come by his death through slipping on pavements from which the snow had not been removed, he will direct the jury to return a ver-

dict of manslaughter against the person through whose neglect the accident may have happened.

It costs about three hundred and seventy-five thousand dollars a year to "run" one of our crack naval frigates, after the snug sum of two million dollars has been swallowed in her construction. Fully manned and officered she carries six hundred and fifty souls.

A Paris correspondent writes: "All the animals in the Zoological Gardens have been killed, except the monkeys; these are kept alive from a vague and Darwinian notion that they are our relatives."

"Call that a kind man," said an actor, speaking of an absent acquaintance, "a man who is away from his family, and never sends them a farthing? Call that kindness?" "Yes, unremitting kindness," Jerrold replied.

A traveller says, he goes prepared for escape from burning hotels, by carrying in his satchel a coil of half-inch rope, forty or fifty feet long, knotted every two feet, to give a better hold. On two occasions, he has found it serviceable.

Photographers must be brilliant in controversial discussion, as, no matter how hard a subject may be presented to them, they are always prepared to take the negative and furnish proof of the correctness of their view.

The *Courier du Bas Rhin*, the principal paper of Strasbourg and Alsace, has been purchased by a German publisher, and a German has been installed as chief editor.

There are in the State of New York one hundred and thirty-three savings-banks, with assets amounting to two hundred and twenty million dollars.

A clairvoyant doctor of Hartford proclaims his superiority over all soothsayers, astrologers, prophets, by advertising that he "foretells the past and present," as well as the future.

A medical journal estimates that the people of the United States pay one hundred and twenty-five million dollars yearly for physicians' services and for medicines.

The South-African "diamonds," supposed to be worth, some of them, from ten to three hundred thousand dollars each, are pronounced, in London, to be merely clear lumps of quartz.

Ladies' paper skirts, costing but fifteen cents, are becoming common. The paper is of great tenacity, and does not easily tear. It is of various colors.

The ladies of Newport and Saratoga are outdone by the wife of Mehemet Ali, who required five hundred camels to transport her baggage, when she went a-visiting.

"Mamma, can a door speak?" "Certainly not, my dear." "Then, why did you tell Anne, this morning, to answer the door?" "It is time for you to go to school, my dear."

A London paper says that the Americans are the readiest speech-makers the world has ever seen.

"A prudent man," says a witty Frenchman, "is like a pin: his head prevents him from going too far."

An acre of land has been sold in the city of London for three million six hundred thousand dollars.

It has been discovered that bull-fighting is an amusement in China.

A farmer gathers what he sows, while a seamstress sews what she gathers.

A poetical genius describes ladies' lips as "the glowing gateways of pork and potatoes."

As we often hear of flying bricks, we ought not to be astonished at hearing a chimney flue.

Cotton was first planted in the United States in 1759.

It is a curious paradox that men of the smallest calibre are often the greatest bores.

A flourishing business—ornamental penmanship.

The man who works with a will—the probate judge.

The Museum.

THE religion of the Maories, or native New Zealanders, is a curious mixture of simplicity and elaboration, having the usual superstitions common to all savage tribes. Of real religion they have no idea, and, as far as is known, even their superstitions lack that infusion of sublimity which distinguishes the religious system of many savage nations. They have a sort of indefinite belief in a good and evil influence; the former going by the generic name of Atua, and the latter of Wairua. Now, Atua is a word that has a peculiar significance of its own. It may signify the Divine Essence, or it may be applied to any object which is considered as a visible representative of that essence. Thus, if a Maori wishes to speak of God, he would use the word Atua. But he would equally apply it to a lizard, a bird, a sun-ray, or a cloud. There is one species of lizard, of a lovely green color, called by the natives *kakariki*, which is held in the greatest veneration as a living representative of divinity, and is in consequence always drended as an atua.

Objects which they cannot understand, are often considered by the Maories as atuas. Thus, a compass is an atua, because it points in one direction, and directs the traveller by its invisible power. A barometer is an atua, because it foretells the weather. A watch is an atua, on account of the perpetual ticking and moving of the hands. Fire-arms used to be atuas until they came into common use, and lost the mystery which was at first attached to them. Yet the Maori never addresses his prayers to any of these visible objects, but always to the invisible Atua of whom these are but the repre-

sentatives. While there are many representations of the human form in New Zealand, which are supposed by travellers to be idols, it is doubtful whether images of worship ever existed among those tribes. It was formerly supposed that the green jade ornaments, called "tikis," which are worn suspended from the neck, were idols; but it is now known that

they are merely ornaments, deriving their sole value from being handed down from one generation to another. Our illustration is an example of one of the so-called idols, which is remarkable for its gigantic proportions and curious shape. It is about sixteen feet in height, and, instead of consisting of a single human figure, as is usually the case, the enormous block of wood is carved into the semblance of two figures, one above the other. This arrangement is not uncommon in New Zealand, and is found also in Western Africa. It stands, together with several others, near the tomb of the daughter of a native prince, and is one of the finest examples of native carving to be found in New Zealand. The precise object of the tiki is uncertain; but the protruding tongue of the upper figure seems to show that it is one of the numerous defiant statues which abound in the islands. The natives say that the lower figure represents Maui, the atua who, according to Maori tradition, fished up the islands from the bottom of the sea. As may be seen by reference to the illustration, nearly the whole of both figures is carved with most elaborate curved patterns, which descend over the arms, and adorn those parts of the statue which do duty for hips. A portion of the paling surrounding the tomb of the princess is seen in the background, and around the tiki grow many plants of the phormium, or New-Zealand flax.

Near this wonderful and mysterious piece of carving stand several others, all of the ordinary type. Although not quite so large as the double tiki of Raocera, they are of very great size.

The firmest belief in witchcraft prevails in New Zealand, though not to such an extent as in many parts of Africa.

A New-Zealand "Tiki."

FROM A PAINTING BY C. BRUN.

BERNARD'S INVENTION.

III.

It was near the close of a soft October day, when Annie Gordon sat in the garden quite alone. She was not drawing, or reading, or even sewing, though some of the latter work lay on the ground by her side; but she sat quite motionless on a low seat under a brilliant crape-myrtle, with that air of listless languor which is always so sad a sight—especially in a young person. Her hands were loosely clasped in her lap, and her eyes, all unheeding the gorgeous roses blooming near by, and scenting the air with their fragrance, were turned to the western sky, where, instead of the usual glories, a long, low bank of violet cloud had received the sun. She did not even turn when a step sounded on the path behind her, and when, with his head bent forward, and his hands crossed behind his back, her father slowly came into sight. He was absorbed in thought, evidently, and did not see her until he was close upon her. Then he started and spoke almost sharply.

"What are you doing here, Annie? I thought you said that you were going to see Mrs. Holt?"

"I did go," said Annie, in a tone as listless as her attitude, "but Mrs. Holt was not at home. When I came back, you were engaged with Mr. Liddell, so I did not disturb you."

"You might have come in to see Mr. Liddell. His visits are meant for you as much, or more, than they are for me."

"Are they?" said the girl, carelessly, and then she added, "I should be sorry to think so."

Her father frowned a little. "Why?" he asked, shortly.

"Because—oh, papa, surely you know why. It may be foolish to talk of such a thing, but I have thought once or twice that Mr. Liddell admired me—and if so, I would rather that he never came."

"Do you mean to say that if he asked you to marry him, you would refuse him?"

"I hope he will never ask me; but if he did, I should be obliged to refuse him."

"And why?"

"Oh, papa, what a question!" cried the girl, with her languor giving way at once, and her bosom rent with sobs. "Because I don't love him! Because I shall never, never love any one but my poor injured, outcast, ill-treated Louis. Don't—don't mention him to me again."

"I must mention him to you," said Mr. Gordon, and as he said it he sat down by her side. "You are not a child, Annie," he went on. "You are old enough to know that many things have to be done in this world, which are not what we would desire for ourselves or others. I am old; I am broken in mind, in health, and in fortune. What will become of you when I die?"

"God will take care of me."

"God takes care of those who care for themselves. God will not work a miracle to put bread into your mouth or a roof over your head. Many, as young and helpless as you, He leaves every day to die of want and starvation. My child, you must do something for yourself—you must marry the man who has just been telling me how much he loves you."

"Papa!"—she gave a low cry—"papa, surely you will not ask me to do this!"

"You must do it!" said he, beginning to grow excited. "Child, child, do you not see that I cannot last much longer, and then—what will become of you?"

"I would sew for my daily bread, sooner than marry one man when I love another!"

"Perhaps you will wait and marry the thief who robbed me?"

"Papa, I don't deserve this!"

"Marry Liddell, then. He is a good fellow. Let me see you safely settled before I die—let me tell him when he comes again that he may take you."

"Oh, no, no!"

"This is nonsense," said Mr. Gordon. "What more do you expect than he offers? He may not be as fine a gentleman as a Gordon has a right to marry; but we are poor—so poor that our social equals do not recognize our existence; and he is comparatively wealthy. It is true that you would be the richest heiress in the country, if my in-

ventions had not been stolen from me, but now—Annie, there is no help for it. You must marry him."

For at least an hour the discussion went on; but it came to no more definite point than this. At last both father and daughter returned to the house; and then, wearied and exhausted, Annie went up to her own room. She felt heartsick and hopeless at the prospect before her. Not that her resolution was at all shaken, or that she had any fear of being eventually forced to marry Liddell; but she knew that persistence was the most striking trait of her father's character, and she also knew that for days, and weeks, and months to come, she might expect to hear and to combat just what she had heard and combated that evening. There can hardly be a prospect more dismaying than this, so it was no wonder that she sat down and covered her face with her hands. When Bernard went away, she had felt sure that he would soon clear himself, and return to claim her, but now six months had gone by, and the stain on his name was as dark as ever, her father was as obstinately persuaded of his guilt, and her own faith and hope began to waver. "He has forgotten me!" she thought. "Why should I not forget him, and try to marry some one else?" But she had hardly asked the question, before she veered round as quickly as if some one else had proposed it. "Even if I never see him again, I will be true to him—and true to myself!" she cried; then burst into tears, and settled herself to sleep.

Her fears proved to be well-founded. The next day, and for many days after, Mr. Gordon rang the changes on Liddell's suit with an obstinate persistence that would have shaken any resolution less thoroughly grounded than his daughter's. He did not storm, or threaten, or command—none of these things were according to his nature—but he went over the same position again and again, repeated the same statements, and made the same predictions, with a patience that was both marvellous and exhausting. It told at last, even on Annie. She was driven from point to point, until from sheer inability to continue the strife, she yielded thus far—she agreed that Liddell should be allowed to come to the house on trial, that there was to be nothing of an engagement, but that she was to see how she liked him, and if she found it possible (but she did not fail to protest here that she was sure she never would find it possible), she might enter into an engagement at the end of six months. On this anomalous sort of footing, therefore, the master-machinist was received in the Gordon household; and since he had sense enough to appreciate the point he had gained, and tact enough to use his advantage well, he soon became a daily visitor, nor was it long before he perceived that not only Mr. Gordon, but Annie herself, welcomed him with pleasure.

Matters went on in this way until Christmas came. The gaiety of the season—and W—was very gay—sent not even an echo into the dark old house where the inventor and his daughter lived, and yet in all W—there was not a fairer face than Annie Gordon's, as she leaned against one of the high narrow windows, on Christmas evening—dressed in her best, and with a spray of holly in her hair—watching listlessly the carriages that dashed by, and the pedestrians that filled the streets. Liddell had dined with them, and his present—one of the costly gift-books of the season—lay in her lap, but she hardly noticed it. Her languid eyes were on the street, when suddenly something occurred that took all the languor out of them. A figure came in sight, a face looked up at her, and she knew—she would have known in a thousand—Louis Bernard! There was no time for a word, or even a gesture, on either side. There was only time for a start, a gasp, a long, hungry look, and all was over. The young man passed on, and the girl, turning from the window, came and sat down by the fire. Liddell and her father were deep in plans of machinery—it was Mr. Gordon's only mode of recreation—and they paid little attention to her, so she leaned back in a corner quite silent, and the stream of mechanical talk flowed past her unheeded. She caught a fragment of it now and then, but it bore little significance to her ear. She only knew that there was some point at issue between her father and the machinist—some point there seemed no definite mode of settling—and that Liddell proposed to refer to some book of designs he had. "I will send it over to-morrow," he said. "You can examine it at your leisure, and perhaps Miss Annie will be good enough to take care of it for me. It is a very valuable book, and reliable, too. You will find this idea of the cylinder developed there in just the way I have described. It was patented by Veriot in '49."

"I don't care whom it was patented by, it might be improved," said

Mr. Gordon, and so the discussion went on, until Liddell ended it by asking Annie to sing. She complied at once; and, after a reasonable number of songs, he rose to go. He had sufficient discretion not to obtrude the lover-like part of his *role*, and not to pay long visits; and his reward was Annie's constantly-increasing kindness. To-night she was so cold, absent, and almost unapproachable, that he thought he must have offended her, for, of course, he could not know that it was the mere sight of Bernard that had turned her heart against him. "Oh, my poor love!" she was saying to herself all the time, even when he came up to shake hands and bid her good-night. "Will you take care of my book?" he said, again, with a sort of wistful look in her face. "I should be very glad if you would, and if—and if you would make one of your beautiful drawings for me of Plate XL? I want it for constant use, and I had rather have one of your drawings than the finest engraving in the world. Will you do it for me?"

"Your taste is very bad, to prefer my drawing to an engraving," said Annie, gravely. "But, of course, I will do it for you if you want it. I have nothing else to do."

"Thank you, and good-night."

She gave him her hand and said good-night; but it was very coldly, and he went away chilled, thinking almost that he would never succeed in winning her. As for Annie, she went up-stairs and cried for an hour or two, before she sank to sleep. Weeping had latterly become quite a favorite amusement of hers, and the effect was any thing but beneficial to her personal appearance.

The next day the book came, and, after her father had finished examining it, he handed it over to her keeping. It was a volume of mechanical designs, not very interesting to her; but she took it to a window, and began making preparations for copying plate XL. She copied for some time, then grew tired, and, leaning her elbows on the table, carelessly turned over the leaves. As she did so, a piece of paper fluttered out from between two of the pages, and fell to the floor. She stooped, picked it up, and was returning it to the book, when something about it attracted her attention. It was merely an ordinary piece of drawing-paper, on which was traced the rough outline of a design. But the paper itself struck her as familiar. She had seen, she had handled it, she felt sure; and, on looking more closely, she found she was right, for in the corner her own private mark—a curiously-interlaced monogram of her name—was written with ink. It was a sheet of her own paper, and had been taken from her own portfolio. This, which seemed at first sight a slight-enough mystery, puzzled her exceedingly. In consequence of her father's suspicious fears, she always kept her portfolio carefully put away; and, as far as her own knowledge extended, no one, not even Bernard, had ever been permitted to examine it. How, then, had this paper with her own mark upon it, been extracted therefrom? She looked at the design. That was certainly not of her drawing. She shook her head, and was about to put down the paper and dismiss the subject with a "Very curious!" when a few faint, half-effaced lines on the back attracted her eye. She looked at these for a moment with her brows bent—then suddenly rose, pushed back the table, and went nearer to the light. Even this, however, was not sufficient for what she wished to decipher, and she hastily took up a magnifying-glass. By the aid of this, she soon discerned that a design on the back of the paper had been carefully rubbed out, leaving only a few lines visible. These few lines, however, were to her of immense significance, for they showed her that the effaced drawing had been her own, and that it had been one of the designs of her father's invention.

At this point her breath came fast, her hands trembled, her color varied every instant, and, if any one had been looking on, he would certainly have thought her beside herself with excitement. Still, she controlled this excitement, and, though she was tingling in every nerve with the importance of the discovery just made, went steadily on to follow it up as well as she could. Thanks to the magnifying-glass, she soon found what she was now especially in search of—a number in the corner of the sheet. When this was deciphered, she laid the paper down and left the room, returning in an instant with her portfolio. Now it chanced that, having been trained by a man, she had much of masculine precision about her, and in the different pockets of this receptacle were carefully numbered and filed away, in their proper order of date, the designs she had made for the now useless invention. Owing to the number she had just deciphered on the effaced drawing, she knew exactly where to look for the information needed to verify

her suspicions! Opening the portfolio with quivering fingers, she drew forth the contents of a certain pocket, and ran over the numbers. For three or four sheets, all was regular and in order; then, suddenly, she stopped, and again caught her breath. There was a break. Hastily she went on to the end and then came back, looked again, examined again, and finally raised her face with a half-frightened assurance on it—*three sheets were missing! and one of these sheets she held in her hand*

For a moment the conviction almost stunned her. Mr. Gordon was right, then! The idea had been stolen. Up to this time she had believed, with Bernard, that it was a singular but entirely accidental coincidence of thought. Now she knew it had been a robbery. But a robbery made by whom? She was too young and inexperienced to be able to answer this question. Those who have never known treachery are slow to suspect, and slower yet to believe it. The stars might have fallen before she would have credited Bernard's guilt, and she was almost as unwilling to attach even a moment's suspicion to Liddell. Yet, plainly, the matter lay between those two. No one else had even possible access to her portfolio, and the possession of that sheet, the effaced design, the whole array of circumstances, all seemed to point—

She paused and sat down, faint and shuddering. Treachery seemed to come so near, to touch her so closely, when it was brought home in this way to a man whom she had liked, respected, trusted, almost promised to marry! It was all a hideous seeming; it could not be, she cried out—yet, even as she exclaimed thus, there came to her a memory which would not be put aside. She remembered a certain evening in the early spring, when she had been drawing in the arbor, how Bernard had come in upon her, and she carelessly left her portfolio on the table and strolled with him to the other end of the garden. She remembered that, when she came into the house, her father told her that Liddell had been sent to the arbor by him, but failed to find her, and she also remembered—good Heavens, how clearly!—that, on opening her portfolio, she had found several things strangely out of place, though she never once thought of looking at the designs. What if this meant—what if it proved— But here the full nature of the discovery came over her so strongly that, but for the recollection of Bernard, she would have thrust away the tell-tale paper, and never thought again of the dark suspicion it had brought forth. As it was, however, she could not do this. His face, as she had seen it only the evening before, rose up before her, and seemed bidding her clear his name. He could do nothing for himself; but, if indeed she held the means to prove his innocence, should she fail to use it? If Liddell was guilty, surely his double treachery—treachery to Bernard, as well as to her father—deserved to suffer the penalty of detection; and if he was innocent, an explanation could not harm him. At all risks, she was determined to go on—to follow the path thus unexpectedly opened for her. Without giving herself time to think, she seized a pen and wrote a short note—the first in eight long months—to Bernard:

"DEAR LOUIS: Forgive me that I write to you. I only do so, because I have made a discovery which, it seems to me, you ought to know, and which may be of importance to you. What it is, you shall hear when we meet. I must, however, ask one question. Am I right in supposing that Mr. Liddell was the original possessor of the invention which you patented, and that it was he who brought the design to you? If so, do not hesitate to come here this afternoon, and bring all his original draughts with you. "Yours ever,
"ANNIE GORDON."

About four o'clock, that afternoon, there was a knock at Mr. Gordon's door, and when Annie flew down from an ambush on the staircase and opened it, she stood face to face with Bernard. The young man stepped within the passage without a word, and the next moment would have taken the pretty portress into his arms, if she had not drawn away, put her finger to her lips, and beckoned him in the direction of a certain odd little room which no one but herself ever invaded. Once safely inside this sanctuary, she turned and held out her hands, saying:

"O Louis, you cannot tell how glad I am to see you again!"

"And I you, my darling!" said Louis, warmly. But, after a minute, he went on more gravely: "I don't like this, Annie. I did not know that I was to come here clandestinely. I thought I was summoned openly."

"And so you are, dear love," said Annie, eagerly; "only have a minute's patience. I want you to myself for a little while—I want to tell you every thing—and then, if you say so, I will take you to papa. Louis—answer me the question I asked in my note. Was it Mr. Liddell who brought you that invention?"

She came close to him, and asked the question breathlessly, her eyes full of excitement, and her voice fairly quivering. She felt how much depended on his answer, how one word might overthrow all her tower of fancied proof, and she trembled even while she waited eagerly to hear that answer. After a moment it came—very slowly:

"I cannot answer that question, Annie, until I know why you ask it."

"Tell me, then, if you have ever suspected that this man—whoever he was—might really have stolen the invention, and been playing you false?"

tell him all—every thing. Necessarily, it did not take her long to do this, since the "every thing" was in itself very little. Then he caught her in his arms and kissed her as he kissed her on that April day when he came upon her with the news of his good fortune.

"You have saved me!" he cried. "You have given me the evidence I could never have gained for myself; you have cleared my name, and made me a free man once more. Oh, Annie, Annie, how can I ever love you enough?"

"Is it true, then?" she cried. "Was it indeed he? O Louis, I can hardly believe it! Oh, dear love, how could he be so wicked?"

"I have no doubt it was principally because he wanted to take you from me," said the young man, all in a glow. "But, however that may be, it was Liddell himself and no other who brought me this invention as his own. See, Annie, I have done as you bade me—I have brought his original draughts, and we will show them, and this ef-

"I dare him to deny that he took three designs."

Bernard looked disturbed, and tumbled his hair about in a way she well remembered before he answered.

"It is hard to suspect a man," he said, at last; "and I have been the more loath to do it, since I myself have tasted the bitterness of undeserved suspicion. But, since you ask the question, I must confess that doubts have come to me, doubts that, despite myself, have grown stronger since—"

He stopped abruptly, and Annie finished the sentence for him.

"Since you heard that I was to marry Mr. Liddell. Oh, don't start! It was not so—I am sure that I never would have done it—but that is what you meant, and now I know that he was the man. Stop, don't say any thing, Louis.—Look at this."

She put the drawing and the magnifying-glass into his hand, telling him, at the same time, how she had obtained the former. His eager astonishment was even greater than she had expected. It fairly startled her, as he turned, full of breathless impatience, and bade her

face drawing, to your father. Do you think he will believe me then?"

"Heaven only knows—but we will go and see."

Without giving their courage time to ebb, they gathered together the papers and crossed the passage to Mr. Gordon's room. When Annie knocked, her father's voice bade her "Come in," and, when she opened the door, she found, to her consternation—for she had neither planned nor wished any thing half so dramatic—that Liddell was with him.

There was a moment's pause on both sides—a pause of surprised and awkward uncertainty—before Mr. Gordon rose and addressed his daughter, his face flushing with anger, and his voice trembling with indignation.

"What is the meaning of this, Annie? How dare you insult me by bringing that—that thief into my presence?"

Now Annie had not meant to speak—that was to have been Ber-

nard's part—but this address naturally roused her, and, before the former could interfere, she had answered :

"Mr. Bernard is here at my request, papa. He wishes to answer the charge which you made against him eight months ago. It is now in his power to prove his innocence."

"Let him take the proofs of it elsewhere, then," said her father, coldly. "I have no interest in him or in them."

"What! you refuse to hear him?"

"Yes, I refuse to hear him. I have no desire to be duped by him again. I tell you what I told you eight months ago—choose between him and me. If you take him you lose me—that is all.—Mr. Liddell, shall we go on now with our business?"

Annie looked hopelessly at Bernard, but Bernard did not return the glance. On the contrary, he stepped quietly forward, and laid his papers on the table.

"Since you refuse to receive any proofs of my innocence," he said, addressing Mr. Gordon, with calm dignity, "I must ask you to examine these evidences of another man's guilt. You may remember that I spoke of a person from whom I received the original invention. In these papers you will find sufficient proof where he obtained it."

Mr. Gordon looked up. Apparently he was about to answer as he had done before, but something in the steady eyes of Bernard changed his purpose. He extended his hand and took the papers—hesitated a moment, and laid them down.

"It is quite useless to bring me proofs against a man whose name I am not to know," he said, frigidly. "He may be merely an abstraction, invented to shield yourself."

"You are mistaken," said Bernard, quietly. "This man is no abstraction. He not only lives, but you know him intimately. In robbing you, he betrayed not only his own honor, but your friendship. Sir, examine these papers, and, when you have examined them, I will refer you to Mr. Liddell for the name of their author."

Again there was a pause—a pause in which all of the four might have heard the beating of their own hearts; then, not quite unexpectedly, Mr. Gordon broke forth, violently :

"So, you come here to clear yourself by insulting my friend under my own roof? There is the door, sir! Never let me see your face in this house again! If I had ever doubted your guilt, I should be sure of it now."

"Papa," cried Annie, suddenly springing forward, "you must—you shall hear him! This is more than unjust—it is outrageous!—it is what you have no right to do! As for Mr. Liddell, I dare him to look me in the face, and say that he is innocent! I dare him to deny that he took three designs of the invention from my portfolio, and that this is one of them!"

She laid her hand, as she spoke, on the erased drawing, and turned like a tragedy-queen upon the trembling man, who was forced to clutch a corner of the table, to save himself from falling. In exactly the same spot where Bernard had stood eight months before, when Mr. Gordon accused and condemned him, the really guilty man stood now, and strove in vain to steady himself—strove in vain to speak. Mr. Gordon was about to answer his daughter as he had already answered Bernard, when his eye followed hers, and, falling on Liddell, he stood confounded, and could not utter a word. Indeed, he gasped for breath, and felt for a moment as if the solid earth was sliding from beneath his feet. He was glad, just then, that Bernard placed a chair, and said, in something of his old voice, "Sit down, sir." Unconsciously he sat down, and, as he did so, Liddell looked up and spoke—hoarsely and with effort:

"You need not carry the thing any further, Bernard; I admit your proofs, and that is an end of the matter. I have no motive for concealment now. Mr. Gordon might believe me, but she"—he nodded toward Annie, but did not look at her—"is all on your side. I don't mind saying that I did it to win her from you, and, of course, I don't care about putting a bold face on it after—after what she has said. It was a dishonorable thing, I suppose; but it may be some excuse to say that I cared nothing about the money. I did it simply to get rid of you, and I think I would do it over again, with any hope of success. You may as well throw those papers into the fire, and you need not trouble yourself to pay any more of the profits to my account. I have touched my last dollar of the money; and the only regret I have in the affair, is—that this is all my fault."

With that, he turned and left the room—not one of the three uttering a word. Mr. Gordon was too much aghast; Annie was too

full of indignation; and Bernard, who was now master of the situation, felt too much contempt. So he went out in silence—an object more fit for pity than scorn; and, when the trio left behind looked at each other, they forgot him and all that he had caused them to suffer, in their sudden realization of happiness—happiness that had come as a free, bounteous gift from the same gracious Hand that can scatter the darkest clouds in a moment, and bring forth the golden sunlight undimmed.

CHRISTIAN REID.

WANTED, A HOME.

BY ANNIE THOMAS, AUTHOR OF "FALSE COLORS," "DENIS DONNE," ETC.

THOSE were the three words which attracted my attention when I took up the *Times* one morning, about a year ago.

"WANTED, A HOME.—A young lady, alone in the world, desires to enter a family as a boarder. Liberal terms offered."

There was a touch of pathos in the wording of this want that appealed to me, and I became nervously impatient for my husband to come home, in order that I might try to win his permission to write and offer the advertiser a home with us. We were young married people, blessed with an increasing family and a small settled income, and, as we had a large house and large expenses, it seemed to me that this would be the very thing to meet our wants.

Our house was situated on the landward side of a cliff that reared itself on the beautiful western coast, and the situation possessed many advantages. We were only a mile from a fashionable watering-place. The views from our windows are not to be surpassed for grandeur and wild beauty on the coast-side, or for sweet, smiling, peaceful prettiness on the inland quarter. And the interior was well arranged, and gracefully furnished. The only disadvantage, indeed, that the house possessed, was the great one to us of being a high-rented one, and of demanding rather a large establishment. However, if this young lady who wanted a home would come and pay us liberally, neither the high rent nor the large establishment would be drawbacks any more.

Now, for ourselves. We were, as I have said, young people, and our friends were wont to aver that we were very attractive young people. My husband was a junior partner in a good, old-established banking-house, and I was more or less well known to the public as a painter of scenes in domestic life, that always commanded good places in the exhibitions, and good prices. Notwithstanding this latter fact, we wanted more than we had, for I had not been able to work very much of late, and my three babies took up a goodly portion of the time that I ought to have expended on my bread-winning art.

As soon as my husband came home that night, I showed him the advertisement, and propounded my plan to him.

"It would be a nice addition to our little party if she's a nice girl," I argued, and he refused to admit that *that* was a reason for having her.

"We are very happy as we are, Flo," he said. "Our little party is too perfect in my eyes for me to wish to see it increased."

"But, Edgar, housekeeping on what we have is such hard work!" I pleaded; "and, if she would come to us and pay us liberally, what matter whether she is nice or not? We could endure her."

"If you take that tone, Flo, what's the worth of any thing but so much money as 'twill bring?" I may conclude that you've made up your mind to try the experiment," he said, laughing.

"Not without your permission—but it would be such a help to us, Ted!" I said, eagerly.

And then, with little more ado, we went into a committee of ways and means, and finally rose up with the determination to try how fortune would favor us with respect to this young lady, alone in the world, who wanted a home.

I wrote to the address she had given, and stated our terms as concisely as I could. I also mentioned our respective professions, thinking, with a justifiable pride in my own, that any cultivated girl could but be glad to be admitted as one of the family of an *artiste*.

By return of post I got a letter, acceding to my terms, and asking if she could come to us early in the following week.

"She doesn't say a word about references," I said, dubiously, as

I handed the letter to my husband. "What a pretty name she has—Isabelle Cleveland!"

"The pretty name mayn't be her own," Edgar said, laughing. "Well, little woman, you must gang your own gait; all I advise is that you don't let the account between you run on too long, or you may find yourself in the wrong box."

"She writes the hand of a frank, open nature," I said, reconsidering the epistle under discussion.

"Yes; it's good, bold writing," Edgar said, looking at it—"rather like a man's. However, deciphering character by means of calligraphy is all bosh; one of the cleverest, most original women I ever met with in my life wrote the most conventional, stiff, commonplace hand. We won't prejudge Miss Cleveland, though."

"And I may write and say she may come next week?" I interrogated.

"Yes, dear, if you're anxious to rush into your troubles so soon," he said, laughing.

"Oh, Edgar, I won't foresee 'trouble' in the matter at all!" I remonstrated; "she is going to pay us so liberally that my load of housekeeping care will be lifted off my shoulders at once, and, additionally, being a young lady, she may turn out a most delightful companion for me. I won't foresee trouble."

"And I hope you won't have any, dear," he said, lightly; and then he went off to business, and I went over my house to see about making it put on its fairest aspect in the eyes of our new inmate.

My house was a very pretty one, and I was fond of it, as women are fond of the homes in which they are happy, and which they have arranged in a great measure according to their own taste. It always gave people blessed with the "artist's eye" the impression of being well furnished, though an upholsterer would have deemed it wanting in much that the upholsterer's mind deems strictly essential. For instance, the carpets and curtains, the chairs and couches, were no longer new and bright and fresh. But the colors of all had been chosen judiciously, and, as now their first bloom was brushed off, there was a harmony of tint about them all that often made me find other people's furniture gaudy and glaring.

My drawing-room was my special pride. It was a long, lofty room, with a fireplace at either end, and two large bay-windows in the side. It was papered with a delicate gray-and-gold paper, and the windows were draped with some soft-textured green material. There were a number of incongruous arm-chairs and easy-lounges about, some covered with rose-and-gold-colored satin, some worked in wool, and some modestly clothed in brown holland. And these all stood out in clear relief on a dark polished floor, for economy and taste had combined to make us adopt the foreign custom of dispensing with a carpet. There were several quaint and beautiful cabinets, filled with old china and glass, and one that we called "the children's cabinet," in which were displayed the silver goblets, and ivory-bound books, and other pretty things that had been given to our babies. And the walls were hung with five rare old Venetian mirrors, a few good photographs and engravings, and several good specimens of Oriental and old French china plates and dishes, that were fastened up in a peculiar way with fine wire, making spots of "color" on the delicately-tinted paper that were delicious to my eyes. Additionally, there were large and admirable copies of the Venus de Medici, the Venus of Milo, the Apollo Belvedere, the Clytie, the Ariadne (Dampiers's), and other masterpieces of ancient and modern art, disposed about the room on pedestals. And there was one magnificent bronze—the pride of my heart—standing on a handsome marble pedestal in a corner that was sacred to herself—"The Abandoned Ariadne," a marvel of Barbi-dienne's—that glorified the room to my mind.

Scattered about, in a profusion that I had too correct an eye ever to suffer to degenerate into muddle, were Chelsea china-figures of a good period, old German and Italian glass jugs, and vases, and goblets; an Indian casket, in ebony, wonderfully carved, little tables of various shapes, ivory ornaments, feather fans, crosses on brackets in white and colored marbles, from which were suspended silver crucifixes and rosaries, and flowers—flowers everywhere!

In pots on the piano and the cabinets, on big old china plates on the polished floor, in baskets suspended from wire over the square opening that was made by the taking down of the double doors, in slender glasses—wherever, in fact, I could find a resting-place for them, my love of flowers induced me to put them. My room, as will be gathered from this description of it, was very pretty and very

artistic, and it must be owned that I was justified in anticipating that it would strike the young lady who wanted a home very favorably.

What pains I took with the bedroom that was to be assigned to Miss Cleveland! It was a splendidly-proportioned room with matchless views from both its windows, and it was furnished comfortably as well as elegantly. With my own hands, I removed every particle of dust that had been left on the furniture by my less observant housemaid. Carefully and thoughtfully I dressed the two vases with flowers, one for the centre-table, and the other for the mantel-piece. Hopefully I arranged the minutiae of the dressing-table, so that the girl who wanted a home might feel that her comfort was studied in the one she had chosen.

The day appointed for her arrival came, and I could not settle to my usual work at all, so impatient was I to see her. A dozen times I placed myself before my easel, and feebly essayed a few strokes with my brush. A dozen times I gathered my babies about me, and strove to amuse them, and failed; for my heart was not in my task this day, and children are so quick to discover that fact. I dispensed with luncheon altogether, in order that my cook might devote all her energies to the elegant little dinner I had ordered for seven that night. And, as may be supposed, my unusual excitement, idleness, and abstinence, made me feel very tired and low-spirited and nervous before Miss Cleveland arrived.

She came at last—about three o'clock in the afternoon. "A horrible time for any one to choose," I thought, discontentedly, as news of her advent was brought to me; and then, before I had time to do more than feel that I was a touch less well dressed, a trifle less composed, a shade less well-prepared in body and mind for her than I would like to have been.

I confess to having been staggered out of these feelings most abruptly when she came into the room. In place of the fragile, shrinking, rather sorrowful-looking girl whom I had pictured to myself as wanting a home, I saw a fine, splendidly-arrayed woman, a year or two my senior. I rose to greet her with a grasp, and she advanced to meet me with a sweeping courtesy, that made me feel very much at a disadvantage, although I was planted securely on my own domestic heights.

"I hope that we shall get on well together, and soon become very good friends, Mrs. Forrester," she began at once, and I felt that I ought to have said *that*, and that she was robbing me of my prerogative of giving the initiative.

"You seem to have a very nice place here," she added, graciously, and then she threw off her hat and cloak, and I saw her as she was—one of the prettiest women I ever saw in my life.

Pretty in such a thoroughly comfortable way, if I may be allowed the expression. Plump and comely, this young lady who "wanted a home" had assuredly never wanted any thing in her life, without having it immediately. A fair embodiment of success and satisfaction; and yet, for all that, a woman with "a story," I was certain—a woman who was not quite what she seemed on the surface. A yellow-haired woman with brown eyes, and a perfectly-clear rosy complexion, with something not anxious but interrogatory in the brown eyes though, and with something that was not quite suspicion, but that might possibly develop into it, in the rapid glance and turn of the head. As I looked at her, I became feverishly anxious to have my husband's judgment upon her, and, when he came home, he gave it to me without reservation.

"Well, Flo, I don't want to dishearten you, poor little hard-working woman, but before you have done with her you'll regret the hour that made you acquainted with Miss Cleveland, I fancy; there's something crooked. Has she offered any solution of the mystery of her loneliness?"

"No," I said, hesitatingly.

"It strikes me that she has come down here with some other object than the avowed one," he said, meditatively; "however, if you're satisfied, little woman, I ought to be, I suppose; so we'll make up our minds not to meet trouble half-way."

Trouble came fast enough; there was no need to go half-way to meet it. It commenced in this way. I have described my incongruously-artistic drawing-room, and my pride in it. Well, Miss Cleveland elected not to "find it quite what she expected when she agreed to my terms; she *must* beg that I would put a carpet down; that slippery, cold floor made her shudder."

I apologized, pleaded, protested, argued, and finally effected a com-

promise. She would be contented with a Persian rug or two; but they "must be good." So I expended a small fortune in three, and hoped that her demands had come to an end. Not at all! She had "been fastidiously and delicately brought up," she said, "and naked images" (thus she designated my beloved copies from the antiques) "made her shiver." With all an artist's fervor, I became counsel for the defence of their purity and excellence of purpose in design. But Miss Cleveland added blushes to her previous shiverings and shudderings, and I had to give in. My statuettes were removed to my husband's study and my own bedroom, and I hoped that Miss Cleveland's scruples would *requiescat in pace*.

For a few days this seemed to be a well-grounded assumption, and my bruised spirits recovered themselves sufficiently for me to tell my husband that I forgave the overthrow of my lares and penates, in consideration of the sensible relief from the addition to my household purse of what she paid me. He laughed and shook his head, and bade me "wait and see, before I went over unreservedly to the enemy."

How can people bring themselves to speak lightly of what they term "minor miseries?" Those that I was called upon to endure would come into that category, I suppose; but what excruciating wretchedness they caused me! I grew nervous and irritable, unfit for my work as a mother, wife, and artist. But I endured on hopefully, and contrived to make my husband believe that I found compensation for the ills I endured in Miss Cleveland's society.

About a week after the copies of the antiques had been condemned to beat a retreat, I went down to the drawing-room one morning, and found Miss Cleveland sniffing the air with a deeply-aggrieved expression in her fine brown eyes.

"Is any thing amiss?" I asked, tremblingly, and, without hesitation, she told me that there "was something very much amiss. She had serious doubts about the plants."

"The plants!" I exclaimed, looking round anxiously at my healthy green friends. "They are doing beautifully; my plants always flourish."

"Ah, but they flourish at the expense of the human beings who live with them. I'm sure," she said, with some vehemence, "I have read in some medical work that they actually rob us of the oxygen we ought to take in when they thrive; and, when they don't thrive, your own common-sense will tell you how bad it must be to live in a room with decomposed vegetable matter. Besides, they harbor dust and insects."

After a brief argument, I gave up the contest. I consented to sacrifice the loveliest ornaments my room could boast of, and, when I had done it, Miss Cleveland triumphantly substituted some abominations made in wax.

"I think you're a goose to put up with it, Flo," Edgar said to me.

And for answer I reminded him that we had three small children, and that Miss Cleveland paid us at the rate of four hundred a year. Or at least that she was to pay us at this rate according to our agreement, and I had no fear of her falling short of it. She had a fine, lavish way of spending her money on any thing that struck her taste, that confirmed me in my belief that she was a very rich woman, although no coin of the realm had passed between us yet.

A thrill of suspicion would pass through my mind at night sometimes as I was lying broad awake. But, in the garish light of day, she looked so very frank, and fresh, and fair, and above-board generally, that I could not doubt her.

"We shall get the money all down in a big lump at the end of the quarter probably."

"I hope we shall," he said, dubiously. "Meanwhile, dear, we must pay for the Persian rugs; she has 'exquisite taste,' no doubt, as you're always saying she has, but I wish it wasn't quite such an extravagant one."

Time went on, and Isabella Cleveland had become very much one of us. Under her auspices my house had assumed an appearance of luxury and splendor which it had certainly been lacking in before. But the art-aura had fled from it. It was strictly conventional now in all its arrangements—strictly proper, and comfortable, and conventional. But it had lost its look of individuality, and the process by which it had lost this had plunged us very deeply in debt.

At length I gathered up my courage, and spoke to her on the dreaded subject of payment. I well remember the morning on which I burst the bonds of silence. It was a summer morning, and at

breakfast she had suggested a number of expensive alterations in the garden and conservatory, which, if carried out under existing circumstances, would, I felt, half-ruin us. Under the influence of this terrible conviction I spoke.

"Belle," I said (we had grown so intimate and fond of one another that we had fallen into the womanly weakness of Christian-naming one another)—"Belle, I really can't have any more beds cut in that lawn."

"Yet you pretend to be so fond of flowers?" she said, in some surprise; and I felt some embarrassment in explaining to her that I was "fond of many things that I felt I could not afford."

"Do you really mean that?" she said, looking at me dubiously, in some distress.

"Indeed I do," I said, dejectedly. "Ted and I have had a hard fight of it, I assure you; our expenses are heavy, and our ready money is short."

She looked wistfully away out of the window for a while, and then she turned to me and asked, in an altered tone, if a "little ready money would be of any service to me now?"

"If you could let me have just the quarter," I said, with a spasm; "it would be very nice, very convenient, very helpful, to me, indeed!" I blurted out at last, and I almost stiffened with horror when she answered:

"Mrs. Forrester, I can't—I can't!"

"Not just yet, is that it?" I asked, in the weak hope that she was only sorry to be obliged to defer payment for a day or two.

"Not at all," she said, miserably. "I have been trying to make up my mind to tell you this, and I have put it off, thinking you were rich people, and it didn't matter."

I think she saw the shiver that passed over me as I reflected on all the consequences her imposture would bring upon us. A hideous array of unpaid bills stared me in the face, of unpaid bills that were to have been paid with that money which she had agreed to give us, and which would never be paid now. In the bitterness of my spirit I let my head droop down into my hands, and sobbed a weary, tired, woman's sob of hopeless helplessness.

"Look here," she said, at last, in a quick tone, that made me glance up, "I will tell you my story, and you shall judge for yourself which is the most wronged and the most to be pitied of us two. If I have run you into expenses that you can ill afford (and I see that I have done that now), I can help you out of them; but the wrong that has been done to me no one can right. Listen."

"Miss Cleveland, I am in no mood to listen to a tale that you will know how to tell to suit your own purpose," I said, bitterly. "I have been straining every nerve to better the condition and prospects of my poor little children, and you have ruined them!"

"Flo," she said, with passionate energy, "don't say that. I will give you every jewel I have, and they will more than discharge my debt to you; don't say I have hurt you by injuring your children—I have children of my own!"

"You, Miss Cleveland?"

"I am not Miss Cleveland at all," she said, impatiently. "Listen. I said I would tell you my story, and I will tell it, however much it hurts me. When I came here four months ago, I came full of hope; I go away full of despair."

"Where is your husband?" I asked.

"In his grave," she answered, laconically. "I'm not a runaway wife; my children are with his mother, poor little things; it was for their sakes that I did what my soul abhorred—played a game of systematic deception."

"When my husband died I was left with forty pounds a year, and four children to support on it. That is three years ago now, and at that time I believe I had beauty. At any rate I was told that I had, and I was sought for it, and for it only, I believe now, by a man who had been my husband's friend, and who then professed to be mine."

"I won't tell you his name, but I will tell you this, that he is a man well known in the legal world as one of the most powerful pleaders for women at the bar. I appealed to him for the sake of his old friendship for my husband to get me a situation as a governess or a companion, or to help me to start a boarding-house—to do any thing, in fact, that might help me to maintain my poor little children. And he affected to shrink with horror from the thought of my doing any thing of the sort. 'It was not fitting;' it 'was incongruous,' he

declared. And at last, about six months ago, when I was in very deep distress, he asked me to be his wife.

"He is a rich man, and I at once asked him if my children should be his, should share his property, should be educated as it behooved him to educate *his* children? And he said 'Yes, when once we are married, every thing in that way shall be as you will; but we cannot marry yet. I am engaged in a case in which I have employed all my eloquence, to throw obloquy on a woman who takes a second husband; but these cases are soon forgotten, and then, dearest, your trials shall be at an end.'

"I did not like his argument, but I was poor, miserably poor. Oh, Flo! you who have a husband to fight for you and your children if the worst comes, don't know what I felt that day when he put me into a path of deceit, and bade me follow it for my little ones' sake. He engaged himself to me solemnly, he bound me to him, and then he counselled the strictest secrecy respecting our engagement. I was not to let it be known to a single member of my late husband's family, because 'they had prejudices, and were friends of his,' he said. And I swallowed *that* pill for my little children's sake.

"I was staying with my late husband's mother at this time, and my prudent lover at length objected to this arrangement. It placed him 'in a false position when he visited the family,' he said; he was afraid my looks and manner would betray me, and, for the sake of the future, there must be no quarrel. These and sundry other arguments he used with such effect that at last my mind was open to the reception of the suggestion that I should seek a home somewhere else for a time, in order that there should be no fear of our relative positions toward one another becoming known, until the recollection of the *cause célèbre* in which he was engaged had faded out of the public mind. Then it was that I advertised (under his orders), and then you answered me, and I came here.

"He supplied me with funds at first" (a scorching blush passed over her face as she said this), "telling me that, as I was to be his wife, there was nothing in his doing so. And I came down here, my mother and sisters-in-law all thinking that I was coming as governess to your children, and applauding me for my independent spirit—"my independent spirit," when I was meanly deceiving them all at his bidding!

"Well, I came here, as you know, came in a sort of dream, and left my babies with their grandmother; when I got here I wanted distraction, and, as he had promised to pay the terms you asked, I felt justified in suggesting alterations and improvements that passed away the time. But only last week I had a shock—a letter came from my mother-in-law, telling me in simple, gratified language, that *he*, the man whose wife I am pledged to be, is paying his addresses to one of her daughters!

"Mrs. Forrester, often when I have found fault with things, and asked for them to be changed, I have been half wild with doubt and suspense, and have only found the fault in order to divert my own thoughts from that which they were always dwelling on. I have behaved miserably ill to you, I know; but only think how *I* have been treated!

"I wrote to him at once, on receipt of my mother-in-law's letter. I only wrote these words, 'Is it true?' I knew that his cleverness and his conscience would fill up the blank. And to-day I have heard that it *is* true; and my poor children write to me through their aunt in ecstasies about the kindness of their new uncle. Mrs. Forrester, which of us is the one most to be pitied?"

I was in deep household distress myself, but, when I looked at the gray, haggard look which had crept like a cloud over her brilliant beauty during the narration, I could not conscientiously lay claim to competing with her in misery. I still had Edgar to turn to.

"What will you do now?" I asked.

"Seek for a situation," she said, curtly; "do any thing—keep a shop if I can."

A bright thought struck me. I said to her: "Why should you not turn your bonnet-making talent to account? take one room in the town for a show-room until your bonnets remunerate you, and stay with us till you can afford a house of your own."

"You won't turn me out—you'll trust me yet a little longer?" she said, with tears in her eyes.

"Indeed, we will."

"Then I have an additional incentive to be up and doing," she said, rising up and throwing up her arms as if she was throwing off a weight

of care; "if you had turned against me it would have crushed me, I believe; but, as it is, I will work so well, and I will work at once—what will your husband say?"

"Being a man, he won't say that he always told me so," I said, laughing; "but he did think that a man would have gone to work in a more business-like way than I did."

"And if you had gone to work in a business-like way, as you call it, I should have been disentangled from my web of deception all the sooner," she said, thoughtfully; "it's too late now to tell you that honesty is the best policy; but, for your future guidance, Flo, let me tell you that it was the touch of pretentiousness in your manner which misled me. I shouldn't have put you to such expenses if I hadn't fancied that expense was no object to you."

My tale is told now. "Miss Cleveland" was put on her metal to redeem herself in our eyes, and, as she had no fancy to be regarded as an adventuress, she did it nobly. Her millinery establishment is the first in the town now, and people who are not in our secret wonder how it is that she always takes care that unimportant I have the prettiest and newest of her bonnets and mantles. Her children are under her own wing now, and she looks back with a shudder to the time when, "for their good," as she thought, she was ready to sacrifice herself and their father's memory to the heartless man who led her into a false position.

As for ourselves, we have never answered any more advertisements; and, as the children are growing up, I am able to decrease my establishment, and work harder at my art. I have sold off the Persian rugs, and reinstated the Venuses and plants, and my drawing-room is again the delight of my eyes and the pride of my heart, the head-centre, so to say, of all manner of unconventional incongruities. Whatever my difficulties with my bills are now, I refrain from mentioning them, for fear of Edgar counselling me, with a laugh, to take a short cut to fortune by looking out for a young lady who wants a home.

AN ALGERIAN INTERIOR.

[WITH AN ILLUSTRATION, PAGE 241.]

OUR fair readers, who glance at this vivid picture of the domestic life and labors of one of their Eastern sisters, which the pencil of the famous French painter Brun has reproduced with photographic accuracy, will doubtless be much surprised to see how she manages to keep both hands full. The ordinary estimate of the Eastern woman is as much too low as the poetic one in the days of Moore and Byron was too elevated. While the Nourmahals and Zuleikas are rarely to be met with in lands where woman is not permitted to rise to the level of her happier sisters here, and lacks usually both education and refinement, yet it is equally unjust to regard her as the idle voluptuary and "soulless toy for tyrant's lust," which modern tourists, ignorant equally of her land and language, have been pleased to depict her.

There, as here, the life of the rich and poor is widely dissimilar; and, while our Fifth-Avenue belle—gaudy butterfly of the species—may find her parallel in profuse expenditure and idleness in the harems of the East, equally may be seen the "busy-bee" type "in the huts where poor men lie" in both hemispheres. While no life can be lazier than that of the pampered odalisk of a pacha, none can well be busier than that of the toiling mate of the Eastern working-man, or even of a class above him. Our picture represents the daily life of a woman of Constantine, in Algeria, at her in-door work, and gives a history at a glance. She sits on a small divan let into a niche in the wall, and her dress indicates a woman considerably above the lower class—most probably the wife of a respectable tradesman. The ladies will remark that her ear-rings are of the shape and size now fashionable here—another proof how much the West is indebted to the East—while in her sitting position the cut and fashion of her dress does not differ materially from that of our "softer sex" here. Were she to rise up, however, their *continuations* would display baggy trousers in place of the flowing folds which terminate female drapery in Christian lands.

By an ingenious contrivance she is doing double duty—rocking her child's cradle with her right hand, while her left is busily stirring the savory compound of goat's-milk and rice, which is slowly simmering in an earthen pot over a charcoal fire placed in the bottom of another brazier of similar material. The milk-pan, and the pestle and

mortar in which the rice has been pounded, stand beside her. On the floor are to be seen, strewed around the wicker basket brought from market, the vegetables which are to eke out the frugal meal, and which are awaiting their turn for the cooking process on the very primitive kitchen-range now occupied by the milk-and-rice.

The broom of rushes in the corner tells a tale of well-swept floors, which are of stone, and innocent of mat or carpet. The small water-goolah, of the shape as common to Egypt as to Algeria, made of porous earth, is substitute both for pitcher and glass. These are the simple appliances of her housekeeping, but they seem sufficient for her comfort, judging from the placid and contented expression of her face. That face is thoroughly Oriental both in its type and expression, and the languor and repose stamped on its children by that sensuous climate are strongly indicated both by the attitude of the woman and the dreamy expression of the large dark eye, even in the midst of her manifold domestic duties.

There are few housewives, in this busy land of ours, who could preserve such serenity of face and ease of attitude if called on to do double duty as cook and nurse at the same time; and yet the cookery will be unexceptionable, and the cradle rocked as satisfactorily as though the matron were to fret herself into fever, and wear her smooth, round face into the sharp, eager outlines of a bustling *mater-familias* in New England. With that strange mixture of squalor and discomfort with luxury which marks all Eastern interiors, over the child's cradle is thrown, as a coverlet, a shawl, which most probably is a Cashmere, which many a New-York fashionable, living lavishly, would not feel rich enough to purchase; and the bracelets and earrings worn by the women may be of solid gold, while all the wealth of her husband may be invested in the gold coins plaited into the thick braids of her "back hair," where our fair ones wear no "pearl of price" richer than the mystic, much-abused chignon.

Although the law of Mohammed, which is the law of the land throughout the wide and varied population of Islam, allows plurality of wives, yet, either from some natural impulse inherent in human hearts, or from motives of economy, that privilege is one which few but the very rich avail themselves of, and most men have but one wife at a time; for a facility of divorce, more facile and fatal under Mussulman law than even Indiana may boast of, permits men there to change their mates as often as their inclination may suggest. But this license is checked by the financial consideration arising from the obligation of making provision for each and every wife divorced and her offspring, so that, as before observed, plural wives are luxuries reserved for the very rich alone, and even they often honor polygamy "more in the breach than the observance." Let us hope, therefore, that the industrious lady of Brun's picture may bear undisputed sway over the household to whose comfort she is so well contributing.

THE BRITISH CIVIL SERVICE.

THE British civil service, as it is now, was organized in the year 1855, under the premiership of Viscount Palmerston. The principles upon which it was reformed were, that for all the offices coming under the designation of the "civil service," there should be a "limited" competition; and secondly—the most important rule—that all nominees should be subjected to a rigid examination on certain specified topics—these topics being different for the different departments—before receiving an appointment. With a view to carrying out this system with the requisite efficiency, a civil service commission, comprising four or five men of high ability, learning, and integrity, was established, and the control over the examinations and the decision as to their results was given to them. The specific duty of the commission was stated to be "to examine candidates previously nominated by the heads of the executive departments." With this view they were required:

1. To ascertain that the candidate is within the limits of age prescribed for the department to which he desires to be admitted.
2. To ascertain that the candidate is free from any physical defect or disease, which would be likely to interfere with the proper discharge of his duty.
3. To ascertain that the character of the candidate is such as to qualify him for a public appointment; and—
4. To ascertain that the candidate possesses the requisite knowledge and ability for the proper discharge of his official duties.

The commissioners are provided with the requisite powers to apply these four tests. To prove age, the candidate must produce duly-certified copies of registers of births, marriages, and deaths; to prove health, he must undergo a medical examination, and thereon produce the certificates of well-known physicians; to prove good character, he must produce certificates from clergymen and other well-known persons; and to prove knowledge and ability, he must undergo an examination duly prescribed. The commissioners are brought in relation with all the departments of the administrative service; the heads of departments frequently, as a fact, delegate to them the power as well of original nomination, as of ascertaining the competency, of candidates; they are authorized to exclude manifestly incompetent candidates from examination; they are empowered to appoint assistant examiners to aid them; and they hold their office during "her majesty's pleasure."

These, in brief, are the powers and position of the civil-service commission. Considering the civil service itself, we find that the term includes all the official servants of the government, excepting high special officers, such as cabinet-ministers, hereditary or other high officers of the royal household, and so on; the officers of the army and navy; and the inferior grade of servants who receive weekly wages. In the wide range of civil-service officials—extending, as it does, from permanent secretaries of departments to junior clerks of admiralty, messengers, and post-office employes—there are very many grades in dignity and pay, and in social position. "Rates of pay and kinds of work," says an English writer upon the subject, "differ as widely (as well as social position) as those of a lawyer's clerk from a queen's counsel." In a country like England, where social distinctions are so broadly marked—a country of classes and ranks, where the social steps are like the rounds of a ladder—it is important to discover the social dignity of this or that employment. Again, there is a prevalent idea in England that hard work and gentlemanliness are more or less incompatible; and, followed out, this idea leads to the kindred notion that the less the work, the greater the gentleman—the very highest social grade being that of the *fainéants*; the lowest, that of the toiler for fourteen hours a day. Judged by this rule, the civil-service clerk occupies a higher social position than the commercial clerk, a somewhat inferior position to the army-officer. His work is, however, becoming more and more absorbing, as there is now, much more than formerly, great activity in English administrative and economical reform. He formerly held almost a sinecure; now he must labor steadily throughout the hours prescribed by the rules of his department. Although he is never overworked, he has no time on his hands to give up to idleness. The excise-officers, indeed, complain of being overworked; and their complaint has been recognized as just. Mr. Anthony Trollope said of them that they were expected to be "half a Hercules, half a Minerva." But the ordinary department-clerk has a quiet, secure, not too laborious office, with the advantages of a continuance of salary when sick, and of a comfortable pension in his declining years, when he has ceased to be able to fulfil the duties of his office. He is free from anxiety.

No English clerk is ever removed except for grave cause, and even then not until the matter has been fully and judicially investigated, and the official has had ample time and every facility to defend himself from the charges made against him. This is a strict rule, inviolable, with no exceptions. To remove an efficient officer, even the influence of a minister of state, or a royal duke, is unavailing.

Probably the only evil of this is, that those officials who are on the border line between competency and incompetency—who are not very efficient, and yet are not inefficient enough to warrant a judicial inquiry, must be retained to the detriment of the public service. To avoid this impregnable inefficiency, every caution is taken that, before officials actually enter upon the service, their capacity and character shall be proved. The burden of proof is not upon the commissioners, to establish the inability of the candidates, but upon the latter, to prove their ability. The examination is, as has been hinted, a competitive examination. When a vacancy occurs in any of the departments, the head of that department nominates three candidates for the place. He has either selected these from among those whom he personally knows, or upon the recommendation of a peer or a member of the Commons. An M. P. is usually able to obtain such a nomination, especially if he belong to the prime-minister's party. If a member makes the application, and the minister grants it, the name and address of the candidate are set down in his list for nomination, upon

a vacancy arising. But months, and even years, may elapse before the nomination is actually made. Sometimes the minister makes nominations upon applications backed up by sufficient influence. "The effect of a nomination," says an authority, "gives the candidate a *contingent* right to an appointment, which, if he succeeds in satisfying the commissioners on the four points of age, health, character, and knowledge, in examinations, becomes a *vested* right; but not before."

There being but three nominations for each vacancy, the competition is evidently a limited one. An agitation has, however, been for some time going on, in England, to break down this limitation, which preserves the offices too much to the nobility and higher class, and to establish, in place of the present, a perfectly free or open competition. Such a reform, indeed, is said to be actually under the consideration of the present ministry. Should such a measure be determined upon, the son of the poorest English laborer would have the same chances of an appointment as are now possessed by the nominees of ministers, peers, and members of Parliament. The change would be radical, and, we believe, too democratic, to be entertained even by a household-suffrage House of Commons. Still, the probabilities are, that the present restriction will be made broader, and that some device will be adopted for giving a better chance than now exists to competent youths who have not the good fortune to be smiled upon by chancellors of the exchequer, country gentlemen who sit at St. Stephens, and peers of the realm who have done England the honor to be born.

But the system of 1855 is a great advance; before that, the minister appointed, and the appointee entered at once upon his official duties, without examination or certificate of any kind. There was no limit of age, capacity, or character.

The examination is a very real, stringent, searching one. No man can pass it who is incompetent to serve in the department for which it is established. The papers are such as would tax sorely a two-years-graduated A. B. of Yale or Harvard to answer. Not only does the examination ascertain the comparative merits of the three competitors for the vacancy, but it absolutely requires as well qualifications which fully come up to a certain fixed and positive standard. A certain number is taken as that standard, and the candidate must, on all the subjects taken together, average this number on the examiner's report. The examination follows in a few days after the nomination. In some cases, the candidate is nominated to a preliminary "test" examination, and, if he fails in this, he does not proceed to competition. It is stated that most of the candidates who are rejected fail in spelling, handwriting, and arithmetic—that comparatively few fail in English composition, geography, or Latin. According to the commissioners' report for 1864, it appears that in that year, out of eight hundred and thirteen competitors, two hundred and ninety-four fell below the minimum standard of a passed examination. Out of twenty-three hundred and thirty-four rejected candidates, from 1856-'64, all but one hundred and eighty-three failed in orthography or arithmetic. The total number of competitors for civil offices, from 1856 to 1864, was over twenty-five thousand.
